The department of agriculture at Washington, D. C., has issued Bulletin No. 804, five cents. It is entitled "A Study of the Behavior of Bees in Colonies Affected by European Foul Brood."

The brood diseases of bees cause annually large losses of bees and consequently of the honey crop.

The predominant attitude among beekeepers has long been how best to eradicate an invading bee disease after the attack has been made. They depend upon this procedure because little is known with any degree of certainty concerning the natural conditions which might prevent or control the onslaught of the disease. As a result of this attitude much more importance has been placed on the significance of apiary inspection and police power laws and of purely remedial treatment, the reasons for which in many cases are imperfectly understood. But the old adage, "An ounce of prevention is worth a pound of cure," has yet to be refuted, particularly with regard to beekeeping. In the realm of human medicine, for the last two decades at least, this precept has been gaining strength, so that today preventive medicine stands on a par with, if not above, most of the other branches of medicine. Why is it not logical to apply this principle to the control of bee diseases?

El Dorado County's pear crop has been slightly injured by frost but it is anticipated that sufficient remains for a fair setting.

A LIVE UNION

Secretary Hoyte of the Farmers Educational and Cooperative Union of Stanislaus County writes as to the activities and meetings of the Union being held in that county. He says:

"The Farmers Union has taken up the matter of a pure seed law for California. We advocate one with real teeth in it, espccially as regards alfalfa and potato seed. Having had dumped in this county a lot of imported alfalfa seed which contained as many as 3,000 noxious weed seed per pound, with a germination of less than 50 per cent, we realize the need of such a law. This seed was obtained by the dealer at a cost of 17 cents per pound, laid down; the farmer was charged 40 to 45 cents, which we claim is unjust.

"The condition of our potato seed and the condition of most of the potato land in California, you know, I suppose, better than I, and the need of some just legislation that will protect the public from unscrupulous dealers.

"All of our reliable seed companies, I am sure, would gladly welcome such a law.

"We would be thankful for any aid you could extend to us in the work of stimulating production, education, cooperation, and the good of the general public, not forgetting the consumer, who we all know is as essential to us as the growing and selling of better crops.

"We will soon be showing at each of our locals, through the University of California service, moving pictures of things educational in farming, hoping thereby to secure aid in getting members.

"Our organizer started work in this county last month, and we have increased our membership well over 200 in only a small part of the county. We now contemplate putting five organizers in the field at an early date.

"Our county convention will be held at Turlock on April 21, at which time we hope to have a resolution adopted by all of our members (and any other organizations that will help), and start this much needed law on its way to its proper destination in Sacramento.

"Being a strong supporter of your paper, the California Cultivator, and heartily agreeing with its policies, we hope you may be able to assist us through the columns of your valuable paper."

BLASTING CLAY SOILS

In connection with subsoil blasting of clay there is one feature often overlooked that is of the greatest importance. A clay soil naturally is rich in unavailable plant foods, but owing to the puddled and solid condition little of its fertility is available. How the condition came about is not so important as is the fact that there is little humus in the under soil, less bacterial action and poor drainage, while aeration and oxidation hardly take place at all.

It would seem that nearly every other agency of fertility waits on humus in such a soil. Given humus, in the form of roots that penetrate, or even in the slow arriving form of particles carried down from the surface by water, chemical reactions set in that eventually lead to better conditions. When a heavy crop of roots is made to grow down in one season and their bulk is supplemented by a good crop of stalks and leaves plowed under, the "sad" clay soon becomes mellow and productive. To put it another way, crops, even trees, will not send roots into unbroken, compact clay, simply because there is no inducement to do so. They have the ability to penetrate such clay, but there is no available plant food in it for them to travel after.

A way to start the upbuilding or enriching process with a rush is to open up the clay, fine it and loosen it and force the growth and introduction of organic matter. In old gardening practice we used to trench the ground, beginning at one side and working across, and going down two to four feet. In commercial gardens and orchards trenching is too expensive and blasting has been found to accomplish about the same results, its only fault being that it does not put the top dirt down and the bottom dirt up.

Owners of clay soils should make it a point, therefore, to put their clay subsoil in a properly granular conditioon. The impression is likely to prevail in many neighborhoods that blasting is not necessary or desirable for any soil that still is soft enough to break apart in the hands, but only for hardpan and other lightly cemented soils that resist the actual physical penetration of roots. This is an error. Penetration should be easy, but available plant food is more important, especially in clay, and it can be obtained in proper abundance within a few years only by trenching or blasting.

IT HAPPENED

This delightful little story we take from the Animals' Guardian, London, England:

In a Kensington by-way yesterday was a very ordinary hawker of rugs. His cart was commonplace, his horse work-a-day and possessing only one sound eye. The morning was cold, the little street deserted, and, to the seller of rugs, super-tax seemed a long way off. Not at all a good setting for a fairy act.

From a turning came an old man who asked to be shown "something nice and warm." The goods were spread out for his inspection but he was difficult to please. "I want something better," he said. "Why, there's the very thing—a thick, white fleece rug—quite the best you've got. How much?" And he pointed to the superior article, which was draped over the loins of the horse.

"Nothing doing!" was the reply.

"Come, I'll give you £5 for it," declared the old man.

"Can't be done, mister."

"Why not?"

"That there rug's the special property of old 'Wall-eye Jim,' the horse. Had it long before the war, he did. Keeps him warm on cold days. It's just been cleaned for him to wear this winter. He's been a good pal, and he'd never forgive me if I sold that—would you, mate?"

The aged horse swung his head round until his sound eye came into play, and, with, it, tried to express assent.

"Look here," the hawker went on, "you have this one, mister. It's the next best. Seventeen and six."

The old man took the rug, pressed a £5 note into the seller's hand, and, not waiting for the change, vanished.

To the empty street the hawker said "Blimy!" four times. Then he buried the note in a pocket of his third waistcoat from the top, adjusted the winter garment of "Wall-eye Jim," seized the bridle and started for home. "Come on, mate," he said. "You come and lie down in your stable and think it over. Blimy!"

Kern County farm bureau directors are indignant because the state railroad commission gave little heed to their protest against advancing power rates in the San Joaquin Valley.

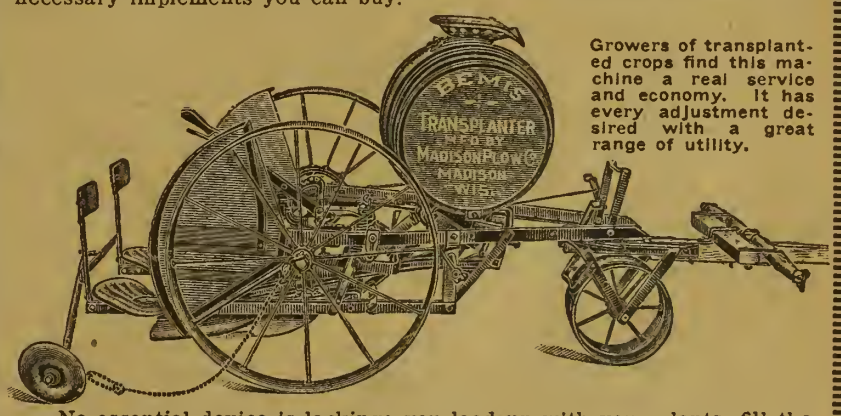
SAVE LABOR, TIME and MONEY
BY OWNING A
BEMIS TRANSPLANTER

The Bemis Transplanter is thoroughly practical horse power transplanting machine with every feature for every purpose and every adjustment desired for transplanting tomatoes, berries, small nursery stock, peppers, sweet potatoes, celery, cauliflower, cabbage and similar crops.

It has proven its great utility and value to hundreds of growers in every state and its construction gives such a great range of usefulness and such fast operation, that it is one of the most highly desirable and necessary implements you can buy.



Growers of transplanted crops find this machine a real service and economy. It has every adjustment desired with a great range of utility.

No essential device is lacking; you load up with your plants, fill the barrel, set the floating shoes and pressure plates, get on and go and go fast. Five acres a day or thirty or forty thousand plants set out in a day is no fast pace with a Bemis Transplanter, and it does the work so much better than setting by hand, that the increased stand and yield are also very important factors. A man and two boys can operate it successfully. The floating shoes, quickly adjusted, are independent of the frame, insuring uniform planting, regardless of holes or ridges in the ground.

The pressure plates pack the moist earth firmly around the roots and the watering device supplies the moisture. Dry earth is thrown over the surface mechanically. The spacing device enables the droppers to set the plants at equal distances apart, and the work is better than hand transplanting.

The driver throws the machine in and out of gear turning around, and can lock the front truck and insure straight rows.

With a Bemis Transplanter you can quickly set out a large acreage and you don't have to wait for a rain. The Transplanter stirs the ground equal to once cultivating.

Growers who have used the Bemis Transplanter say it insures better setting, better stand and better yield of crops. It has every feature for every purpose desired, and soon pays for itself.

For large truck farm in California. Good position to right man. Practical familiarity with commercial growing of vegetables essential. Scientific training desirable. Familiarity with packing and shipping of vegetables desirable.

R. L. Reynolds, La Habra, Cal.

When Writing Advertisers, Mention the Cultivator.

YOU CAN'T HAVE EGGS AND MITES TOO

Poultry men and farmers sometimes overlook a very important fact. It is that the best of feed, plenty of it, well balanced ration, etc., will not induce hens to lay eggs if they are compelled to roost in houses infested with mites. The little red insect saps the vitality of the hen by sucking her blood. Hens have actually been killed, virtually eaten alive, by mites. Chickens cannot lay except when their vitality is maintained. Vitality and mites cannot exist in the same hen roost. Guard against mites by giving all the woodwork inside the poultry house a coat of hot whitewash well carbolized.

The roosts and their supports should be painted all over with carbolineum, zenoleum, carpoline or kresol. These are similar products, called by different names by different manufacturers. They are cresol or tar oil disinfectants and are death to mites, while in no way injurious to the chickens. The time and cost of carrying out these suggestions will be amply repaid by the hens who will show their appreciation by an increased yield of eggs.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

Santa Cruz, week ending March 27.

D. B. Walls and Warren Wood tie for the week, each of their pens laying 54 eggs. The flock as a whole for the week laid a little better than 65 per cent. The high pens for the week are:

Wood, 54 eggs; Walls, 54; Barker, 53; Enterprise, 53; Bellows, 53; Stalling, 52; Neef, 50; Gibson, 50; Gray, 50; Gibson, 50; Amsbaugh, 49; Schlink, 49.

High pens to date: Walls, 843; Enterprise, 755; Neef, 748; Rose, 737; Wood, 717.

UNCULTIVATED LAND SEIZED

A royal decree has recently been made by the Italian government to provide for the necessity of increased agricultural production, with special reference to cereals, vegetables, and edible tubers. It has been felt in many quarters in the country that proper use was not being made of large tracts of land which had never been placed under cultivation, owing to the difficulties raised by the landowners in granting leases on adequate terms and to the indisposition of land-owners or the state to sink any capital for the development of such land. Expression to the prevalent feeling of dissatisfaction was shown on the 24th August by the organized seizure by a number of farmers of tracts of uncultivated land in 200 localities in the vicinity of Rome, chiefly at the instigation of the "League of Fighting Soldiers."

It was to deal with the situation thus created that the royal decree was issued. Under the decree farmers belonging to legally constituted agrarian associations are secured in temporary occupation of land concerning which questions of civil custom have arisen, for a period of four years. The land owner is to receive fair compensation, and when this cannot be decided by common agreement the matter will be determined by an arbitration committee. There is a right of appeal against a decision by this committee. Under certain provisos, framed in the best interests of land cultivation, application may be made before the termination of the provisional occupation for the occupation to be made permanent.

The decree also provides for the granting of state assistance where it is considered desirable, empowers agrarian societies to collect from their members payment due in respect of incoming subscriptions, repayments, etc., on the principle of the collection of direct taxes, and makes the minister of agriculture responsible for the supervision of agrarian associations and bodies.—Journal Board of Agriculture, England.

Unsigned communications receive no attention.

Swollen Ankles

I have a 15 year old mare mule that stocks up in hocks and ankles. She also has bad teeth and some difficulty in urinating. She weakens more than her team mate at the end of the day. She does not drag her feet nor seem extra stiff. After a day's work the swellings in the ankles sometimes go down to normal. I find that alfalfa, molasses and bran are the best feed for her. What would you advise doing for her?—Subscriber, San Bernardino.

You will have to get a veterinarian to fix the teeth. The trouble with the ankles is called lymphangitis. It is a defect of the lymphatic system in carrying off the worn out material. The feed of alfalfa and molasses is all right, but not the bran. Use rolled barley instead. Get half an ounce of aloin, four ounces of turpentine and two quarts of raw linseed oil. Mix all together and divide into eight doses. Give one dose each day while it lasts, unless it physics her too much; in that case give the doses farther apart. Also get four ounces of nitrate of potash, four ounces of bicarbonate of soda and six ounces of powdered gentian. Mix them and divide into 20 powders. Give one powder in the feed morning and evening

Ulcer

We have an 11 year old cow that is in good condition and giving plenty of milk. She has been tested for tuberculosis and is all right that way but has a sore just in front of her udder that we are unable to heal. We have washed it with disinfectant and used sheep dip, but it remains about the same. What could we use to heal it?—Subscriber, National City.

Those ulcers are a little hard to heal. Have your druggist dissolve two drams of chloride of zinc in a pint of water. Wet the ulcer with this solution morning and evening. Brush off the scabs so the lotion can get right on to the skin.

Household Department

THE 1920 FAMILY BUDGET

First comes the rent—32 per cent;
Your groceries are 20;
Your clothing bill is small, but still,
It's 6 per cent—that's plenty.

Insurance 4, cigars 2 more,
Amusements come to 7;
A tire, 15; 12, gasoline;
That's 98—Great Heaven!

It cost you 2 to have the flu,
And that all went for dope;
You owe the nurse, and what is worse,
The doc, too, lives in hope.

The butcher looks upon his books
And forthwith mails a dun;
The drygoods man your bill doth scan,
And so on, one by one.

Your wages spent—the last red cent,
In debt, and there you are.
Man toils and slaves but never saves;
He just must keep a car.
—E. D. Foster, in Weld County News.

SIR STUPE ID AND THE ROSEBUD CLUNA

(Continued from last week.)

Dorance an hour later was eating a piece of toast in the kitchen. Already she had stacked the castle's great cracked dishes on the upper shelves of the pantry and through the door was proudly looking at her own rows of pink and white china. Suddenly she ran to the window. A strange buzzing sound had for some time been filling the air. Dorance stared down the terrace in surprise and her eyes glowed. All the weeds had been cut away from the upper lawn and Stupe's fat body was trotting briskly along behind the mower.

The little cook clasped her hands as the sun came out and shone softly on the clipped grass where black and yellow birds were searching for bugs and tender tips. The birch trees which an old time Id had planted to outline the terrace now stood proudly with no long tendrils climbing their trunks.

"What a change!" breathed Dorance. "And so soon!" Her eyes twinkled.

As it was the first work Stan had done for six or seven years, he found it interesting and did not realize that it was two o'clock and time for lunch until his arms and legs hurt so that he could not push the mower. Then he stopped and looked back at the smooth terrace and grinned.

"Pretty good for me; I'll do all the grounds, but I must sleep the rest of today. Now for something to eat!"

He started toward the castle Hilga would have a dozen young rabbits stewed in vinegar, or a couple of fat geese stuffed with chestnuts. Stupe paused—Hilga! He had actually forgotten that there was a new cook, a slim little, trim little cook.

Dorance was standing at the dining room window. She smiled brightly.

"How splendid the terrace looks! You must be hungry; lunch has been waiting some time."

The giant sat down. There were sprays of lilies of the valley on the table now, and he sniffed toward the kitchen for the smell of his dinner above the perfume of the flowers. Then came Dorance with the tray and on it a plate of rolls, a small bowl heaped high with roast beef hash, a beautiful salad of lettuce and crimson tomatoes, a tall glass of iced tea and tiny twin molasses cakes topped with whipped cream.

It was enough for two ordinary men, but Stupe stared in dismay. Whose fault was it? Why, the dishes, of course. How could one expect that rosebud china to hold a couple of geese or a dozen rabbits? Stupe looked up at the beaming girl.

"Why—why don't you use our dishes?"

Dorance merely smiled.

"I told Your Highness that I must use my own. They were my mother's and I cannot work without them."

She disappeared into the kitchen and Stupe sat looking at the lunch. Then he tasted the hash. Delicious! If only the great Id tureen had been full of it with fifteen or twenty poached eggs for trimming—however, Hilga would be back in a week. The giant began to eat very slowly.

Directly after lunch he walked quickly out to the hammock and lay down. He pulled his cap over his eyes and prepared to sleep the day away. A moment later he pushed up the cap and gazed down into the orchard. How badly those trees needed pruning! Far down the hill Stupe could see the public highway winding around the castle grounds. At least it had been a highway once, but now it was rutted and choked with sand and there were weeds in the middle of the road. Without remembering that he had not begun his nap, to say nothing of finishing it, he jumped from the hammock and hurried over to the tool shed.

At seven o'clock the setting sun looked down in surprise upon the giant still hard at work. He had forgotten everything but getting the road finished. Three times he had been around it with scythe and shovel and roller until it lay like a curving grey ribbon. Now and then Stupe paused to look with pride toward the upper terrace, which still gleamed pleasantly green and smooth.

Three months later Hilga hobbled out of her daughter's comfortable home and through the streets toward the castle. There had been great talk about the goings-on in town and Hilga was walking so she could see with her own eyes. Had His Highness really headed a band of men to get the weeds from all the lanes and avenues? Had he himself cleaned up the parks? Had he sold his great flock of geese to the King of Kankaland and given a gold piece to each citizen who would paint his house?

Hilga during her long illness had listened jealously to the excited gossip, but now as she made her way to the main avenue, at the far end of which stood the castle, she cried out with pride. On either side the lawns were freshly cut and though it was early morning, women were out scrubbing the cream colored stone sidewalks.

A couple of blocks down, the stores commenced. Hilga forgot her tired feeling and almost ran toward them. Could it be possible—clerks busily.

A FINANCIAL PARABLE

By Strickland Gillilan

And it came to pass in these days that there dweit in the land of peace and plenty a (tolerably) certain man who obtained possession of one dollar, yea even an kopeck, an seed, an bean, an bone, an iron man.—Selah.

And when that he found himself seized of an simoleon, he mocked and said, Wotto! Thou lookest lonely, little round one! Thous shalt go immediately to join the ranks of the great majority that lie in the pockets and safe-deposit vaults of the wealthy, even the rich. Thou are too little to save.

And behold he spent it hurriedly and gat nothing except perchance a third-class headache that was not negotiable.

And it was so that he learned from this no lesson, but did likewise with every sestertius that came into his paw, even into his mitt.

And when that he was old, he would teli thee, if peradventure thou wouldst listen, of what rotten luck he had always had.—Selah.

And behold there dwelt in this same land which is called Usa, yet another man who was constructed of different material and whose coco was upholstered differently inside.

And when that he gat an dollar into his claws he said, Verily as I live this is an doliar of the daddies! It is an whole doliar! I have worked for it, and behold turn about is fair play! When I am old and unable to work so hard, this bit of silver or paper will merely be getting its second wind, and it and all its children will be working for me like mad, not asking for a day off, for an old age pension or an eight-hour day. Get to work, fair plunklet, and toil for me, so that when I am so old I lie about how good I was in my youth, thou wilt keep me in smoking tobacco and daily papers and tripe.

And it was so that, as often as he gat an coin that he did not need for his necessary pleasure or food or raiment, he chucked it into the safety-bank, even the work-house of the dollar; and when that he was old and wabbly in the knees he sat at ease and spent most of his time trying to invent ways of staving off the pleas of the other man who was forever coming to him for an loan.

And behold when that the boob of the first part looked upon the well-painted dwelling of the wiseguy of the second part, he shook his knob and said: "Some people have all the luck!"—Fort Dearborn Magazine.

Quality, Not Price Should Determine Your Choice of a Piano

In these days careful buyers are asking, not "how much," but "how good." They have learned that there is no economy in "cheap" goods, and that merchandise of quality is the only kind which enables them to get lasting value for the money expended.

In no line of merchandise is quality more necessary than in Pianos. A cheaply constructed, poorly finished instrument of mediocre tone and uncertain standing, offers neither value nor satisfaction. Price is the only talking point for such instruments.

Good piano dealers will not carry these kind of instruments. It is true Pianos of dependable quality will cost a little more—but that extra cost is nothing compared to the years of use and complete satisfaction you will have in return. We carry a most comprehensive line of Pianos—many of them very old and famous makes, such as the Steinway—but they are all of dependable quality. The prices cover a wide range, and we gladly arrange convenient payment terms.

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

HOME DRESSMAKING

is either Drudgery or Pleasure—and the Sewing Machine the home dressmaker uses makes it so.

No matter how pleasing the patterns selected, or how beautiful the materials, it is Drudgery, and nothing else, to sew on an old awkward machine incapable of fine adjustments or good sewing. Such a machine takes the economy as well as the pleasure out of home-sewing. Besides it is a menace to good health and good dispositions.

Any woman so capable and clever as to make her own and her children's clothes deserves better than an out-of-date, hard running sewing machine to work with.

It is easily possible to get the full present worth of your old machine and forever rid yourself of its many shortcomings. Trade in your old machine on

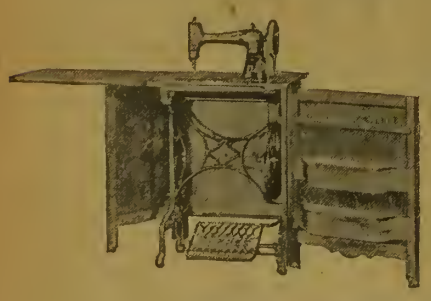
THE
"FREE"
SEWING MACHINE
Guaranteed For Life

and begin enjoying and profiting by the uses of this machine called rightfully, for its many perfections, "The Sewing machine of Today."

The "FREE" has these proven advantages:

It sews faster; it runs lighter;
It lasts longer because it has less vibration;
It makes an absolutely perfect stitch;
It is easier to operate; and lastly,
It is a beautiful piece of furniture.

Two Illustrations of the "FREE"



In the illustration above, the unique and satisfying features of the "FREE" cabinet are shown, with the case open and extended. On the left is the same machine closed when not in use. In the "FREE" all the old, time-worn defects of imperfect sewing machines have been eliminated.

Barker Bros. will accept your old machine in part payment on a "FREE" and will allow convenient payment terms on the balance.

If you want to know how to get full present value for your old machine, applied on the purchase of a "FREE"—and at the same time enjoy Barker Bros. convenient payment terms on the balance, write us fully, describing the make condition and age of your old machine, and we will tell you how you may easily and quickly begin to enjoy sewing on a "FREE."

arranging goods for the day—grocery benches piled high with delicious fruits—small boys outside sponging off the spotless windows. In the restaurants all the tables were occupied by early breakfasters, strangers to Hilga, but she had heard a month before that the city was filling with traders and visitors.

Hilga took a silver piece from her pocket and hailed a sleek coach boy whose white horses were trotting smartly toward the castle.

"Is this a public coach?" she asked. Then she stopped, for on one side was the coat of arms of the House of Id, and though the magnificent vehicle was painted a glittering black and looked like new, Hilga saw that it was the old, worn out carriage she had seen many a time when searching for eggs in the coach house.

The boy looked down and recognized her.

"Aha, Madame Hilga, so you are going back to your job today!" This isn't a public coach, but Sir Stan sends it around to pick up strangers and take them where they want to go when the city is very crowded. Let me help you in and we will be at the castle in five minutes."

Hilga shaded her eyes from the morning sun and gazed to either side as they passed. Never had there been a fairer city. All the churches had new moss green roofs and tidy grass plots bordered by geraniums. Happy faced children were beginning to troop along to the school near the castle which a few weeks before had been grey and neglected, but now was a handsome building as shiny as the leaves of the trees surrounding it.

The coach boy helped Hilga up the wide marble steps to the front door of the castle, and laughed all the way at her cries of "Goodness, gracious me! Who would have believed it!"

The emerald velvet terraces sloped smoothly to the road. The pillars of the castle had been painted a lustrous white, so that the place looked almost like a fairy palace. The branches of the birch trees were quivering gently and in all the sunny corners were flower beds or blossoming bushes. The great front door stood wide open, and helping Hilga inside, the coach boy waved his hand and left.

Hilga looked around. Surely this could not be the place. One pleasant room opened from the other and through them all the summer breeze blew, sweeping the soft net curtains lightly across the arms of chintz covered chairs or against tables and cabinets of glistening rosewood. Hilga had seen most of the furniture when it was scratched and dusty, so she could recognize that, but she would never have known the dining room. She stole on tiptoe down the corridor, beyond which was the end of a lace covered table. Behind the tapestry curtains she stopped, for two people were seated close together at one end of the board. The sun was shining on them and it was so very bright that Hilga turned her old eyes to other parts of the room.

Before a polished mirror a purple and orange parrot in a tall wicker cage flew about and chattered. The room seemed to be full of rosebuds, roses in the pattern of the rug, roses on the table, rose sprigs on the china and roses at the waist of the girl who sat in one of the two places. She was a tall, brown eyed girl and she was looking roguishly into the face of —Sir Stupe. But was it Sir Stupe? Hilga forgot to turn away—such a ruddy, happy looking fellow, as slim and stalwart as a pine tree.

"We have oatmeal and an omelet this morning, Stan," said Lady Dorance. "But dear old Hilga will be back by noon and then I promise you a real meal such as you used to have. Just to show that I am not going to boss, now we are married, you may even have it served on your ancestors dishes."

She laughed and Sir Stan bent to kiss the saucy mouth.

"Hilga is some cook," he said softly. "But she is going to have an easier time of it now—and as for dishes, I hope your rosebud china lasts forever; it holds just enough."

Hilga wiped the happy tears from her eyes and tiptoed back to the front door to knock, as an old lady should.

Seems as though in uplifting the poor and hammering at the rich a lot of us plain average people get overlooked.

THIS WEEK'S PATTERNS AND THE HOME DRESSMAKER

For this week's patterns we have purposely chosen simple designs for home wear—and home making. Last week we had a shock, and the waves from that shock are being passed on this week to Cultivator homes. This was what did it.

We visited a charming home, up-to-date, comfortable, prosperous looking except for the clothes of mother and children. Just at first we wondered a little, for we knew there was plenty of money in the family pocketbook and that both husband and wife held liberal views as to judicious spending for the family comfort.

Of course clothes are a big problem today—one of the biggest, but a second look showed the mother's and children's clothes of the cheap ready made variety that hadn't been able to withstand soap and water and sunshine and wear. There are ready mades and ready mades, some practical, substantial and really cheap, some not, and in these post-war days of various substitutions, the latter class is rather in the lead.

But to come to the point. There was a sewing machine in this house, but it wasn't used because it was out of order — and that was the whole cause of the shabby clothes. The machine hadn't been repaired or traded off for one that would run. The mother is a cheery, healthy woman who knows how to sew, likes to sew and realizes that her own and her children's clothes would be twice as good at half the cost if she made them herself, but she had simply dropped into the habit of buying the ready mades because the machine wouldn't work!

We all do it, of course, put off doing the simple easy things that would add immensely to our comfort and happiness when once done, and this was her particular put-off duty. And it was a duty, really, for we all know that while clothes do not absolutely "make the man" they come mighty near it, and when it comes to the women—well, you know.

Now each one of the patterns on this page is for simply made home clothes that any home dressmaker can make if she has health, time and a good sewing machine, and we hope, just hope, that this little hint may meet the eye of someone like our friend who has been depriving herself of the comfort of a good sewing machine that will work.—R. P. D.

USING DRIED FRUITS AND VEGETABLES

Even though they do not spoil, many dried vegetables which were delicious and attractive during the first weeks or months of storage deteriorate after long storage. Blanched vegetables deteriorate more slowly, and blanching in salted water (one and one-half solution) before drying constitutes a slight improvement. It is advisable to use the dried product first, reserving the canned until later.

Dried corn keeps in good condition for a long time, if good at the beginning. The peculiar flavor developed in dried green string beans is popular in many parts of the country. Dried soup mixtures deserve wide use, for the combination of such strong juiced vegetables as onions, carrots, cabbage, and turnips will retain considerable flavor for a long time, even though the individual vegetables which compose it may have deteriorated somewhat in flavor when compared with the freshly dried vegetable.

Preparing Dried Vegetables

Dried vegetables may be soaked from one to three hours in warm or cold water, and then cooked from ten to 30 minutes (or longer, if necessary). Or they may be put at once, without any soaking, into boiling water, and cooked slowly over the simmering flame for 20 to 40 minutes or longer if necessary.

The water added for soaking or cooking should be little more than the vegetables will take up. To soak them in a large amount of water which is thrown away, then cook them in a fresh supply of water which also is thrown away, is to take the most thorough method which could be devised for extracting and discarding most of their nutritive constituents as well as most of their flavor. Three cups of water to one cup of vegetable is as

The Cultivator Patterns

BE SURE TO SEND SIZE

3173. Boy's Suit. Cut in 4 sizes: 4, 6, 8 and 10 years. A 10 year size will require 2¾ yards of 44 inch material. Price 10 cents.

2974. A Good Work Apron. Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42 and Extra Large, 44-46 inches bust measure. Size 38 will require 5½ yards of 36 inch material. Price, 10 cents.

2789. Child's Set of Short Clothes. Cut in 5 sizes: 6 mos., 1, 2, 3 and 4 years. Size 2 will required for drawers, 1 yard, for petticoat 1⅞ yards, for dress 2¼ yards, of 36 inch material. Price, 10 cents.

3158. A Pretty Lounging Robe. Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. A medium size will require 5⅝ yards of 36 inch material. Price, 10 cents.

3182. Girl's Dress. Cut in 4 sizes: 6, 8, 10 and 12 years. An 8 year size would require 1⅞ yards of material 27 inches wide for the gulmpe, and 2½ yards for the skirt. Price, 10 cents.

3157. Misses' Dress. Cut in 3 sizes, 16, 18 and 20 years. Size 18 will require 4⅜ yards of 44 inch material. The width of skirt at its lower edge, is about 1¾ yards. Price, 10 cents.

3167. Child's Dress. Cut in 4 sizes, 4, 6, 8, and 10 years. Size 8 will require 3⅝ yards of 27 inch material. Price, 10 cents.

3162-3181. A Becoming Business Costume. Waist 3162 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3181 cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. The width of the skirt at lower edge is 1¾ yards. It will require 3⅛ yards of 40 inch material. The waist will require 3 yards of 36 inch material. Two separate patterns 10 cents for each pattern.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns. Address

Los Angeles

good a general rule as can be given, but spinach and greens take half of that, being light for their volume. Long cooking demands a larger amount of water, because it boils away; but vegetables should not be cooked longer than is absolutely necessary, except in the making of puree.

Particularly when the dried vegetables are put into boiling water without soaking, it is best to salt them towards the end of the cooking process rather than at the beginning.

One cup (measured dry) of most kinds of dried vegetables will serve two persons heartily, or three persons with moderate portions.

Dried vegetables may be used in the same way as fresh ones while they are still in prime condition. When they begin to fall off in flavor they should be judiciously combined with other materials and have flavoring materials added to them. Dried sweet potatoes or carrots which have become rather flat when served with butter and salt only are more appetizing when glazed. To do this, bake them (after cooking tender by boiling) with a sauce of sugar or molasses or syrup, and fat. Dried spinach which has become a little flat will be liked if it is served with an egg and vinegar dressing or in a cream sauce flavored with onion or celery.

Dried vegetables (after being boiled) may be served in gravy with the pot roast or meat or vegetable casserole or in the sauce for the baked or boiled fish. They may be combined with each other or with other fresh vegetables in "boiled dinner" or in chowders or casserole dishes of any kind. They may be used with rice, macaroni or bread crumbs, in stuffing baked peppers or tomatoes, or meat or fish; they may be combined in a mock mincemeat.

Cooking Dried Fruits

Dried fruits are usually given a long, slow cooking in water below the boiling point. They may be soaked for a few hours, or they may be simply washed and put directly into the warm water for cooking. The important point to be observed is not to soak or cook in too much water. The dried product cannot be expected to have as much flavor as the fresh, so all pains must be taken to dilute that flavor as little as possible. Most recipes for cooking dried prunes and apricots direct that two cups of water be used to one cup of fruit, but a better flavored product will result if equal measures of water and fruit be used when the cooking is done slowly in a tightly covered vessel so that little of the steam escapes.

Dried fruits may be sweetened lightly (since they usually contain a good deal of sugar themselves) with sugar or with any sort of syrup, according to taste. They are to be used as sauces, in puddings, fruit cakes and cookies, compotes, whips, souffles, and even salads, much as fresh fruits are used.

DON'T THROW AWAY OLD WINDOW SHADES

Many house furnishing stores will tell you that Holland shades are off the market. That is not quite true. but it is a fact that linen shades are scarce; many stores have no stocks of them at all, and when obtainable they are very high in price. This causes a housewife to hesitate about throwing away old shades that have become wrinkled, faded and thin, with the idea of replacing with new curtains. Generally the trouble with the old shales is that the filler has dropped out of the linen.

Window shades that have deteriorated in this way can be made to look almost as good as new at small cost and with little trouble. Go to a paint store and buy a can of ordinary flat wall paint. Reduce it by adding 25 per cent of turpentine.

Remove the curtains from the rollers; tack them down smoothly on a bare floor or table and apply one coat of the paint. To eliminate brush marks go over it immediately with a dry stiff bristled brush.

If it is desired to have the shades harmonize with the decoration or trim of the room, any color of flat paint may be obtained with which to accomplish it. It is possible to have the outside of the shade one color and the interior side different if it is preferred to have it that way.

By the adoption of this suggestion window shades can be kept looking bright and clean, at the same time saving the expense of new ones.

THE BRIDE'S LIBRARY

There are two books for which a bride finds much use her first year in double harness. One is the Bible, which she reads to teach her patience, and the other is the cook book, from which she learns to compound a satisfactory line of eatables, for 'tis all too true that the way to the heart, especially of a young man, leads through his stomach.

The Bible covers are not likely to become wet, except by an occasional tear, but the cook book is laid down in grease, molasses, butter, milk and water. The covers soon look like the baby's rag doll. Now a more or less bedraggled rag doll is all right, but anything used around the food is supposed to be clean and sanitary.

A bookbinding material of comparatively recent use is becoming very popular for cook books. It is a pyroxylin coated cotton fabric made to resemble leather. It is waterproof; can be washed over and over again without spoiling its neat appearance.

For a book bound in some other binding it is possible to make a slip on cover of the leather substitute. A quarter yard of it will be enough.

Politeness, like an air cushion, eases the jolt.

Wild Flower Time
In the Foothills

IS THERE anything more appealing to nature lovers than a Spring-time stroll among the wild flowers?

The gentle rains of the past few weeks and the balmy sunshine is coaxing nature to smile with her flowers most benignly.

Take a little journey over our lines to the upper San Fernando Valley, to the foothills and canyons above Glendale, Altadena, Sierra Madre, Monrovia, or Duarte. If you would go farther afield, go to Puente Largo and explore the San Gabriel River canyon and revel in the joy of a long Spring-time hike.

AJAX ROAD KING

JUDGE tires by results—by the mileage figures they pile up. It's the safe, sure way of measuring true value.

Judge the Ajax Road King on this basis and you'll know why so many farmers choose it over every other make.

"Shoulders of Strength"

The Road King is the Ajax fabric tire with triangular anti-skid tread design. The tread is braced and reinforced by Ajax "Shoulders of Strength"—an exclusive Ajax feature. They give the extra stamina which is particularly important to the man whose car must travel both good and bad roads.

The Road King wears well. It piles up splendid mileage figures. It's the companion of Ajax Cord, Ajax Tubes and Ajax H. Q. (High Quality) Tire Accessories.

Sold by good, reliable dealers who display the Ajax sign.

There's a saving all the way

Check up, step by step, every process in the production of poultry feeds and you'll soon see why you save all around when you buy a uniform, top-grade feed like SURELAY.

To begin with, mixing feeds is our special business. We have the equipment—we have the facilities—we have the experience! We buy our materials in carload lots—there's a saving there! Our operating costs per ton of feed are far below the mixing costs of the individual feeder—so there's a saving there.

And don't overlook *this* big fact: there's as great a saving in the ingredients we *leave out* of SURELAY as there is in the ingredients we put *into* it. For example:

We don't put *carbonate of lime* in SURELAY. Why? Because you can buy almost pure carbonate of lime at the quarry at very low figures and ship it at *half* the freight rate that applies to feed. We can't sell you lime when mixed in SURELAY as cheap as you yourself can buy it—so we leave it out.

And so it is with *moisture*. Water is cheaper in the watering trough than it is when mixed with feed—and that's why SURELAY contains as little water as possible.

Remember—everything that goes *into* SURELAY is needed. Anything that is not essential stays out. In this way there's a saving all the way.

Our booklet, "Makes Hens Happy," explains just why we can do this—shows how hundreds of successful poultrymen have found SURELAY the most economical, convenient, *uniform* feed they can use. This booklet is free—cut out and mail the coupon now!

STOCK AND POULTRY FOOD DEPARTMENT

SPERRY FLOUR CO.

STOCKTON • CALIFORNIA (A54)

How You Can Save on Carbonate of Lime

By GEORGE R. MCLEOD
Agricultural Department
Sperry Flour Co.

ONE of the commodities necessary for the poultryman to use in quantities is carbonate of lime. Many poultrymen believe it is best to purchase this in the form of oyster shells on the assumption that it is more effective in this than in any other form.

Oyster shells are not available in quantities large enough on this coast to take care of the demand, and this results in extremely high prices being asked for carbonate of lime in this form. In other words, carbonate of lime can be purchased in a grit form at a price of approximately $8 per ton, while the Eastern oyster shells cannot be bought for less than $20 per ton.

The proportion of carbonate of lime in some of the limestone deposits in California runs as high as 98% pure carbonate of lime, while the average amount of carbonate of lime in the various shells used for poultry feeds do not carry anywhere near as high a percentage.

Inasmuch as a large part of the feed used for laying hens consists of mashes and green feeds, a certain percentage (and possibly all of the grits used) should be lime grits.

Our feeds do not carry either oyster shells, flour or limestone grits, as we figure that the poultryman can save considerable money by buying the pure limestone grits instead of paying the cost of mixing this commodity in our mashes.

Limestone at the quarries can be purchased at a very low price in car-load lots, and takes the freight rate of crushed rock, which is less than one-half the rate on grain feeds. If it is included with grain feeds, however, it takes the same rate as the grain feeds, and on that account costs the consumer a much higher figure if purchased in this manner than if purchased in grit form.

What Will the 1920 Fruit Harvest Be?

Estimates and Some Comment Direct From California Orchards

WE asked last week for crop reports. Responses have been liberal and full of information as to conditions the state over. Of course, some of the fruit regarding which we have asked has hardly finished blooming and estimates as to percentages of crop may not yet be accurate, but ideas from shrewd observers who live with their trees will give a most valuable foundation for estimates by growers who are already asking: "What of the harvest and what of the market?"

The market outlook at this moment is exceptionally fine. The demand from Europe will be heavy providing Europe can secure the funds or the credit. If she cannot, Americans are earning in most liberal measure and are spending even more liberally. As usual Southern peaches are being "caught by the frost," and we are told the inroads from peach yellows have resulted in appalling loss. California must be in a position to meet this condition.

It is almost unthinkable that our output should be as large as last year. No year ever reached the 400,500 tons of last year. There may be sufficient new orchards in bearing to bring totals up to that output, but two such large productions in succeeding years is hardly probable. However, the optimistic reports which follow are most satisfactory.

Last year's output approximately was: Dried fruits; apples 10,000 tons, apricots 14,500, figs 11,000, peaches 35,000, pears 5,000, prunes 135,000, raisins 190,000. Almonds ran up close to 7,500 tons. Cherries, largely shipped fresh, totalled 335 carloads. Including these shipments and fruit canned the total production of cherries was close up to 13,000 tons.

For some reason the department af agriculture, bureau of crop estimates, in giving productions of various states quotes most fruit outputs in bushels. The bureau accredited California with a total output of 17,600,000 bushels of peaches, 4,500,000 bushels of pears, apricots (expressed in tons, however), 165,000.

Note in Mr. Kaufman's report frost occurred during the month, severely damaging almonds in some localities. There are some apricot sections from which same report has been received. Also in some sections, "serious damage from brown rot." Some prune and pear sections report: "Thrips are prevalent." Hemet growers seem most discouraged amongst apricot people; there it is feared the crop may be little more than a third that of last year.

One serious feature which growers are considering may lower the output is the rainfall. In most fruit growing sections it has been insufficient "to go down and meet the upcoming water." Where possible, however, winter irrigation has made good this deficiency. As early and as heavy irrigation as possible should be given in practically all sections.

The reports are from the orchards, usually, though the first is from an expert of the federal department of agriculture.

E. E. Kaufman, U. S. D. A. Bureau of Crop Estimates

The only crop news I can give you for publication is contained in the following report. Now looks like conditions on most deciduous would be more or less spotted as both drouth and frost have touched up things a trifle in different localities.

Frosts occurred during the month, severely damaging early almonds in some localities. Some early apricots and cherries also suffered slight damage where bossoming was early and unprotected. Detailed reports concerning fruit crops are not made at this time, but the conditions for the various deciduous fruits seem to appear quite favorable. Counties around San Francisco report some damage to apricots from brown rot. Thrips are (Continued on Page 692.)

Overland

TRADE MARK REG.

The Way Bumps Look The Way Bumps Ride

Wonderful Riding Qualities In Coast-to-Coast Trip

ON rough highways and desert trails, in sunshine and storm, the Overland 4 Four-Door Sedan blazed the trail for the U. S. Army Pioneer Motor Transport Train from Washington to San Francisco. This plucky car was ever in the lead.

It was still another convincing demonstration of the wonderful riding ease of three-point suspension *Triplex* Springs and of this car's remarkable abilily to hold the pace on any road.

Dr. Johnson, official lecturer for the Lincoln Highway Association, rode the entire distance from coast to coast in the Overland 4 Sedan. He pays this splendid tribute to its performance:

"I found the Overland 4 Sedan so suited to my needs that I rode in it from choice all the way. It must be the new spring arrangement, for even when the roads were rough I came to the night stops without fatigue. It is a marvel of ease and comfort."

The Nematode Menace

By Ernest Braunton

NO MORE serious trouble menaces the farmer in many sections of the state and country than nematodes, particularly that section of the family known as root knot nematodes. So serious are the invasions of these tiny worms that Horticultural Commissioner Ryan of Los Angeles County secured D. G. Milbrath, assistant pathologist, United States department of agriculture, now located at Alhambra, to deliver a lecture on the subject to the county inspectors, on April 14. Mr. Milbrath once made a survey for the government of all infested territory from the Atlantic to the Pacific and is therefore peculiarly well qualified to speak authoritatively on the subject. The main points and statements in his speech are herewith given.

What is a nematode? It is a worm belonging to the group known as round worms. To this group also belongs the trachina, the worm infesting pork and transmitted thereby to human beings. Other closely allied species are the parasitic intestinal worms common to sheep, horses and some other animals, and occasionally to mankind. The now notorious hookworm is also a nematode. The common root knot nematode is not so minute that a microscope is needed to see it, for the female, especially, is easily seen by the unassisted eye.

General Distribution

Nematodes do not exist in the colder states as yet for extremes of any kind, especially cold, are strong deterrents to introduction and increase, yet they are found in Denmark and nearly all parts of Europe. In this country the vicinity of Norfolk, Virginia, is the most northerly infested district and nematodes are very bad there. In North and South Carolina and that section generally the watermelon and okra are most affected. In Florida and Georgia they are very bad, the former state being "one giant nematode" in both shape and condition (the female is bottle-shaped). Even peanuts are badly infested in the Southern states.

From there the affected area ranges west through Louisiana, etc., to Texas, and in the latter state is serious on alfalfa, some varieties of soy beans, cow peas and crops in general. In Arizona nematodes are chiefly confined to truck crops in the Salt River Valley. In California, Oregon, Washington, Idaho, Nevada, Utah and Colorado their range is considerable. From New York west to Colorado there are none and there is no reason to expect plants from this area to be held up in transit because of nematode infestation.

In California

Just at this point, as a defensive measure, we will side-track some of the official specific statements of the speaker. He gave names of points visited and in some cases names of growers with infested fields. But the districts affected were not outlined except very generally. Suffice to say, parts of all counties are infested and any spot in the state may suffer a visitation at any time.

In Imperial County one field was found where 60 per cent of young cantaloupe plants were killed. In another section, after land had grown alfalfa for six years, the first year following, planted to cantaloupes, the loss in plants was great. In Riverside County tomatoes and truck crops in one district were heavily infested. To San Bernardino County was traced with some certainty the original alfalfa infestation, carried by flood waters through to the Pacific Ocean. Orange County is hard hit on lima beans, sugar beets and other crops. In Los Angeles County the range is wide and varied, from the potato and celery fields to carnation gardens. On the latter plants a strange condition was noted; the red carnations were little infested or aflected, while the whites and delicate colors were seriously injured.

A quart of soil from a Ventura County field was sent to Washington for examination and study. Girls were detailed to count the live nematodes found therein, eggs and dormant females not included. It was estimated from this count that at least 300,000,000 existed in one acre of soil and there were eight species found in the one quart, some of which are doubtless beneficial rather than harmful to the farmer. Tulare, Fresno, San Joaquin, Sacramento and counties to the north, in sections, have serious trouble on vegetables, peach, fig trees and a wide range of host plants.

Classes of Nematodes

Soil nematodes are divided into three classes: Useful (?), disease producing and root knot species and varieties. Stomachs examined proved that some species live on animal food and these are believed to be, in part at least, beneficial to agriculture. Then comes the disease producing group, of which there are seven species, one of which at least is common from the Atlantic to the Pacific.

One species gets into the grain of wheat and produces what looks like a smut but the black stuff is fibrous instead of powdery. The species found on the strawberry and the alfalfa is one and the same. One species infests citrous plants; another, sugar cane and bananas, and still another, cotton and potatoes. The root knot nematodes are bad worms for they have spears for piercing the tissue of plants, not unlike the tongues of snakes.

Life History

The larva penetrates and enters the root, feeding thereon, but causing little damage through food supply taken. But the rupture and damage of tissue is heavy and the subsequent swellings and growths of the infested parts may be likened to tumors in human beings. The male worm dies soon after he functions as such, but the female lives and produces 240 to 340 eggs, occasionally giving birth to young alive, as in the case of aphids. In one knot the size of his thumb the speaker counted 75 females.

Larvae, when hatched, sometimes leave the soil and go into new or uninfested roots. Therefore, soil may be infested with transient worms seeking agreeable host plants. Soil clinging to celery roots was found heavily infested. The size of the root knots is dependent upon the number of nematodes. Those on alfalfa do not seem to harm the plant, merely feeding thereon, but are a menace to other plants. It is not hard for a trained eye to distinguish nematode knots from nitrogen nodules. Nematodes as a rule are inside the root and cause swellings, while nitrogen nodules merely hang on the outside without enlarging the root. On the sugar beet the worm does not enter the plant, she merely works her head in and hangs outside, appearing like a pearly grain of sand, for which she is often mistaken.

The citrous root nematode likewise hangs on the outside, but is a light brownish color. The sugar beet female soon becomes encysted and the sac becomes brown and leather-like and full of eggs, though young may also be born alive. Distribution is largely effected by flood waters and by soils knocked from roots in handling. Wagons used for hauling potatoes, beets, etc., will distribute this soil, by leakage, all along the roadways. One of the most potent factors in distribution is the potato crop.

Control is difficult, though some varieties of soy beans and cow peas are nearly immune or resistant. Extremes of all kinds are deterrents to multiplication as in case of all animal life. Flooding land for four to six weeks has rendered it comparatively free. Summer plowing in hot sections and periodic stirring of the soil aid much (also burn up the humus). But the main reliance in control is starvation through crop rotation, the planting of crops your present species will not feed upon. Sugar beet growers should alternate with soy beans, alfalfa and cereals. Cotton growers in the South plant cow peas or velvet beans, then corn and the third year come back to cotton. In cereals beet growers should use wheat or barley and avoid oats as the latter carries nematodes. Their life history is complete in 24 to 28 days so that any means of destruction continuously followed will soon reduce numbers, but to get them all requires much persistent warfare. They generally inhabit only the top foot of soil, but have been found in light soils at three feet. Root knot nematodes constitute a serious menace to California agriculture and every possible means of control should be practiced in infested districts and every reasonable effort made to keep free districts forever free.

Bean Growers Must Cooperate

A MEMBERSHIP campaign has been conducted by the California Bean Growers Association through the various bean sections, Santa Maria, Lompoc, Solvang, Turlock, Modesto, Stockton, Courtland, Knights Landing, Socramento, Yuba City and Sutter City.

President Mendenhall and others of the officers explained the work already done by the association and the problems now being taken up. From his talks we give the following:

"You are all more or less familiar with the history of cooperative growers' organizations, their purposes and results obtained. We should bear in mind this lesson, that most of them have failed in their initial attempts, usually by being founded on principles which were not truly cooperative, or because of apathy or suspicion on the part of the growers, or by insidious propaganda of the middleman or competitive packers and so on.

Weathered Worst Difficulties

"Our association is only in its second year, and has weathered the worst of difficulties; it is not perfect as yet but is operating more and more efficiently as we get from under the enormous overproduction of 1918, and dispose of the great volume of inferior beans. You must all realize that the association has not had a real opportunity, is not old enough, to really demonstrate its effectiveness.

"The association is making a good fight to get a tariff on foreign beans and prevent the annihilation of the business. We touch on this question again and I hope you will all realize what a menace the Oriental bean is. The greatest and most important purpose of the association, however, is to economically market and distribute the bean crop. In doing this we are trying to solve a problem which today has the attention of federal and state governments and of thousands of housewives. Every candidate for office in this political year includes in his platform what he is going to do to solve this problem. I mean, how are we going to cut down the cost to the consumer and yet give a fair deal to labor and a fair deal to the producer?

"Now marketing and distribution are not generally understood. It is not so difficult to ascertain what the cost of production is and not difficult at all to know what the consumer pays. But what happens in between, is the elusive question. Usually the dealer buys from the producer as cheaply as his commercial instinct and ingenuity and the needs and lack of information on the part of the average farmer will permit. Sometimes the produce goes through a broker to the dealer. Then comes a long line of go-betweens who deal and speculate and add costs to cover duplicated overhead expenses.

(Continued on Page 697.)

Agricultural News Notes of the Pacific Coast

Northern California

Range cattle are now having finest pasture of the season.

Garlic is reported retailing in Sacramento at 85 cents a pound.

The Chico high school will give a tractor course beginning May 10.

There are 10,000 acres of peas planted in the Sacramento Valley.

The Glenn County farm bureau has concluded purchase of a saw mill and planing mill near Oriand.

Plans for the formation of a Livermore Valley water district are meeting with general approval.

Grape growers of the Livermore Valley are interested in the project to establish a dehydrating plant at Livermore.

Movement is under way calling for great increase in the number of sheep on the small ranches of the Sacramento Valley.

Grape growers of Alameda County met at Livermore April 10 to discuss affiliating with the California Grape Growers Exchange.

Sacramento Valley canners are now handling great quantities of spinach. It is estimated the output will be 25 per cent greater than last year.

At last week's meeting of the Cloverdale farm center there was general discussion of the state farm bureau federation plan for improving livestock.

The Stockmen's Protective Association will hold its annual meeting and banquet the first Saturday and Sunday in May at Livermore, Alameda County.

Recent rains were reported to have done no damage to cherry blossoms in the Santa Clara Valley as the wind immediately following the rain drove away the moisture.

California Wool Growers Association is forming a pool of wool growers which will control at least $2,000,000 worth of wool to be sold during the coming season.

Capitalists of Australia are establishing large works for the manufacture of jam at Oakland. A high grade of superlative quality of jams is to be put out by this factory.

The first public meeting in the campaign to organize a water district in the Livermore Valley was held at Livermore, April 12. Petitions had been in circulation for a week or two previous to the meeting.

The farm bureau of Placer County has included in its program of work for 1920 a dozen important subjects; among them irrigation, roads, telephones, consolidated schools, septic tanks, farm business records, wool pool.

It is proposed to raise $450,000 amongst California good roads boosters to aid in constructing a better road between Reno, Nevada, and Utah. This seems to be necessary because the road traverses a section entirely unable to bear the expense.

Several cars of grapes which were shipped last season to the Welch Grape Juice Company arrived in poor condition so it is not known whether the large Eastern grape juice manufacturers will take kindly to California grapes for unfermented juice purposes.

Central California

The recent cold rains have retarded melon crops in Stanislaus County.

The railroad strike stopped orange picking in the Lindsay district, Tulare County.

California Rice Growers Association is protesting against an advance in rates.

Stanislaus County reports sweet potato acreage materially reduced over that of last year.

California Holstein breeders are to meet in Tulare May 5 for conference and for large public sale.

Permit to operate has been granted the Dinuba Dehydrator Company. The company expects to handle mostly grapes.

The California Olive Association has decided to start an advertising campaign to restore consumers' confidence in ripe olives.

The cannery of the California Cooperative Canneries located at Modesto expects to handle 400 tons of fresh figs this year.

It is rumored that a new association of berry growers will be formed to compete with the Berry Growers Association of Central California.

Notwithstanding fig prices have made a disastrous decline buyers are manifesting considerable interest in securing promises for delivery of next season's crop.

Fresno County Beekeepers are moving their colonies into Tulare County orange groves. The bee inspector of Fresno County predicts a large flow of honey this season.

The committee of the fig growers association which has been investigating as to the disposal of the coming crop may recommend affiliation with the Cooperative Cannery.

The Oakdale, Stanislaus County, irrigation district reports its total expense for last year as amounting to $269,476. Interest on bonds is the principal feature of the cost.

The Stanislaus County Fig Growers Association has voted to affiliate with the Modesto unit of the California Cooperative Canneries. A considerable tonnage of fresh figs has already been signed up.

The hog auction of the California Farm Bureau Marketing Association announced for April 13 at Tulare was postponed because of uncertainty of securing shipping facilities. Three hundred hogs were listed for the sale.

The California Peach Growers, Inc., is distributing two and one-half millions to apply on 1919 crop. This makes a total of over $10,000,000 paid to the growers. The fruit delivered is averaging close to 14½ cents per pound.

The grape growers of the Lodi district held a meeting April 17 under the auspices of the organization committee of the California Grape Growers Exchange in line with the campaign to form a cooperative marketing association of wine and table grape growers of the state.

The case of the Raisin Gorwers Association before the trade commission under charge of being a trust is thought to be favorably affected by the recent decision of the Supreme Court in the case of the steel corporation. Attorney Sutherland is handling the case for the association.

Southern California

A light rain last week helped grass and grain crops.

Missourians are called together for state picnic at Long Beach May 8.

Twenty-one orange packing houses were closed in Riverside because of strike.

Fruit growers of Victor Valley are to convene at Victorville Saturday of this week.

Victor Valley is testing out cotton and also making large plantings of sorghums.

Riverside planters have tested tobacco and find it possible to grow two crops a year.

A new center of the Riverside farm bureau has been formed exclusively of citrus growers.

Westmoreland, Imperial County, is coming to the front as a great producer of cantaloupes.

Los Angeles County farm bureau recently held a lemon pruning demonstration at San Fernando.

Orange County's apricot output will be greatly reduced because of uprooting many of the orchards.

Native Sons of the Golden West are advancing the movement to prevent Japanese ownership of land.

Imperial Valley is planning the erection of a permanent wier across the Colorado below the Mexican line.

"The greatest crop of cantaloupes ever produced in Imperial County." It will also probably be the earliest crop on record.

Riverside and Orange County irrigators are inspecting dams on the Santa Ana River in the San Bernardino Mountains.

Serious losses have been caused citrus growers because of the railroads refusing to accept perishables during the railway men's strike.

The Automobile Club of Southern California is extending its work in posting directions along desert roadways and in marking water holes.

Imperial Valley cotton growers have been cooperating in securing pure and pest free seed, working with the state department of agriculture and the U. S. department.

Riverside County farm bureau members met at Fairmount Park and listened to the report of the farm advisers trip through the Sacramento Valley. J. E. Wherrell has been re-elected president of the Riverside County farm bureau.

The first six months of the present cow testing year in San Diego County shows some remarkably fine producing dairy cows. Three of the cows produced over 300 pounds butter and an even dozen others exceeded 250 pounds during the test period.

Imperial Valley cantaloupe growers are fearing car shortage but making every effort to have in hand at least 11,000 cars to transport this season's crop. The planting this year exceeds 20,000 acres. Shipping will probably begin within a week or ten days.

Los Angeles chamber of commerce is planning for a great industrial week, May 17-22. The city boasts of more than 60 per cent increase in industrial plants in the past year. Canneries and other food manufacture plants are no small factor in the city's activities.

The Coast and General

The end of March saw severe frosts in Southern Arizona.

The Arizona Gypsum Company is erecting a plant near Phoenix.

The Mexican Women's Home Bureau of Arizona has started an anti-housefly campaign.

Morrow County, Oregon, has decided on September 13 to 18 as dates for its county fair.

Walla Walla County, Washington, is establishing a pure bred Holstein herd on its county farm.

The Federal Reserve Bank at Dallas, Texas, reports about 15 per cent increase in cotton acreage.

Twenty farmers of Grass Valley, Oregon, have formed a farm record and bookkeeping association.

Under appropriation for forest roads California has been allotted a total of $1,900,000 from the federal fund.

Whatcom County, Washington, reports 5,600 head of cattle tested in 1919 with 1.63 per cent reactors.

The farm bureau of Island County, Washington, is planning to build a brick and tile factory at Oak Harbor.

Three Japanese companies have acquired 15,000 acres of land below the boundary between California and Mexico.

A statement sent out by the Spokane Fruit Co. to all members urges every possible conservation of moisture supply.

Thirty head of cattle brought an average of $449 at the annual Shorthorn Breeders Sale held recently at Klamath Falls, Oregon.

A grain grading and seed standardizing campaign will be held in Umatilla County this summer by the Oregon agricultural college.

State Veterinary Inspector Swingley of Washington reports examination of 61 cows at Harrington for tuberculosis, not one of which reacted.

According to recommendation of the special committee appointed by the mayor of Portland, Oregon, the retail price of milk will be reduced to 13 cents a quart.

The horticultural department of the college of agriculture assisted ranchers and development companies in Pinal County in drawing up landscape plans for tree and shrub planting.

Farm bureaus of Oregon are protesting against a statement issued by the Merchants Association of Salem in annual convention, that the high cost of living was due to farmers organizations.

Indians on the Klamath Reservation are asking for a government loan of $2,000,000 to be used in development of agriculture and stock raising, the loan to be repaid from sales of Indian timber.

The hurricane which covered much of the Middle West recently caused great damage to farm buildings and equipment. In addition truck crops of many southern sections were swept away or seriously injured by the wind.

The Okanogan County, Washington, Livestock Association held a two days session at Okanogan the first week in April, electing E. F. Banker president and P. T. Harris secretary-treasurer. Plans were also made for the holding of a livestock show at Okanogan in the fall.

Canners Meet With California Nurserymen

By M. C. Holman

WITH the object of arriving at a better understanding of the needs of canners in the matter of the proper sorts of fruit to produco, the California Nurserymen's Bud Selection Association called the representative canners of the state to meet with them at San Francisco on Friday, April 16.

In his opening remarks J. E. Bergtholdt of Newcastle expressed the desire of the association to promote the production of better trees with better fruit and the elimination of such trees as do not produce fruit that has a profitable market value. Promiscuous planting, which has been freely indulged in for many years, is one of the fatal errors of the orchardist, and it is with the object of standardizing production for the nurseryman, the canner, and particularly the grower, that the meeting was called. It is a self evident fact that what is good for the canner's needs is the fruit to raise and what the canner does not want and cannot profitably use may be profitably eliminated.

The aim of the Bud Selection Association, as expressed by L. B. Scott, the manager, is to furnish to the different nursery members buds of all the fruit varieties propagated by them. These buds will be taken from bearing trees and in all cases will be selected from trees which are high producers and typical of the desired variety. The association is operated as a non-profit organization, buds being furnished to members at cost. Buds will also be sold to any reputable orchardist who desires to purchase them for top working orchard trees. The association operates in two distinct phases as a public service—first, in furnishing the best possible type of bud wood to the nursery members, and, second, in providing a channel through which orchardists can purchase selected buds for top working.

The association has already received the hearty support of the state and federal governments and a fund has been placed at the disposal of the federal agricultural department to be used in bud selection investigation with deciduous fruits in California. This bud selection association hopes to accomplish for the other fruit interests of California just what the California Fruit Growers Exchange, through its bud supply division, has accomplished for the citrus industry. The object will be to concentrate upon the leading varieties of each fruit or such varieties as are desired by the canners and the shippers.

Heretofore the catalogues of the nurserymen have contained dozens of varieties of the different frults and, while all of them have relative values, it is bewildering to the average planter to make the proper selection and be sure that he is getting a variety that will be in demand by the packer and canner. Whilo it is true that soil and climatic condltions change the variety of fruit, and the same fruit may change in character in different localities, it will have similar characteristics and be in similar demand in all localities, unless the changes are so marked as to make an abnormal product.

In endeavoring to determine the percentage value of all varieties of fruit a list was presented to each canner with a request that he note his estimate of the demand value of the different varieties and eliminate such as did not seem to him to be worth while planting, same having no apreciable canning qualifications. These percentages, it may be explained, represent the value of the varieties to the canners. They are not to be taken as the planting percentages, but they are the percentages upon which the canners desire the fruit. It is a relatively general viewpoint of approximate purchasable value. There was, of course, a slight difference of opinion as to the merits of the various varieties, depending upon the locatlon of the cannery and its known choice, but the percentages following are a safe medium between the extreme and mean valuation and may be used as a basis of reckoning in the purchase of trees for planting:

In the list of clingstone peaches the Hauss and Johnson were eliminated as they were considered identical with the Pelora, which is a firmer peach and a much better shipper. The white varieties, McKevitt and White Heath, were eliminated as the canners do not find it profitable to can the white clings, owing to the tendency of the peach to turn brown, giving it an overripe and displeasing appearance. The round Tuscan received a 25 per cent vote, the Pelora 10 per cent, Peak's 10 per cent, Libbes 10 per cent, Phillips 40 per cent, Albright five per cent, Levy five per cent and McDevitt five per cent. While the Pelora was given only a ten per cent rating, attention was called to the fact that it is a rather new peach and the life of the tree is hardly known. It has been a heavy bearer wherever planted and promises to become one of the standard canning varieties. Peak's is almost identical with the Pelora and might be favored more strongly if it were not for the short stem which it sometimes shows. It is generally a prolific bearer and possesses many desirable canning qualities.

The Sims received a ten per cent vote. It has generally given good satisfaction and comes into bearing a week earlier than the Phillips, which ranked at 40 per cent. This peach was given the highest canning rating on account of its firmness. It does not "rag out" in the can but holds its texture and form to splendid advantage throughout the entire process of canning. The Levy or Henrietta was allowed only a five per cent rating as it does not do well in all sections. The Orange peach was eliminated entirely on account of its similarlty to the Albright, which received a five per cent rating and is considered a fair midsummer variety. The McDevitt was also given a five per cent rating. It is a fair variety and comes in later than the Albright.

In the selection of freestone peaches the Lovell received the overwhelming vote of 70 per cent and the canners expressed a desire to purchase all that were offered of this variety. Following the Lovell were the Muir, the Elberta and the Salway, which received ten per cent each. The J. H. Hale was eliminated. The Fosters and Crawfords are not purchased for canning and were eliminated. They are shipping peaches and will be retained on that account.

As to the desirability of the cling and freestone peaches for canning purposes the vote stood 85 per cent for the clings and 15 per cent for the freestones. It would appear from this statement that the freestones might profitably be eliminated when raising peaches for the canning market, but the general market may still demand a goodly portion of freestones, and the consumer, whether from the can or the basket, is always to be a determining factor in planting trees.

In apricots the Blenheim stood 70 per cent, the Royal ten to 15 per cent and the Tilton 15 to 20 per cent. It was contended by George C. Roeding that the Blenheim and the Royal were identical, while Mr. Bergtholdt declared that, although they were simllar, there was a slight distinction. The Moorpark, Routier's Peach, Hemskirk and the Large Early Montgamet were recommended to be taken out of coming catalogues.

Apricots most suited to certain sections may not be suited to other sections. Along the Coast the recommendation was that the Blenheim be planted exclusively, while in the San Joaquin Valley the Tilton was urged exclusively. In the Sacramento Valley there was a 50-50 recommendation on the Blenheim and the Tilton.

In cherries the Royal Ann received a 60 per cent vote, assorted black varieties 20 per cent, Rockford ten per cent and Governor Wood ten per cent. The shipping varieties were strongly recommended for planting as there is a decided demand for California cherries in the East, where fabulous prices are often realized, especially for the early shipments. This season $50 was paid for the first box of cherries shipped out of the northern part of the state, this going from the Vacaville district.

The Bartlett pear received the entire recommendation to the elimination of all other varieties.

There was only meager consideration given to plums and the recommendation was that only one-twentieth as many plums be planted as cling peaches. Of the three varieties the Washington received a 25 per cent vote, the Jefferson 25 per cent and the Yellow Egg 40 per cent.

Nectarines are not canned and no consideration was given them.

Sour cherries were given favorable consideration. They have some features which should recommend them to the attention of the planter. They are used by confectioners and canners and are generally heavy bearers. In Michigan large plantings have been made with marked success and it was thought that California should be made a larger producer than at present, where only a few orchards may be found. The Montmorency was recommended as the most suitable variety

The next meeting of the Bud Selection Association will be with the prune and apricot growers on Saturday, April 24, at the office of the Prune and Apricot Growers Association in San Jose.

Cattlemen in Convention

By C. B. Messenger

"BIGGEST and best convention yet held" was O. B. Fuller's characterization of the semi-annual convention of the California Cattlemen's Association held in Los Angeles last week. Zone Five cattlemen entertained royally; every member from the northern end of the state spoke highly of the hospitality and the good time which was given to the visiting members. There were members in attendance from nearly every county from Tehama to San Diego.

Fred H. Bixby called the convention to order and made his opening address or, rather, as he expressed it, simply talked a few facts. He seemed abundantly able to handle the situation from then on, but asked T. H. Ramsay of Tehama County to act as presiding officer.

President Bixby appealed to the members to learn the rules of the game and play the game absolutely on the square. For the sake of more effective work in each section of the state, it is divided into 25 districts or zones. The membership represents a half million cattle. Its work is sustained through a membership fee of three cents for each head. The two strongest appeals made during the convention were for more complete cooperation and for improving the grade of stock. Produce fewer cattle; produce better cattle. Do this by buying not only pure bred bulls, but pure bred bulls of the best strain and the highest type of individuality. "This association is not planning to run your business, and it is not planning to fix prices, but it is planning through cooperative effort to secure fairer treatment in the markets, to watch and aid where necessary in legislation, to unite with the department of the interior to secure greater service through the forest reserves, to prevent cattle stealing, and generally to keep the cattlemen from getting it in the neck. The position now held by the association in the eyes of cattlemen in the state is shown by the fact that since the first of January there has been added to the membership roll 367 new members representing 70,000 head of cattle. The president insisted that the membership is still too small and the association will not be content until 85 per cent are uniting with their fellows and making it one of the strongest associations in the state.

The association took an unqualified stand against the installation of union stockyards in Los Angeles. The matter came before the convention in report made by a committee appointed

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THE FRUIT CROP

The Cultivator hopes the service it is rendering in printing the fruit crop estimates from various parts of the state will prove of real value to fruit growers. It is but keeping up the custom of years, and while cooperation is being used to a greater extent today than ever before, and that cooperation enables gathering of best of data by qualified crop estimators, yet we know there will be many a fruit grower aided by this preliminary view of fruit crops over the state.

WHY THE SLUMP?

Liberty bonds are now selling anywhere from 85 to 96 cents according to issue. We are all astonished, and we are all asking why our bonds, "as good as gold," are going at such figures. Perhaps they are still "as good as gold" for silver has passed gold and certainly commodities passed it long ago.

Here is a hint for Cultivator readers: There is good money in buying Liberty and Victory bonds at present quotations. Perhaps there is no occasion for doing what we did during the war—borrowing money at long interest to loan at low interest, but there is opportunity, and we are not certain but there is occasion for the manifestation of a bit of patriotism in taking—or keeping—these bonds off a depreciated market. Liberty bonds are magnificent security and where one is in need of funds, better borrow than sell at today's prices.

GARDEN SASS

Back East they are remarking, "The frost is out of the ground and gardeners are limbering up." "Out West" we have limbered up and already harvested our first crop of garden freshness for our table; second planting is now being made, and excepting in sections where desert heat may come later, fine results may be had by planting at this time or even much later. In many sections every month in the year sees fresh seed put in the garden. It calls for a bit of endeavor, but it is worth the money. Make it a thrift garden and save enough for another Liberty bond.

Modesto, Cal., April 12, 1920.

Editor California Cultivator:

After reading the article "Conclusions of an Ignorant Cowman," which was published in the Cultivator of April 3, we though it so good we passed it on. C. W. Blabon, state organizer for the Farmers' Educational Cooperative Union, read the article at a big meeting of Sylvan Farmers Union No. 158, held in the Prescott Community Hall, near Modesto on April 5. It received favorable comment from the crowd present which taxed the seating capacity of the hall. It appears, even to a "country clod hopper," that Mr. A. L. Spellmeyer has assembled some very sane and sensible conclusions. We would like to have other articles from him. The Cultivator is to be commended for its liberal viewpoint and its standard of justice since it presents the farmer's condition just as it is. The farmers and livestock men, the agricultural people, must stand shoulder to shoulder, and the ballot is their greatest weapon. We have often marvelled at the unconcern of farmers and farmer's wives! Working 16 hours a day, morning and night, their head in a cow's flank, no home conveniences, no bath tub, no sink, no time to read the paper—and their idea of a vacation is a sleep on a Sunday afternoon!

But that picture is changing, thank God, and we find Mr. Farmer and Mrs Farmer joining some farm organization, getting their "thinkers" oiled and adjusted and talking about conditions and economic questions. The farmer will soon be looking out for Number One.

Respectfully,
MRS. C. E. WHITMORE,
Secy-Treas. Sylvan Local, F. E. & C. U.

The University of Arizona, Tucson, The College of Agriculture,
April 15, 1920.

Mr. C. B. Messenger, Editor,
California Cultivator:

I have just finished reading with great satisfaction your article discussing the recent convention of the League of the Southwest. Having listened to practically all of the addresses at the convention I had opportunity to know what was said and to value the opportunity of attending a very exceptional gathering of strong and forward-looking men. With this background I wish to compliment you on the excellence of your review of the meeting. I am sure that what you have written and published will impress your people more strongly than they could be impressed in almost any other way. You have given a real picture of the convention.

Very truly yours,
D. W. WORKING,
Dean and Director.

SOME ARE—SOME NOT

A San Diego subscriber asks: "Are the seven million farmers for or against Hoover for president?"

This is not a proper question for our questions and answers department, for if an answer were attempted it might take a political turn. The farmers are not worrying about political questions, for this is the busy season. We hope, however, that they are keeping in touch with political events and realizing that our nation calls for the patriotic service which can only be given through fullest information as to our political candidates.

DON'T PUBLISH NAME

No week passes but the Cultivator receives letters making inquiry or giving a word of information for Cultivator readers, the letters ending with something akin to this: "Please do not publish my name for I cannot take the time to answer the letters which come." And occasionally the writer adds that many requests for mail information come without expression of appreciation or even a postage stamp. A postage stamp is a small thing to the inquirer, but stamp after stamp becomes a large matter to the one inquired of, this in addition to expenditure of time, energy and stationery.

Where a question is to be answered in the questions and answers columns of the Cultivator all that is necessary is the postcard or simple letter request and paid contributors or the editorial staff will answer without charge. It is one of the rights of our subscribers. But don't forget the stamp if occasion arises to make mail request of contributors.

IF THE PACIFIC WERE GAS

Once upon a time it was considered a fairly safe proposition that everything that goes up must come down. That doesn't apply, however, to all the gasoline which is being pumped from the center of the earth. It's never going back again. Hence those of us who are so fortunate, or the reverse, as to own a chug wagon, are asking "What are we going to do about it?" To give an idea of the rapidity with which we are burning up our money, a statement issued by the Farmers and Merchants National Bank of Los Angeles says:

"It is stated that the people of Los Angeles County are spending approximately five million dollars a month for gasoline for their motor cars. That means 60 million dollars per annum. At 20 cents a gallon, that amount of money represents 300 million gallons of gasoline used in Los Angeles County alone in one year. The entire state on that basis would probably use a billion gallons per year. The balance of the United States is prodigal in proportion with the machines in use. New machines, trucks and tractors are being put out by the hundreds of thousands, all of which tend to increase rather than diminish the consumption of gasoline. Where the enormous amount of this product now demanded is to be obtained for any long period of time is a most serious problem. To obtain it crude oil production must be largely increased. At present the production of crude is diminishing.

If the Pacific ocean were gasoline instead of salt water the consumption thereof in California alone would annually make quite a dent in it."

The worst of it is the most of us are not seriously affected by such presentation of facts.

GROW WOOD

Back in freeze-up country they estimate that it requires about ten full cords of wood to keep a small sized family reasonably comfortable through the winter. California families don't require that much; too many of them think we don't require any stove wood for heating purposes. A cheery fire in the fireplace adds much both to the real and imaginary comfort. But cord wood as furnished in the markets adds fearfully to the high cost of living. Where neighbors can agree on property line planting a few trees make a woodlot which may not only prove valuable as a windbreak but as a source of fuel.

Grow more trees.

GREAT CAPITAL

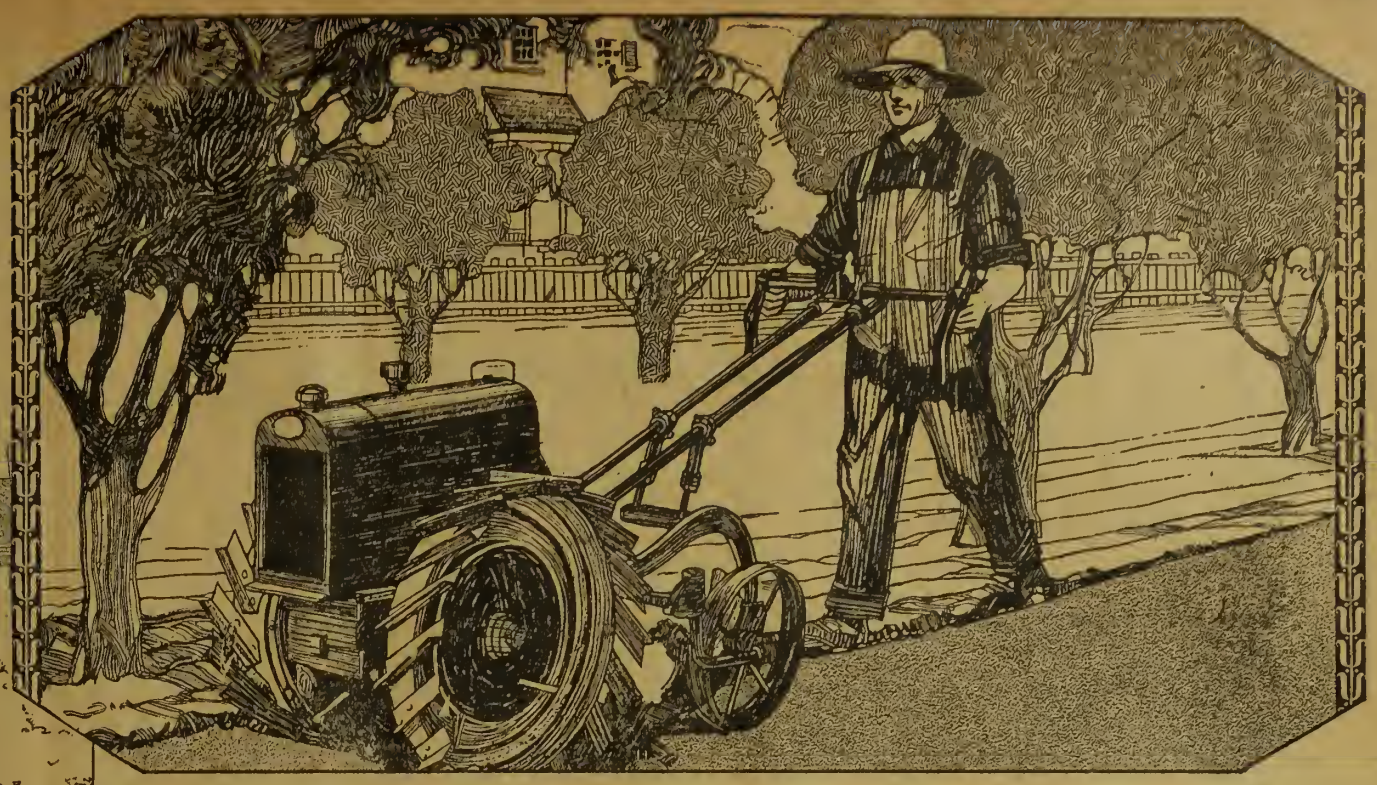
In 1910 the value of all farm property in the United States was approximately 41 billions. Estimates place valuation on the same in 1915 at 51 billions. Since 1900 the increase in farm values has been greater than all the value of all farming properties prior to that date. Presumably the rate of increase of these valuations will be greater during the coming decade. At least, this is the estimate of many shrewd observers and for the reason that European conditions are such that great demand will be made upon American food producers. The United States is the only nation from which Europe expects such assistance to come. Moreover, our own prosperity and the maintenance of the industrial and financial strength to which our country attained during the war are inextricably bound up with the revival of prosperity in Europe. We moved long since past the point where we could even consider the possibility of economic self sufficiency.

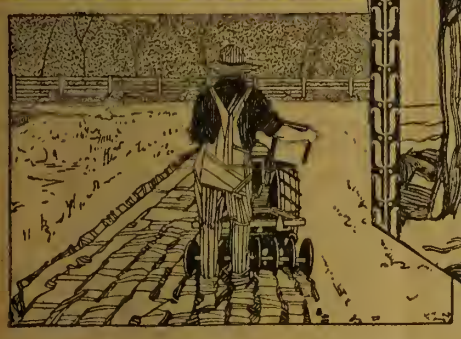
SMOTHERED

Producers have overcome a vast number of obstacles in the way of cooperative advancement and have evolved, especially in California, notable examples of real and successful cooperation, and this has been in spite of opposition—where there should have been aid and comfort—from federal officials in Washington. Bean growers who would cooperate, raisin growers, peach producers and others have been called to Washington to prove to the satisfaction of this, that or the other official that their organization is not a trust.

Those who have believed that the country's truest and best advancement could be secured through the exercise of the cooperative spirit have endeavored to encourage it by introducing to congress the Capper-Hersman bill legalizing cooperative marketing. But the interests are busy. We have letters from representatives of the National Grange, the National Board of Farm Organizations and the American Farm Bureau Federation stating that this bill, beneficial to producers, is being smothered in committees. It will probably be of value if farmers will write the representative of their district and appeal for protection of the best interests of the country by the passage of this bill.

"Beating the Game" is an interesting little booklet full of valuable information you will be very much interested in. We have a copy ready to mail to you if you just fill out the coupon and mail today.



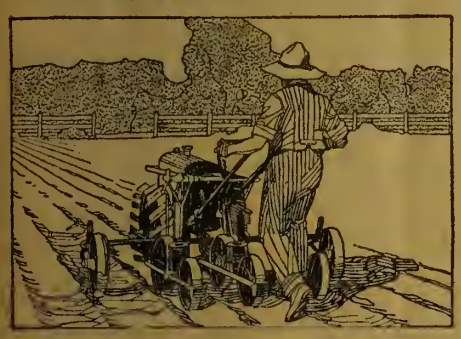


Discing can be done faster and at less expense with the Utilitor

You Simply Can't Farm Under Present Conditions to the Best Advantage Without a Utilitor

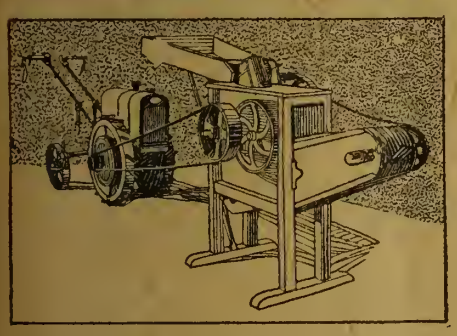
Farmers are making REAL MONEY by using their brains and letting the Utilitor do the work. This whole UTILITOR proposition is purely a matter of DOLLARS and SENSE. To show a profit on your farm you must make more money and SPEND LESS.

By working TWENTY-FOUR HOURS a day, if need be, at a cost to you of approximately FIVE CENTS AN HOUR for "gas" and oil, the Utilitor cuts farm wages in half, saves horse feed, and shaves your table expenses by ridding you of a lot of HUNGRY "HANDS". It does all that one good strong horse can do, PLUS all that one good gasoline engine can do. It is made by the Midwest Engine Company — one of the strongest and fairest factories in America— a factory that absolutely guarantees the Utilitor to DO its work properly. This guarantee is IRON CLAD and means exactly what it says.

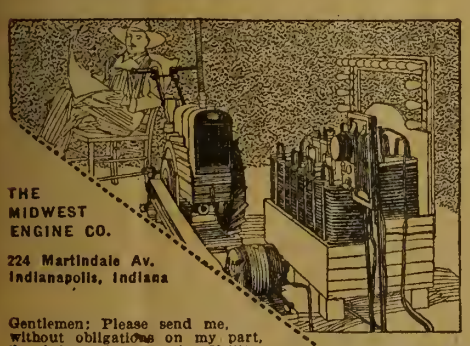


A Utilitor and three-row gang seeder will drill or hill 35 different kinds of seeds

The Utilitor has no equal for one-row nursery truck garden or berry cultivation



One of many belt uses: Operating corn sheller



THE MIDWEST ENGINE CO.
224 Martindale Av.
Indianapolis, Indiana

Gentlemen: Please send me, without obligations on my part, the information on the Utilitor as checked below:

☐ Booklet "Beating the Game" ☐ Who is my nearest dealer?

(If your will give us the information requested below we will be better able to show you how the Utilitor fits your particular problem.)

This farm lighting unit, Utilite, is made especially for the Utilitor

I own.....acres. I have under cultivation.....acres

I am raising..... Nature of soil .....

Level?..... Rolling?..... Hilly?.....

The Safest and Most Practical Orchard and Fruit Worker Yet Devised

The Utilitor is especially well adapted for work in orchards. We offer a disc, spike tooth harrow, spring tooth harrow and a set of cultivating tools, any of which are suitable for orchard cultivation. With our hitches a wide range of adjustments for these various tools is possible. The Utilitor is only 36 inches high, permitting cultivation beneath low hanging branches much closer to trunks of trees than is possible when horses are used. There is no danger of the Utilitor nipping fruit and branches. It is so easily controlled that the operator need have no fear of injuring trunks of trees, surface roots or branches as is the case with horse cultivation.

Cuts Expenses to the Bone and Does Better Work for The Truck Gardener

A number of implements which we recommend for use with the Utilitor are especially adapted to the truck gardener's use. The three row gang seeder permits the drilling or hilling of 35 different kinds of seeds in rows varying in width from 9 to 36 inches. Our one row cultivator and disc are adapted for cultivation both astride and between rows, for the Utilitor has a vertical clearance of 8 inches and a horizontal clearance of 10 inches between the bull wheels. Equipped with cultivating rims the Utilitor is 18 inches wide, so it may easily pass between the rows of larger crops. Our three row cultivator is designed to cultivate the crops planted with the three row gang seeder. With our set of cultivating tools a number of combinations can be arranged for various kinds of cultivating, both deep and shallow, astride or between rows of different widths.

The Utilitor Will Thoroughly Motorize Your Farm

The Utilitor is a portable gas engine for driving belt machinery requiring not over 3 horse power. Remember this machine will move from job to job under its own power. It is the untiring friend of man and woman. It gladly helps lift the burden of work around the house or barnyard. Some of the belt uses of the Utilitor are, operating corn sheller, cream separator, washing machine (churn, and charging batteries for an electric lighting set. It can also be used, in conjunction with a cart, to feed stock or haul one horse loads around the place.

No self-propelled farm equipment designed in recent years offers a wider range of usefulness in the field or on the belt than a Utilitor.

DEALERS

The Utilitor is the most active merchandise on the market today because farmers NEED it 365 days out of the year. Our selling plan is so complete and thoroughly financed that we are positive our plan will interest you. Territory is being rapidly allotted.

Dependable Power

FRUIT CROP REPORT

(Continued from Cover Page.)

prevalent in some prune sections, but nothing serious is threatened at the present time. On the whole, the fruit season is from one to two weeks early, and with seasonable weather conditions the outlook can be considered good.

Geo. P. Weldon, Chaffey Union High School, Ontario, San Bernardino County

As you know, I am employed by the Chaffey Union District and practically all my work is within this district, therefore, I am not competent to judge as to the condition of crops outside of this district and in the county. Of the crops that you name, we are growing commercially, only apricots, apples, peaches and pears. The bloom of apples is very uneven and it is too soon to accurately predict what the crop will be, however, I would place the condition at present at 100 per cent. There has been some local damage to apricots from frost, although most of the orchards in the district escaped. Old trees are inclined to be light and I would not place the condition higher than 50 per cent of both young and old trees. At the present time peaches promise a very heavy crop; 100 per cent condition or over. There is some thrips damage. Pears are grown only in a very limited way within the district. The condition so far is good. Trees are just blooming.

D. D. Sharp, Horticultural Commissioner, Riverside County

Almonds: Injured by late frost; amount of damage not yet determined.
Apples: One hundred per cent.
Apricots: Injured by late frost; amount of damage not yet determined.
Cherries: 100 per cent.
Peaches: 100 per cent.
Pears: 100 per cent.
Prunes: 100 per cent.

A. L. Shively, Santa Paula, Ventura County

Almonds: small acreage, prospect good.
Apples: practically none grown.
Apricots: bloom very uneven, 40 per cent estimate.
Cherries, peaches, pears, prunes: none grown commercially.

J. C. Metzgar, Secretary Santa Ana Chamber of Commerce, Santa Ana, Orange County

Almonds: none grown here.
Apples: where cared for look promising.
Apricots: uneven, spotted probably 80 per cent crop.
Cherries: none grown here.
Peaches: very few grown.
Pears: very few grown.
Prunes: none.

Paso Robles Press, Paso Robles, San Luis Obispo County

Almonds: 75 per cent (slight damage in lower places by frost).
Apples: coming into blossom.
Apricots: 80 per cent.
Cherries, peaches, pears, prunes: now in blossom. Indications are for heavy crops. We are glad to be able to give above information. Call again in about a month for further news on fruit.

Geo. C. Nevins, Hemet, Riverside County

Almonds: not grown commercially.
Apples: not grown commercially.
Apricots: 30 per cent, 40 per cent of 1919 crop.
Cherries: none.
Peaches: normal crop.
Pears: none.
Prunes: none.

Thos P. Redmayne, Horticultural Commissioner, Marin County

Fruit crop conditions in Marin County are practically the same as last year at this period though the rainfall is much less, being 20 inches compared with 37 last year. Annual crops: hay, grain, truck crops and pasturage are fully 100 per cent for this date.
Almonds: 100 per cent of full crop (not grown commercially.)
Apples: 100 per cent of full crop.
Apricots: 40 per cent of full crop.
Cherries, 110 per cent of full crop (few grown commercially.)
Peaches: 90 per cent of full crop.
Pears: 100 per cent of full crop.
Prunes: 100 per cent of full crop.

Wm. Gould, Horticultural Commissioner, Yolo County

Almonds: 35 per cent.
Apples: 100 per cent.
Apricots: 75 per cent.
Cherries, 100 per cent.
Peaches: 100 per cent.
Pears: 100 per cent.
Prunes: 80 per cent.

F. W. Waite, Horticultural Commismissioner, Tulare County

Almonds: Not commercially grown.
Apples: Not commercially grown.
Apricots: 100 per cent crop.
Cherries: Not commercially grown.
Peaches: Not commercially grown.
Pears: 100 per cent.
Prunes: Not commercially grown.

H. J. Baade, Farm Adviser Napa County

Apples: 100 per cent.
Apricots: 75 per cent.
Cherries, 100 per cent.
Peaches: 100 per cent.
Pears: 100 per cent.
Prunes: 100 per cent.
The crop outlook is exceptionally good.

W. D. Butler, Horticultural Commissioner, Napa County

Almonds: 100 per cent.
Apples: 90 per cent; lighter bloom.
Apricots, 10 per cent; brown rot.
Cherries: 100 per cent.
Peaches: 100 per cent.
Pears: 75 per cent; thrips.
Prunes, 75 per cent; drouth and thrips.

Redlands Facts, Redlands, San Bernardino County

Almonds: frost took most of them.
Apples: O. K., apparently good crop.
Apricots: very scant crop.
Cherries: good.
Peaches: crop short.
Pears: none here to speak of.
Prunes: in Banning section reported in good quantity.

Chas. F. Collins, Horticultural Commissioner, Tulare County

Almonds: not of commercial importance.
Apples: splendid showing at this date (April 14).
Apricots: very good, probably 90 per cent.
Cherries: not grown here.
Peaches: fine outlook, except in orchards which suffered for water last season.
Pears: not grown in commercial quantities.
Prunes: same as peaches.

A. Hancock, Bakersfield, Kern County

Having sold my orchard I have not been keeping as close tab on conditions as usual, but will say from my observation and experience I can conceive of no reason why there should not be practically 100 per cent crop on most or all of these fruits. Spring weather conditions have been excellent, the only thing that might have an effect was last year being dry; some orchards had not sufficient water last fall.

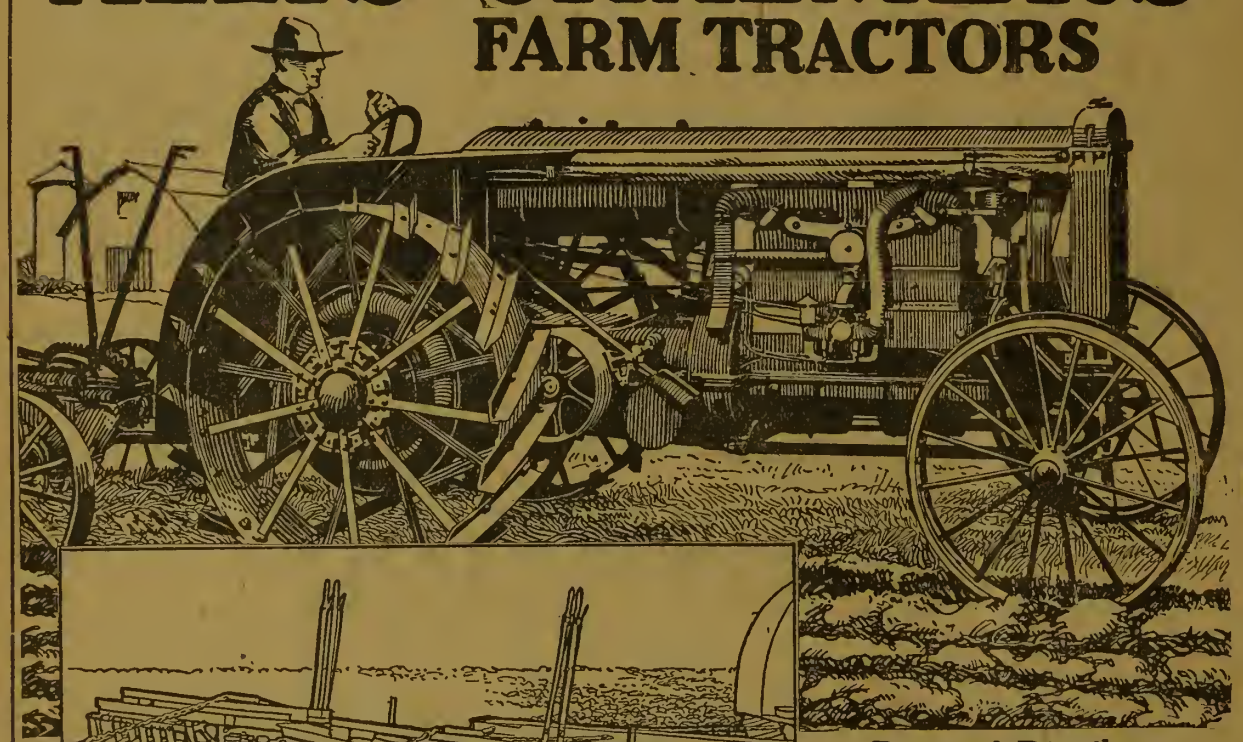
California Fruit Distributors, Sacramento, Wilmer Sieg, Manager

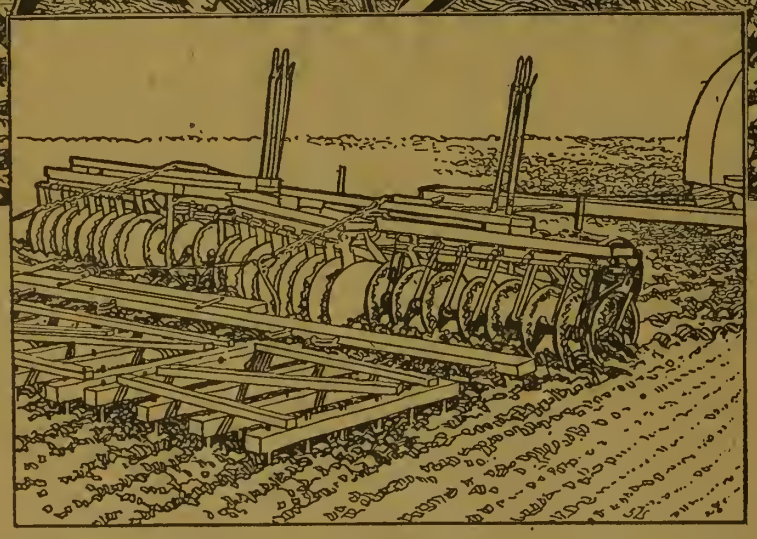
We have not as yet collected our crop reports but the situation as concerns the tree fruits that are grown in the several territories surrounding this distrtict and using Sacramento as a gateway, is practically on a 100 per cent basis. Moisture has been sufficient and conditions are extremely healthy. We had anticipated a season possibly ten days ahead of last year but the recent cool weather is delaying maturity. This will have the effect of making the fruit of good size and perhaps our fruit will commence about the same as last year when the first carload of cherries left about May 5 and the first carload of assorted deciduous fruits was shipped June 5. We have never seen any better prospects and look forward to excellent crop conditions throughout.

We know nothing whatever of apples because there are none in this section and the only prunes we can quote you on are those that are shipped in the green state.

As regards almonds we have not investigated the situation, although

ALLIS-CHALMERS
FARM TRACTORS





After plowing—then what?

After the Allis-Chalmers 18-30 has done your plowing—pulling four 14-inch bottoms—use it for discing, harrowing, breaking up the soil. The weight is evenly balanced and the 18-30 will not pack down the soil. And this same tractor will pull a 10-foot road grader or a 28-inch separator with power to spare.

Owners are already reporting kerosene consumption of two gallons to the acre, plowing sixteen acres to the working day of 10 hours. Other work is done at equally low costs.

Write for full details—we will be glad to send you carefully compiled information that will be of real help in selecting the tractor you should buy.

Backed by 65 Years' Experience

For 65 years the Allis-Chalmers Manufacturing Co. has been known as one of the largest companies in the world making high grade machinery. This is your guarantee of satisfaction.

NATIONALLY DISTRIBUTED—Allis-Chalmers Farm Tractors are nationally distributed by a chain of distributors, branch houses and dealers that cover the country.

Principal Distributors and Branches:

Triangle Motors Co., Bloomington, Illinois
Triangle Motors Co., Indianapolis, Indiana
Murphy Machinery & Equipment Co., St. Louis, Missouri
New Jersey Automotive Co., Burlington, N. J.

Steels

Make the Maxwell Thrifty

SEVERAL million dollars have been expended to provide more elegance, more refinement, more comfort to the current Maxwells.

It is in ever so many ways a superior appearing car; superior, too, in action.

But not a single pound of weight has been added to burden the work of its great engine!

Therefore, despite the many processes of improvement, it doesn't cost a penny more to run a Maxwell than it did a year ago.

The underlying principle of every Maxwell is to give economic transportation.

This means light weight. But it means strong steels, as well.

It is no easy trick to provide both lightness and strength in metal.

Such a rare combination means high cost steels.

And you would find, if you compared a Maxwell with *any* car, that it equaled that car pound for pound in fine metals.

How such steels affect your pocketbook is obvious.

1. They are light in weight and hence give more mileage on a gallon of gasoline.

2. As they are fine steels they give *long* and *uninterrupted* wear.

Which are but two of many reasons for that definite tendency of world-wide friendship towards Maxwell.

In six years nearly 400,000 have found their answer to the motor car question in a Maxwell.

This year 100,000 Maxwells are being produced.

This will supply but 60% of the demand.

HAYES SPRAYER BOOK

FREE—Astounding Facts on "Fruit-Fog" Spraying!

Send the coupon. Read why Fruit-Fog—the fog-like, super-spray—is the ONLY spray of vapory enough fineness to work into the microscopic niches in bark, buds and foliage, where no coarse spray can reach. Convince yourself that only by *killing* these millions of *hidden* pests are big yields possible. Then you'll understand why Fruit-Fogged Orchards produce *amazing crops*—make *fortunes* for their owners each year.

HAYES FRUIT-FOG SPRAYERS

Fruit-Fog is produced by Hayes 300 lb. high pressure and the famous Hayes nozzle. The spray envelopes everything like a mist, and has wonderful *adhering* power. No drops form—no solution wasted—no buds or leaves knocked off—as with coarse, heavy, low pressure sprays. Fruit-Fog Sprayers are skillfully made to give enduring service and greatest efficiency under high pressure. Service stations in all parts of the U. S. assure new parts within 24 hours in case of accident. Famous Fairbanks-Morse "Z" Engine means reliable engine service.

Hayes Fruit-Fog Gun

World's fastest spraying apparatus. Simple twist gives long spray for tall trees, or wide spray for closeup work. Does better work and saves solution. Book gives full details.

we hear that the crop has been seriously interfered with and this is practically the only crop we hear of as being affected.

Sanitary Fruit Company, Inc., Red Bluff, Tehama County

Almonds: Killed by frost, probably 10 per cent of crop. Some new acreage just coming into bearing.
Apples: Too early to estimate. Acreage about same as last year.
Apricots: Killed by frost, practically entire crop gone. Acreage small.
Cherries: Killed by frost, practically all gone. Acreage small.
Peaches: Muirs fairly good. Elbertas light. Probably a half crop of peaches. About same acreage as last year.
Pears: Promise full crop. Acreage about same as last year.
Prunes: Promise good but not bumper crop. Considerable new acreage coming into bearing this year.

Geo. W. Harney, Horticultural Commissioner, Yuba County

Almonds: 100 per cent, except Ne Plus and Nonpareil which are 40 to 50.
Apples: 100 per cent so far as can be determined at present.
Apricots: 100, but shothole fungus quite prevalent.
Cherries: 100. Cold April rains may lower percentage.
Peaches: 100. Cold April rains may lower percentage.
Pears: 100 so far as can be determined at present.
Prunes: 100.
Thompson Seedless vines promise exceedingly well.
Wine grape vines promise exceedingly well.

Claud D. Tribble, Elk Grove, Sacramento County

Almonds: 30 per cent.
Apples: 75 per cent.
Apricots: 50 per cent.
Cherries: 90 per cent.
Peaches, 100 per cent.
Pears: 100 per cent.
Plums: 100 per cent some varieties; others entire failure.
Prunes: 90 per cent. Too early to make accurate estimate.

A. L. Rutherford, Horticultural Commissioner, Stanislaus County

Almonds: 90 per cent.
Apples: 100 per cent.
Apricots: 50 per cent.
Cherries: 100 per cent.
Peaches: 90 per cent.
Pears: 100 per cent.
Prunes: 90 per cent.

Mrs. Clara K. Graham, Ramona, San Diego County

Apples: Promising.
Apricots: Fruit mostly killed by late frost.
Peaches: Good.
Pears: Promising.

F. C. Brosius, Horticultural Commissioner, Sacramento County

It is a little too early for definite information.
Almonds: 60 per cent.
Apples: 100 per cent.
Apricots: 60 per cent.
Cherries: 100 per cent.
Peaches: 100 per cent.
Pears: 110 per cent.
Prunes: 80 per cent.

Kent S. Knowlton, Horticultural Commissioner, Kern County

Almonds: 100 per cent.
Apples: 100 per cent.
Apricots: 100 per cent.
Peaches: 100 per cent.
Pears: 100 per cent.
Prunes: 100 per cent.

Wm. B. Jackson, Ontario, San Bernardino County

Apricots will be a good crop this year. Trees are full at this time. We had a freeze the 27th of March that froze some of the first cots that set, but there will be plenty left.
Muir peaches will not be more than one-fourth crop. Other varieties seem to be well loaded with bloom. The ground has been well soaked from the rains we have had and with proper cultivation trees and vines will put on a good growth this year.

Geo. Marchbank, Horticultural Commissioner, Madera County

Almonds: 90 per cent.
Apples: too early.
Apricots: 65 per cent.
Peaches: 100 per cent.
Prunes: 90 per cent.

J. P. Dargitz, Soulsbyville, Tuolumne County

Almonds: Not grown here.
Apples: Promise so far about two-thirds of a crop.
Apricots: All frost killed.
Cherries: Promising. Just beginning to bloom.
Peaches: 95 per cent frost killed. Bloomed six weeks too early.
Pears: Very promising.
Prunes: Practically none grown.
Plums: All frost killed.
Very warm and dry during January. No frost during the month of March, much rain and snow. March 26 one foot of snow and mercury registered 17 degrees with peaches and plums in full bloom.

E. T. Reynolds & Son, Chico, Butte County

Almonds: 55 per cent.
Apples: 100 per cent.
Apricots: 50 per cent—practically none grown here.
Cherries: 100 per cent.
Peaches: 60 per cent.
Pears: 100 per cent.
Prunes: 80 per cent.

M. Sharpe, Vacaville, Solano County

Almonds: 60 per cent.
Apricots: 100 per cent.
Cherries: 100 per cent.
Peaches: 100 per cent.
Pears: 40 per cent.
Prunes: 100 per cent.
Pears badly damaged by thrips. Also some late plums. Most plums a normal crop.

J. F. Benton, Horticultural Commissioner, Humboldt County

Apples: Conditions good. Heavy bloom.
Cherries: Fine bloom. Prospects good.
Peaches: Light frost damage.
Pears: Good blooom. Fine prospects.

Niles Cannery, Alameda County

Almonds: Heavy.
Apricots: Immediate vicinity, good.
Cherries: Good.

John A. Winkelman, Horticultural Commissioner, El Dorado County

It is a little early for a complete estimate.
Our peach crop is completely gone in some districts, especially the lower part of the Coloma district was hit hard. Plums and pears are looking well, but I cannot tell as yet what effect the last storms have had. Some Winter Nelis orchards got the worst of it and a few Bartletts are commencing to show weather effects.
I will send you complete figures in about ten days.

Arthur E. Beers, Horticultural Commissioner, Merced County

Almonds: Good set in spite of frost and wind injury—85 per cent.
Apples: No commercial orchards.
Apricots: Poor bloom and injury by frost and wind—70 per cent.
Peaches: Good set. Curl leaf severe.
Prunes: Very small commercial production.

Leonard H. Day, Horticultural Commissioner, San Benito County

Apples: 100 per cent.
Apricots: 80 per cent.
Cherries: 100 per cent.
Peaches: 100 per cent.
Pears: 90 per cent.
Prunes: 100 per cent.

California Prune and Apricot Growers, Inc., San Jose, H. C. Dunlap, Sec.

At the present time impossible to estimate prune crop for the state. In most districts growers have been a little in fear of very short crop, owing to drouth conditions; also infestation of thrips in many districts. At present reports come in that prunes are in process of heavy setting. Would not confirm this for the present. In a few weeks time will have far better ability to estimate.
For the most part apricot reports throughout the state materially short of last season's crop. Summing up as a whole, would say state may produce in the neighborhood of 70 per cent of last season's crop. Considerable frost damage in the interior in Southern California. Coast districts of Southern California, crops light where early setting prevailed last year. Through the San Joaquin Valley for the most part similar reports—crops light on numerous orchards where

heavy setting prevailed in the past season. Districts about the Bay report more or less damage from brown rot, twig blight or other manifestation of certain fungus disease. In spite of this we are inclined to estimate crops somewhere near the average set for the state.

Santa Ana Register, Santa Ana

Apricots: Estimated crop is 50 to 60 per cent of last year. Crop last year good. Orchards are spotted, some fruit coming on early and some late. Early fruit to be of good size. A little early to report on size of late fruit. Early fruit probably be ripening about July 1, earlier than usual. There are about 800 acres of apricots in county. Some orchards taken out in last year to give place to Valencia oranges. Most of apricots here will be dried.

W. A. Shepard, Auburn, Placer County

"We are looking forward to one of the best fruit seasons the industry has ever known," said E. S. Culver, manager of the Auburn Fruit Exchange. "Cherries are looking fine and will be a full crop. Japanese plums were hurt some by a hail storm, unusual in this locality. This especially applies to Wicksons and Santa Rosas. European varieties of plums, peaches and pears promise to make a tremendous yield in this section."

L. V. Haupt, Horticultural Commissioner, Kings County

Apricots: 50 per cent normal.
Peaches: 85 per cent normal.
Prunes: 75 per cent normal.

California Peach Growers, Fresno, J. F. Donleavey

It is rather early and on account of our not receiving reports from all over the state we are unable to state definitely in regard to the prospects of the peach crop this season, but from the reports that we have on hand we are led to believe that it will be about an average crop.

The Farmer and the High Cost

By G. H. Hecke

INCREASED production at this time and for some time to come is absolutely essential to the promotion of such harmonious procedure as that which has been obtained in the past. This may be accomplished under existing conditions only by the application of closest study to his individual needs on the part of the farmer and fruit grower of the state.

Looking back over the history of this state and of the United States, we find that the farmer and fruit grower have worked the hardest, worked the longest hours and we find also that as a class they have received less than those engaged in less arduous occupations.

As the years passed and the germ of cooperative associations and marketing organizations became a reality, profiting by inadvertent errors of earlier days, the position of the agriculturist in California at least became more assured; it offered to the farmer a more definite goal, something worth striving for, and promising something more than the mere living which was the reward of his fathers before his time.

No one today who is well informed would seek to lay the high cost problems at the door of the farmer, for he of all has received the veriest mite in the distribution of industrial dividends.

The farmer is asked to pay $75 for a suit of clothes, whereas the five pounds of cotton in the suit netted him $3, or at the rate of 60 cents a pound. The hide for which he received $5 makes 12 pairs of shoes to be sold for from $8 to $18 a pair. He gets $10 for a barrel of flour, but the baker gets $55.

Does not the farmer also feel the press of the increased cost of all those necessary adjuncts to his business of producing? What of the increased cost of labor, of fertilizer, of seeds, of farming tools, building material?

No well informed person would have the hardihood to challenge the farmer on the high cost issue, unless it be for the purpose of advertising the farmer's right to a better regulated scheme of dividing the earnings wrought by his hands from the soil and which through all the ages he has never enjoyed!

When we come down to solid facts concerning this modern goblin, "The High Cost," we find it touches the larger mass of our people in terms of necessary food and clothing. As we look at these problems with a calm, collected mind and critical eye, it must be apparent to everyone that these questions cannot be remedied or answered by legislative action of federal or state governments nor can they be solved by individual or party platforms. It is even illogical, unreasonable and unjust that any combination having no part in the production of an agricultural product should have the power to fix the price by which that product of the soil should be sold. The price should be set by the producer alone and regulated by the law of supply and demand.

We in California thus have the framework upon which our state's well-being and our readjustment problems may be safely erected, and with our cooperative associations working in harmonious accord only success should crown our efforts.

If I were asked for a rule and guide for the farmer to apply to his every day activities, I would give it in the single word "economy."

Not only the economical features involved in buying, planting and marketing should be considered, but also true economy along all lines, and a successful farmer today must produce as far as is possible all of those things which enter into his operations, since it is through his enforced dependence upon outside agencies that he suffers the greatest degree of preventable loss.

WILD BEETS

These are the sort that give the grower wild beats of the heart. Near Oxnard we found Rudolph Pfeiler plowing a huge field with a 60 horse power tractor. It was drawing five 14 inch mold board plows, a total of 70 inches turned over, and a weighted, toothed harrow trailed behind. With this he plowed and harrowed about an acre an hour. When asked what he intended planting he replied: "Nothing." The ground will lie idle this summer, not alone to rest the soil, however. Last year he was given some poor beet seed which largely produced "wild" beets that flowered and seeded instead of making marketable beets. So he was plowing them under to get rid of them, for every beet was growing vigorously. No other crop will be planted until January, 1921, when beets will again be sown.

A SUBSTITUTE FOR WOOD?

A plump fortune awaits the person who can devise a practical and inexpensive substance to replace wood in the construction of fruit containers. At the present time citrus associations are paying top prices for box wood and have been forced to buy large standing forests in preparation for the next year or two.

Oranges and lemons require rigid protection or they will be found worthless upon arriving at market. It is thought that development along this line will take the form of experiments with thick paper and cardboard compositions, chemically treated to insure stiffness. Perhaps a process will be devised for utilizing old rags and newspapers in the manufacture of a substitute.

At first glance the task of creating a successful substitute seems fraught with insurmountable barriers. Yet, barely ten years ago the tractor was not taken seriously as a rival of the horse.—J. De C.

BEST TRACKLAYER TRACTORS

THE ability of the "Sixty" to adapt itself to all classes of work is one of the reasons for the remarkable success of this tractor—plowing and harrowing—side hill harvesting—heavy work of the rice fields—hauling—road building—the heavy duty of the logging industry, etc.—are all handled with ease as well as all classes of belt work.

The reasons for this superior performance of the BEST TRACKLAYER SIXTY is quality of material used and proven design.

The "Sixty" costs a little more than the ordinary tractor, but the quality is well worth the additional cost—assurance that you are buying the best that is built.

There is a Best dealer in your vicinity who will gladly show you the many exclusive features of this BEST TRACKLAYER TRACTOR.

Write for your dealer's name.

AVOCADO GROWERS MEET

The fifth annual meeting of the California Avocado Association will be held in Los Angeles, May 7-8. The place will be the Y. M. C. A. auditorium, 715 South Olive Street.

A separate room will be provided for an exhibition of fruit, and it is hoped to make this an attractive feature. On Friday afternoon there will be a business meeting for members only. Friday evening at 6:30 there will be an informal dinner at the City Club, Investment Building. The following professional and business men will tell, in five minutes each, why they are interested in the avocado industry: Major J. B. Coulston, Dr. A. S. Lobingler, Dr. D. W. Bartlett, Dr. H. S. Miles, G. H. Woodruff, J. T. Fitzgerald. The formal program will be as follows:

Saturday, 2 P. M.—Report of Committee on Varieties, Chas. D. Adams; Surgery of the Avocado, Dr. W. W. Hitchcock; Guatemalan and Mexican Avocados in Florida, John B. Beach; Insect Pests of the Avocado in Florida; and Insecticides Which May be Used Without Injury to the Tree and Fruit, G. F. Moznette.

Saturday, 10 A. M.—Address, Pres. Wm. H. Sallmon; Selection of Budwood—The Importance of Having a Department for Such Work, C. S. Milliken; Maturity Work on Avocados, E. M. Chace; Propagation of Nursery Stock—The Successes and Failures of the Nurserymen, Robt. J. Mather; Marketing Avocados, A. F. Yaggy.

L. B. Scott, manager of the California Nurserymen's Bud Selection Association and a well known authority on all that pertains to avocados, will deliver an address at one of the sessions.

PRUNING DEMONSTRATION AT DAVIS

The new system of pruning of the university farm, whereby the trees will come into bearing two years earlier, keep in a more healthy state and produce more and better fruit than under the old system, will be demonstrated by men who have made the new system successful.

Demonstrations of spray guns and power outfits will also be made. There will be three leading power spray outfits at the farm for demonstration, as well as the various types of spray materials. It is planned to have an example of different diseases and a sample also of their control method.

A display is planned of the various kinds of grafts, the different tools used in budding, grafting, pruning and other agricultural operations.

Orchard men throughout the state were invited today by the horticultural division to visit these demonstrations while visiting the university farm on Picnic Day.

STANDARDIZATION OF BERRIES

Horticultural Commissioner Ryan of Los Angeles County is sending out the following letter to dealers and shippers handling berries:

"Of chief importance is the regulation forbidding the preparation, sale or offering for sale of a deceptive pack, i. e., any package of fruit or vegetables which has in the outer layer or exposed surface, fruit or vegetables which are so superior in quality or condition to those in the interior of the package or the unexposed portion as to materially misrepresent the entire contents.

"Berries sold or offered for sale in packages shall be mature but not overripe, well colored for variety and locality, virtually uniform in quality, virtually free from insect and fungous pests, rots, bruises, frost injury, sunburn and other serious defects. Packed berries in addition shall be virtually uniform in size. The regular compact arrangement of all or part of the fruit in any container or subcontainer constitutes a pack.

"All crates or containers of berries except subcontainers (baskets) when packed and offered for sale shall bear upon them in plain sight and in plain letters on the outside, name of farm where grown and postoffice address, or name and postoffice address of person, firm, etc., who first packed or authorized packing of same, or business name of packer and postoffice address; also variety of fruit and minimum net weight. Regular inspections will be made at the large markets and in the field, as well as in retail stands. Violations of any of the provisions of the fresh fruit standardization laws constitute a misdemeanor.

APPLE APHIDS THREATEN

Inspector Tate of the federal office of standardization, stationed at Watsonville, states in a recent report that from the few orchards inspected in different parts of the Pajaro Valley it seems likely there will be a very severe infestation of green and rosy apple aphis this season. Unfortunately weather conditions have made it impossible to spray with nicotine, and as the trees are coming out in leaf very rapidly, it is to be feared that the aphis will not be thoroughly controlled. Trees in many sections of the valley show indications of very light bloom this year.

CALIFORNIA STANDARDIZATION

J. A. Campbell, assistant director of the horticultural division, New Zealand department of agriculture, who recently visited California and the coast to study fruit producing and marketing conditions, has returned to New Zealand, and in an account published in the Journal of Agriculture makes the following statement:

"All concerned in the American fruit industry are agreed that the business could not possibly have reached its present extensive and prosperous position had it not been for the stabilizing effect of the standard packing laws. There are at least four grades of apples taken from a tree—first, second, and third grade, and culls. Without standard grading a buyer could not tell, short of personal inspection of each case, which of these or what percentage of each he was buying; consequently trade in a large way would be considerably hampered, or the buyer, to protect himself, would offer much less than the possible worth of the fruit. With standard grading, however, a buyer can safely buy on grade and variety without having seen the fruit at all."

A NEW DEPARTURE IN APPLE INSPECTION

On March 18-19 a committee appointed by G. H. Hecke, director of agriculture, met in Watsonville for the purpose of discussing ways and means of making the apple inspection of the state more effective. The committee consisted of representative apple growers, packers, shippers from San Diego to Sonoma, and officials in charge of enforcing the standard apple act of 1917.

Several phases relative to apple inspection of more than general interest developed at this meeting. Car lot inspection to supplant the present system of packing house inspection met with unanimous approval of the committee. For the past few years inspection of the fruit as it was being packed has been in vogue. Beginning with the ensuing season, if present plans mature, the inspectors will select a representative sample (at least one box to each hundred) and carefully inspect each apple in each box selected, noting results as to defects and conformity with grade designations. A certificate will be issued on each lot, setting forth results of examination and no apple stamps which bear the legend "Inspected" will be used except on such lots as have actually been examined.

The committee went on record urging the adoption of a certificate that would actually be indicative of the condition of the pack and lot, rather than a mere statement of whether or not the lot in question conformed with the standards prescribed by law, a statement which is largely a matter of opinion and frequently as has been the case in the past reversed by the inspector at the point of destination.

Mr. Hecke's statement that the department of agriculture is considering a cooperative arrangement between the office of standardization and the federal bureau of markets was greeted with enthusiasm. The presence of F. W. Reed, representing the United States bureau of markets, assisted greatly in convincing the assembly of how far these negotiations have already proceeded. Such an arrangement would prove of incalculable benefit to the fruit growers of California, providing federal inspectors at terminals in the East would accept the California inspector's certificate as prima facie evidence of statements contained therein with reference to the consignment on which the certificate was issued. It is toward this ultimate object that Mr. Hecke is bending his efforts at the present time. The bureau of markets has for years contemplated the establishment of point of origin inspection, and if Mr. Hecke's plans materialize California will be the first state in the Union (which is quite usual when progressive moves of one kind or another are contemplated) to establish point of origin inspection that will be accepted and approved by the federal bureau of markets which for years has conducted the best terminal inspection conceivable.

FEDERAL

Double Cable Base

Tires

Federal Black "Traffik" Tread

TO the car owner, who takes the tire question seriously, the common sense of Federal Tires appeals with telling force.

The Double-Cable-Base, exclusive with Federal Tires, entirely eliminates unnecessary rim-wear—tube-pinching—rim-chafing—rim-cutting—blow-outs above the rim.

Put Federal Tires on *your* car and get the excess mileage that all Federal tire users enjoy.

THE FEDERAL RUBBER COMPANY, *of Illinois, Factories, Cudahy, Wis.*

Manufacturers of Federal Automobile Tires, Tubes and Sundries, Motorcycle, Bicycle and Carriage Tires, Rubber Heels, Horse Shoe Pads, Rubber Matting and Mechanical Rubber Goods

BEAN GROWERS MUST COOPERATE

(Continued from Page 687.)

high interest rates and as much profit as they can take on each shift during a period of from a month to a year until the consumer is ready to buy.

"At the two extremes we find these elemental conditions. The farmer must have all or part of his money as soon as he harvests his crop; the consumer will not buy a year's supply. Very often the middlemen, with their expert knowledge of supply and demand, get control of the crop and by nice artifices of publicity, and because of the needs of the consumers, work up the price to a figure absolutely hurtful to the bean industry and the farmer is then blamed for the high cost of living.

"Now how can we counteract this unfair condition? First and foremost by financing the crop half or all the way, so the farmer can get his money, or as much as he needs, early in the season, and until the consumer is ready to buy. In other words, the fundamental purpose of the association is to get, keep and maintain wise control of the crop and sell it as directly as possible to the consumer when he is ready for it. Your common sense should tell you this great purpose can not be carried out if you dump your crop each year and compete with each other in selling it.

Plan of Financing

"One of the most important and beneficial results of our efforts to date is to actually accomplish part of this purpose by financing the 1919 crop for nine months, at a cost not to exceed six per cent, and up to half its value, and the California Bean Growers' credit and commercial paper is today becoming known throughout the cheap money market of the East.

"I am hopeful enough to believe if all growers only realized how powerful would be their collective credit; if they did not waver in their allegiance to the association; if all could grasp the tremendous value of the goodwill we have built up to date under the most trying difficulties, we could next year get possibly 60 per cent to 80 per cent of the value of your crop in the beginning of the season, and at an even lower rate of interest. But some of you have weakened at the most critical turning point in our history. Some of you would foresake and abandon the association just as we are beginning to get real results. By so doing you are making it impossible to carry out this great purpose.

"I repeat that retaining wise control of the crop ought to be our motto. You as an individual can not do it. The association can. You all know that great corporations consolidate to economize in overhead expenses, and in order to cut out many duplications of expenses, but most particularly in order to be financially able to employ the very best experts. Now the association, by dividing the expense against a million sacks of beans or more, can for a few cents a bag employ the very best sales manager and the most expert service to supervise cleaning, warehousing and shipping, which constitute businesses by themselves, but which are only mere departments in this association. The association is actually handling over $6,000,000 of beans. With this collective financial strength we can advertise on a large scale, can put up package goods, carry on a great publicity campaign in defense of the industry, or win offensive battles for the association. We have our Journal, growing in strength monthly, ready for this purpose.

"Let me bring home to you the financial power which can be exercised on behalf of the bean industry by stating approximately that, when we spend $10,000 it only costs you a cent a bag, and that I believe that if we spent $100,000 in advertising some particular brand of beans we could so increase the consumption demand that we would at least get one-half cent a pound more for our beans, and the cost would be only one-tenth of a cent a pound, which means spending a dollar more to get five dollars additional return. But none of these things can be done if we do not believe strongly and unshakably in the purposes which we are trying to carry out. We can not proceed wisely to control the crop or carry out any continuous policy if you are not wholeheartedly back of the directors and officers.

Strong Association Reduces Expense

"With a strong association it is easy to cut down the internal expense of warehousing, cleaning, selling and shipping; we can cut out the duplicated sales machinery and waste of dealer distribution. We can employ experts to keep us statistically posted on the supply and demand throughout the world. We can prevent ruinous competition, get the large volume orders, and supply the continuous business of the small trade. But, to do this, to build up a selling plant, to accumulate this exact market knowledge, to perfect our sales machinery, to get the goodwill and confidence of the trade, to train up the personnel, for this big institution take time, ability, patience, courage, tenacity of purpose and money.

"I hope when we tell you all about what has actually been done, you will see that even our small overhead expense of less than 35 cents per sack, which also covers storage, taxes and insurance, through 22 months of difficulties, unavoidable hampering conditions and many disappointments, represents, not only operating expenses, but largely a wise investment in something of real tangible value, something of lasting, permanent benefit to the bean industry of the state, a machinery which will give you your money early and give you a maximum return year in and year out. It will remove violent speculative fluctuations and take the hazard out of your farming life—stabilize the business.

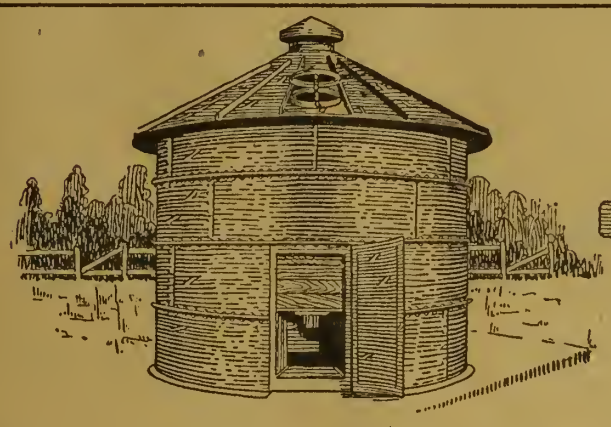
"Let me urge upon you that only by wisely controlling and financing crops and proving the cost of production and demanding a fair profit and cutting out the unnecessary chain of handling, duplicated sales machinery and wrong distribution and only by educating the consumer as to the real causes of the high cost of living will the farmer get what he ought to have and how can he do that except through an association or by the group method? If this is to be done, the bean grower must first learn that he must sacrifice the independence he temporarily feels when he sells his own crop and pockets the money early in the season.

Individuals Alone Cannot Obtain Legislation

"Again, will you as an individual grower go to Washington and fight for a bean tariff? No. Did the association? Yes. We need more farmers in politics and in congress and fewer lawyers and representatives of other special interests. We need an asociation to act in sympathy and concord with other agricultural bodies in the great movement that you must know is now on in this country—to put the farmer and his interests to the front.

"Will you go to the railroad commission and see if we can get a 'stop-in-transit' rate to New York so we can clean beans in Michigan and not pay two freights? Will you individually see if domestic beans have as good a transcontinental rate as Oriental beans crossing in bond? Will you go to Washington and do this? No! Should the association do it? If so, support it. This is the age of organization, labor, dealers, manufacturers, etc.—single-handed endeavor cannot avail against organized conflicting interests. You must speak and act collectively or your efforts will be futile.

"You all recognize that only with an association with large quantities of produce under one control can a uniform standard be established. Standardization has been the making of the citrus, apple and other industries. It encourages the grower to use better seed, use more care in threshing, stimulate the use of improved cleaning methods, gives bankers confidence, and elliminates cumbersome and unsatisfactory selling by sample. It is the modern way. Will the individual do it? No. Only an association will raise the standard of the bean industtry to a higher plane and put it on a par with the horticultural and other producer industries.



You Save the Wages of these Men when you handle your grain in bulk

Does a clear saving of $15 a day mean anything to you?

Bulk handling will save you at least that much in wages alone. It does away with these three high-priced men. It saves you the cost of sacks. It eliminates waste.

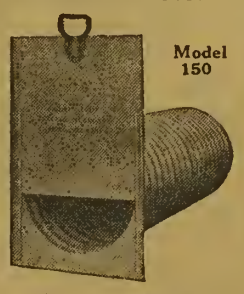
Calco Metal Grain Bins are used by all progressive farmers. These bins make possible a larger return on your investment.

Mail the attached coupon at once and receive the Calco Grain Bin Booklet. It contains figures and tells of actual installations which prove that bulk handling saves money.

Model 100

Calco Automatic Drainage Gate

Automatically drains submerged lands.



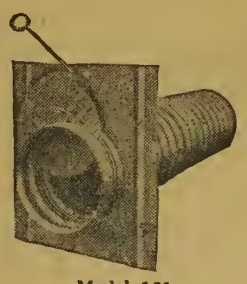
Model 150

Armco Lateral Headgate

An inlet headgate designed for use under slight water pressure. Light, and easy to operate.

Lyman Irrigation Meter

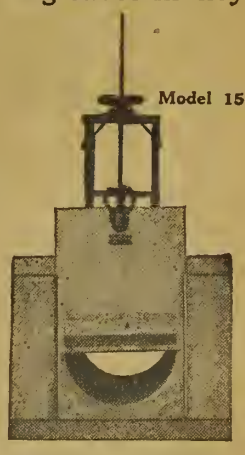
Gives an accurate record at all times of the water used for irrigation. Can be easily and quickly installed on weir by any one. Write for descriptive pamphlet.



Model 161

Armo Irrigation Gate

An easily installed and easily operated irrigation gate. No swelling or warping.



Model 153

Armco Lateral Headgate

An inlet headgate intended for use under varying heads of water up to six feet. Slide operates rapidly and easily.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Smilo and Napier

Can Napier grass be grown without irrigation? If not, how often would irrigation be necessary in light soil of a sandy loam nature? Is Smilo grass a perennial, and does it require much irrigation, if any, when it is grown near the coast? Are either of these grasses suitable for hog feed? If not, what perennial could be planted, other than alfalfa, that would make good forage for hogs? — Subscriber, Del Mar.

Napier grass will grow without irrigation, but those who get heaviest returns cut it once a month during summer and irrigate after each cutting. Smilo grass is a perennial bunch grass with a running root which stoles. It is much more resistant to drouth than Napier and will grow on dry rocky hillsides; a good forage grass. Both grasses are good for hog feed but Napier will yield the larger crop.

Native Nitrogen Nodules

A subscriber at Ripon, San Joaquin County, sends in samples of an annual native lupine, Lupinus micranthus, and asks if it would be a good cover crop.

It would, and also gathers nitrogen from the air.

Another, living at Klink, Tulare County, sends two annuals, a little vetch like plant, Lotus humistratus; also Lupinus densiflorus.

Names only are asked for but both are legumes and nitrogen gatherers and beneficial to soils.

Summer Potatoes

At what time should the summer crop of potatoes be planted? What are the best varieties and how should they be disinfected, if necessary? Is there a more profitable late crop?—Newcomer, Hemet.

We believe the questions are fully answered on Page 201 in the Cultivator of February 27. The potato is a profitable late crop; the seed should be dipped before cutting. A complete treatise on potatoes may be found in the Cultivator of November 15. One difficulty confronting the planter of the summer crop is the securing of ripened seed. This matter of seed curing is touched upon in the November number referred to.

Planting Cauliflower

Please tell me how to start cauliflower plants and what time of the year to plant them for early crop. Have tried it several times but the sun kills the little plants as soon as they come up.—Subscriber, El Cajon.

Cauliflower seeds are sown nearly every month in the year, but from February to July little sowing is done by commercial growers. The August sowing brings the main shipping crop, which is the early crop, usually harvested in January. Seeds should be sown in a well pulverized soil about one-half inch deep and the soil firmed or pressed down with a board after sowing. Transplant when six weeks old. If sun burns the young plants, start them under a cheese cloth cover and gradually harden them to the sun during the last week or ten days before transplanting.

Rabbit Paralyzed

Have been feeding pet rabbit grass and weeds. For last few days has had no control of her hind legs, though her appetite continues good. — Subscriber, Wasco.

Have pondered over this for some time trying to find some reason for condition of rabbit. It has paralysis and there is not much cure for this. A teaspoon of brandy in half a glass of milk will give relief if given soon and if patient is strong enough may overcome it. Best to kill it if bad case.—W. D. W.

Sparrows

Is there any way of ridding one's place of sparrows? We have a small place near town. We planted a lovely garden and the sparrows took it clean excepting for the onions and potatoes. (The beets, carrots, peas, radishes and even our alfalfa patch they cleaned). We have a flock of chickens and I notice the sparrows seem to like the grain I throw out. As the chickens are fenced in and the garden is also I thought I might poison some grain and that way get rid of them. Which grain and what kind of poison would you advise? Any information or suggestion you could offer would surely be appreciated. We are very anxious to have a garden and some alfalfa and green feed for our chickens, but these awful sparrows clean things up before they can get started.—Subscriber.

See page 388 of the Cultivator of March 6, 1920. The trap there illustrated and the poison and other methods of control recommended may aid you. The trap method is really the most satisfactory.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Accident Compensation

About eight months ago while employed as a railroad engineer in interstate traffic, I fell from my engine and met with a serious accident from which I have not yet recovered. I have received nothing as compensation and I wish to know what remedy I may have.—Subscriber, Porterville.

There is a federal law relating to the liability of common carriers of the railroad to their employes, which is exclusive in the case of employes actually engaged in interstate traffic, of all state remedies. This law provides that the railroad shall be liable for damages to the employe suffering injury while employed or, in case of his death, to his family. It further provides that any contributory negligence on part of employe shall not bar a recovery, but shall merely diminish the damages. The action to recover must be commenced within two years from the day the cause of action occurred. Such actions have been commenced in the state courts and have also been taken in the federal courts.

Making Concrete Forms

Has a farmer the right to make his own concrete forms for making concrete pipe lines on his own place? May he use hired help in this work?—Subscriber, Hughson.

It would seem that the only obstacle in the way of making such forms would be the fact that there is some patent issued and it would hardly seem that any patent could cover such a common matter. In order to determine whether there was any patent issued you would have to ascertain from the government patent office. As a matter of fact, it is very common practice for individuals to make their own concrete forms of all kinds, and there is no known reason why

Aeroplanes

Developments in aeronautics have found us ready with a grade of Zerolene for each type of engine.

Thousands of gallons of Zerolene Liberty Aero Oil gave service to the U. S. and Allied Governments during the war.

There are grades of Zerolene for the Correct Lubrication of your automobile, truck and tractor. Ask your dealer or our representative.

hired help could not be employed in making them as it is done every day.

Stepdaughter's Name

Daughter by former marriage has since second marriage taken stepfather's name. May she legally continue to use this name and sign legal papers in such name, or is it necessary that she take some legal action to change the name, and if so, what is the nature of this action?—Subscriber, Hughson.

It has been held by the courts that the name given to a person at baptism is presumed to continue, but if after his baptism he adopts and uses another name by which he is subsequently well known in the community prior to and at the time of any contractual or other relations, it is sufficient if he is described by that name. The code, while not prohibiting the change of name by custom and use, provides a method whereby such change of name can be affected by judicial decree. In order to obtain such decree a petition is filed in the superior court of the county where the person resides, signed by such person, or in case of a minor by one of the parents or guardian, relative or friend. In this petition birthplace, residence, present name, proposed name and reason for change of name and also the next relatives and their place of residence must be stated. Upon the filing of the petition, the court makes an order directing all persons interested to appear not less than one or more than two months from the date of the order to show cause why such change of name should not be granted. A copy of this order must be printed in a newspaper within the county for four weeks, and thereupon at the date of the hearing the court hears the matter and makes its decree. This procedure apparently is not obligatory but is merely another method.

NATIONAL EGG LAYING CONTEST

By T. W. Noland

Missouri Poultry Experiment Station, Mountain Grove:

The 300 contest hens laid 6,404 eggs during March, or an average of 21.4 eggs per bird.

Pen 54, Rhode Island Whites, Missouri, won the cup by laying 129 eggs during the month.

Ten Leading Pens for March

R. I. Whites, Missouri, 129 eggs; S. C. Reds, Missouri, 126; Barred Rocks, Missouri, 125; Anconas, Missouri, 121; S. C. White Leghorns, Illinois, 121; Barred Rocks, New York, 121; Barred Rocks, Canada, 121; S. C. Reds, Missouri, 121; Black Langshans, Missouri, 121; White Wyandottes, Missouri, 120.

Ten Leading Pens to Date

Barred Rocks, New York, 547 eggs; S. C. Reds, Alabama, 546; S. C. Reds, Missouri, 531; White Wyandottes, Missouri, 520; Buff Orpingtons, Missouri, 512; Columbian Rocks, Missouri, 507; S. C. White Leghorns, England, 494; Barred Rocks, Canada, 477; Buff Orpingtons, Missouri, 471; White Wyandottes, Arkansas, 468.

Five Leading Individuals to Date

Barred Rock, New York, 133 eggs; S. C. Red, Missouri, 131; S. C. Red, Alabama, 129; S. C. Red, Alabama 127; S. C. White Leghorns, England, 125.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST AT SANTA CRUZ

For the week ending April 10 the contest flock as a whole laid 68 per cent. This week saw a new non-stop record completed for the contest when hen No. 198, belonging to Bellows Brothers of Lakeside, failed to lay after laying for 30 days straight. Hen No. 16 finished the week with seven eggs, bringing her count up to 129 eggs for the 147 days that the contest has run. Two pens of Santa Cruz hens won for the week, each with a count of 55 eggs. Following are the high pens for the week: Rose, 55 eggs; Amsbaugh, 55; Bellows Bros., 54; Wood, 53; Enterprise, 52; Walls, 52; Binney, 52; Gibson, 50; Gibson, 50; Wilson, 50; Stalling, 50. All the hens single comb White Leghorns.

Alcohol for Fuel

By John Eastwood

IT is now about ten years since the automobile and motor truck came into general use. Since then their efficiency and the number put into use has outstripped all expectations. Added to this is the development and increasing use of the tractor for farm work and the gas engine on both sea and land.

The consequencc is that while we have been developing the oil industry with marked efficiency and enterprise the consumption has, in a general way, increased faster than the supply, with the result that the price has been constantly advancing until now it is more than double what it was then.

The mere advance in price is not the only bad feature. Where so many and such diverse interests are so absolutely dependent upon one, as is the case with the oil wells today, there is always great danger of the formation of some kind of a combine or trust. In this instance the danger is doubly great because, I believe, the domestic demand greatly exceeds the domestic supply.

This matter was brought very forcibly home to many of our large tractor farmers a short time ago when one of the leading oil companies announced that it would no longer handle distillate. The matter has not, however, assumed an acute stage because other companies have not taken the same step. However, it caused a great deal of discussion as to what fuel to use next, and as many favored kerosene, the following extract from a letter from one of the largest tractor manufacturers in the country may not be out of place:

"I believe we have gone farther than any other manufacturer of a comparatively large tractor, in the matter of the use of kerosene in our motors. We have succeeded in developing our full horse power on this fuel, and from outside appearances only would say that it is satisfactory. The exhaust is clean, and pre-ignition has been eliminated. This, however, is not all that is to be desired.

"The one big trouble with kerosene as a tractor fuel is the fact that a certain amount of this fuel condenses in the cylinders and subsequently finds its way into the crank case. When this occurs, trouble is bound to follow, for when the oil in the crank case is once diluted, lubrication will be seriously affected and the bearings and cylinder walls cannot possibly stand up. They will, of course, stand up for a while, but I would venture to say that any four-cylinder, four-cycle motor now using kerosene for fuel will have serious motor trouble before long."

At that time, the secretary of the Oxnard center of the farm bureau, who has long cherished the idea that the making of industrial alcohol should become a part of the agricultural and horticultural development of the country, took the matter up with Prof. L. A. Moorhouse of the office of farm management and urged that the department of agriculture further such legislation as would allow this industry to be developed in a popular and unhampered way. From this department the matter was referred to Dr. C. O. Townsend, pathologist in charge of sugar plant investigation, with the following result:

"I am glad to have Mr. Eastwood's letter and your statement in regard to his interest in industrial alcohol. I have felt for some time that some effort should be made to manufacture on a commercial scale industrial alcohol especially for farm use. I believe there are many uses to which industrial alcohol could be put that would be helpful and economical. I think sugar beets and sorghum would be a good source from which this material could be made. I shall make further inquiry and if it seems to be worth while, I should be glad to take the matter up with the bureau of chemistry."

There is no reason in the world why this industry does not rightfully belong to the farming community. By what right are they compelled to buy their fuel from some other industries when they cannot only raise it themselves but do so largely as a by-product of or as a booster of other crops?

During the past few years the producing public has had so many occasions to lose what little faith it ever had in the professional politicians that the time seems ripe for the farmers, manufacturers and business men to take an interest in public affairs. They should enter the arena as an active, mobile minority that will choose its men and measures and with the avowed purpose of kicking out as many of the "old gang" as possible.

If the farmers want to manufacture their own power and fuel they can do so. But they won't get it by sitting back and waiting for some "servant of the people" to hand it down to them.

FAVORS NATIONAL HIGHWAYS

Farm sentiment is very strongly in favor of the construction and maintenance of a national system of highways by and under the direction of the federal government, if replies received to a referendum by the American Farm Bureau Federation can be taken as a criterion. The federation is one of the largest farm organizations in the United States, with local federated organizations in 28 states.

Answers to the highway question are still coming in to the office of J. R. Howard, president of the federation, but those received thus far are almost unanimously in favor of a broadened national road policy. Several of the writers express the belief that only through actual governmental participation can a network of highways be built. Many letters express the feeling that once the states and counties are relieved of the burden of aiding in constructioon and maintenance of the main lines which have an interstate importance, the construction of farm to market roads will proceed much more rapidly.

The statement of Senator Charles E. Townsend, chairman of the senate committee on postoffices and post roads, that no further road appropriations should be voted at this session of congress because of the unsettled condition of the treasury and because of the fact that large funds are already available for continued construction, is concurred in by several of the farm bureau officials who hold that further increases should not be undertaken.

MELILOTUS FOR FEED

The article written by Commissioner Waite of Imperial County and in the Cultivator of March 20, has occasioned inquiry as to best method of growing, that is, when was it planted, was it broadcasted or drilled, etc. These queries were referred to Mr. Waite, and he writes:

"The sweet clover was sown broadcast the first of March, 1919, was sown alone on the Huffaker place and in the Bain field wheat was sown with it, furnishing fine early pasture. The general plan of planting sweet clover is the same as for alfalfa. Drilling in moist ground is by far the best method, sowing some wheat or oat with the clover, eight to 12 pounds to about 20 pounds of wheat or oats, depending on the character of the soil and time of planting, using more seed if planted late in the season. If sown by broadcasting, it is advisable to harrow lightly, irrigate and follow with irrigation again in three or four days, in order to keep the soil moist until the seed germinates and comes up before the surface gets dry. Sweet clover is harder seed than alfalfa, therefore keep the soil moist. This is the best method for Imperial Valley."

STRYCHNINE FOR RODENT CONTROL ADVANCES

W. C. Jacobsen, superintendent of rodent control, state department of agriculture, has just received information that the price of powdered alkaloidal strychnine furnished by dealers on the coast in quantities of 300 ounces or more will be $2.05 per ounce in five-ounce tins and $2.10 per ounce in ounce bottles.

This is a considerable increase over the contract price of $1.60 per ounce

which is held by the rodent control division for quantities of 500 ounces or more, provided payment can be assured within thirty days. The state department of agriculture will be unable to carry the counties, as was the case in years past, owing to shortage of funds in the department, and the manufacturers, in setting the remarkably low price for strychnine which we are able to obtain through the courtesy of the U. S. biological survey, have stipulated that payment must be made within 30 days. Any information having direct bearing on the individual counties will be gladly received by the superintendent of rodent control and it may be that arrangements can be perfected for the obtaining of this material.

The last quotation on saccharin was $3.15 per pound, while the price for the coast is $4.25.

Owing to the number of orders that have been received by the manufacturers to date, it will be impossible to make delivery for two or three weeks, and maybe a little longer. It is unfortunate that the rodent control division has not been able to acquire an advance supply in order to ship directly to the commissioners. It might be added that the contract is only for a definite amount of strychnine and the price holds good only until May 31, 1920.

TREE PLANTING ON STATE HIGHWAYS

That uniformity in tree plantings along the state highway may exist and in order that the best trees may be selected for each locality, an agreement to investigate each request for a tree planting permit has been arranged between the California state board of forestry and the highway commission. The cooperation became necessary as the result of a number of requests for permission to plant. Women's clubs and chambers of commerce have taken a lead in tree planting in order to beautify approaches to towns and cities.

The first permit to be issued following the agreement was issued to the Woman's Club of Lodi. The state board of forestry determined Oriental planes to be the best trees for the stretch of highway to be planted and gave instructions for their planting. The permit requires that trees are to be planted immediately on their arrival from the nursery in holes three feet in diameter and two and one-half feet deep. Each tree will be supported by a redwood or cedar stake two inches by two inches by 10 feet, common grade, set two feet in the ground. Each tree must be tied to the stake with manila twine three and six feet from the ground.

The trees are to be planted alternately on both sides of the highway and will be 100 feet apart except where it is necessary to modify the distance to avoid placing a tree near a pole. No trees will be planted closer than ten feet to a pole. The exact location for tree planting will be given by the highway commission and after the trees are planted they will be cared for by the commission. As a result of the agreement between the two state departments, California's highways should in a few years be lined with beautiful trees, planted uniformly, and not in a hit and miss manner. Organizations wishing to plant trees along the state highway can secure information as to how to proceed by addressing California State Board of Forestry or Highway Commission, Sacramento.

AGRICULTURE'S PLACE IN GENERAL EDUCATION

The agriculture of the common school should be educational agriculture rather than agricultural education of a pointed sort. The justification for the inclusion of agriculture in the schools is its emerging as an organized body of knowledge of science representing important fundamental human interests. . . . Regarding method, though the art of agriculture constitutes the permanent educational material furnished by the subject, agriculture is an applied science and the concrete method must be used to illustrate and establish principles and laws. This is expressed in concrete studies of soils in the schoolrooms, in the school garden, on the farm, in railway and road cuttings, and in home gardens, and in the adjustment of treatment to suit the peculiarities of different soils. . . . In other words, the science of agriculture should be taught through real agriculture and horticulture. This view of the subject does away with the deadly memorizing study and also does away with narrow vocational teaching. . . . Agriculture is not yet second nature with teachers, but it must be incorporated in the experience of teachers just as other subjects are, and must find a place in the public schools and high schools, in the normal school, and in summer schools.—Jas. McCaig,

PREVENTABLE FARM FIRES

The annual losses to agriculture through fires will run into millions of dollars. Excluding those of incendiary origin, these fires are in the main preventable.

In view of localized water shortage and the generally dry conditions which will prevail in the absence of further rains, due consideration should be given this fire menace. With livestock, farm implements and hay at the prevailing prices, no farmer can afford a fire!

Establish timely preventive measures on your farm and if fire does break out be prepared to handle it!

EFFICIENT AMERICAN FARMERS

The average American farmer produces nearly three times as much food as any other farmer in the world. We often read that farm land abroad produces three or four times as much per acre as in the United States, and the American farmer is often criticized for this state of affairs. It is true that an acre produces much more abroad, but that is because there are so many more men to work on it. Some 35 per cent of the population of the United States work on farms, and they not only feed themselves and the 65 per cent who live in cities, but most of the world besides.—Boys' Life.

FLORIDA ORANGES

A revised estimate of the 1919-20 citrus crop of Florida was made as of April 1 and indicates the total number of boxes of oranges would be about 6,700,000, and of grapefruit a total of 4,300,000 boxes. Six per cent or 402,000 boxes of oranges and 10 per cent or 430,000 boxes of grapefruit remained on the trees. The total production of the 1918-19 crop was 5,700,000 boxes of oranges and 3,200,000 boxes of grapefruit.

Fortuna Poland China Herd

"The Californian" 358955

A half brother to the two most noted boars of the Poland China breed, the world's champion "The Pilot" and the $40,000 "The Yankee." Individually he is the same type. Best of all he is siring the same type of pigs that made his brothers valuable beyond measure.

Hugh C. Shinn, Tulare, Cal.

We Are Offering for Quick Sale Two Tried Sires

California Jumbo Buster and Blue Valley King

These two boars have sired a class of Poland Chinas that have made it possible for us to secure an ever increasing patronage. Write us at once. We feel sure you will be interested.

A. Buckland & Son, R.F.D., Fresno, Cal.

THE SEQUOIAN

One of the Largest Yearlings in the State, Heads My Herd

He is a young boar of great promise and bids fair to develop into a remarkable sire of big type Polands. Young stock of both sexes for sale at very reasonable prices.

Z. M. Dickey **Dinuba, Cal.**

Trewhitt's Big Type Poland Chinas

have long been noted for their size and feeding qualities and have been bought by the leading breeders of the state for the improvement of their herds. Select your next purchase from a herd where you have the assurance of something better.

W. D. Trewhitt **Hanford, Cal.**

King's Big Bone Leader

is siring the big stretchy type of Poland Chinas sought by the discriminating breeder. He is assisted by Giant Bob 2nd, a son of the late grand champion and a pig of great promise.
Write for information. Stock for sale at all times.

Les McCracken **Ripon, Cal.**

For easy feeding, early maturing Poland Chinas,

Secure the Get of Model Big Fellow

He was Reserve Grand Champion at the last state fair and was next in line to Giant Bob, later sold for the highest price ever paid on the coast. I solicit your correspondence.

J. F. McSwain **Merced, Cal.**

McCune's Quality Herd

of BIG TYPE POLAND CHINAS

attained their prominence by a careful study of blood lines and individuality necessary to real constructive breeding. We produce the type you need in your herd. A few choice individuals for sale at all times.

H. D. McCUNE, **Lemoore, Calif.**

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

CATTLEMEN IN CONVENTION

(Continued from Page 689.)

by the Los Angeles chamber of commerce and presented by W. I. Morrison of the California Alfalfa Growers Association and of the Southern California Poultry Producers Association. Mr. Morrison stated that it was not a question of stockyards or no stockyards, for there certainly would be yards installed in Los Angeles, but it was a question as to whether the stockmen themselves wished to be the power behind or permit the yards to be under control of others. President Bixby took the floor and while he admitted it was probable there would be stockyards installed he did not think the cattlemen were in a position to indorse any such move. His position was supported by Messrs. Jastro and Fuller.

Formal resolutions introduced and passed are as follows:

Be it resolved that the California Cattlemen's Association do unalterably oppose the establishment of union stockyards in the city of Los Angeles or at any other point in the state of California.

Whereas it is recognized by the cattlemen of California that the overgrazing of the ranges is one of the principal causes of the unsatisfactory condition of the beef market of the state, thereby causing half-fat beef coming in competition with the better quality of beef; and this fact causes a great economic waste, therefore be it resolved that the California Cattlemen's Association request the farm bureau of California to use its best influences to overcome this condition, to the ultimate benefit of all concerned.

The resolutions committee consisted of H. A. Jastro, T. H. Ramsay, Howard Jack, A. S. Goode and Harry Jones.

Inspection

As to federal, state, city and other inspections and by reason of said diverse inspections no uniform results are obtained, now therefore be it resolved that the legislative committee of this association take such necessary steps as will be required to bring about the inspection by the state of California of all those engaged in the business of slaughtering and killing of livestock for public consumption in the state of California.

Burning Off Brush

As to burning off brush and its advantage to stockmen, be it resolved that the United States forest service be requested to permit, under proper supervision, the burning off of brush to the end that a greater growth of forage plants may be secured.

L. A. Livestock Show

We hereby endorse the Los Angeles and every other livestock show held within this state and pledge ourselves to do all in our power to further their success.

Humane Association

Thanks of the association were tendered the State Humane Association and congratulations extended for services rendered.

State Dept. of Agriculture Endorsed

We believe such a department will be for the best interests of all of such industries and we heartily approve and commend George H. Hecke, director of agriculture; Dr. J. P. Iverson, chief of animal industry, and Supt. Jos. D. Newsom of cattle protection for their earnest and able efforts in behalf of the cattle industry of California, and we bespeak for these officials the cooperation of all cattlemen of the state.

U. S. D. A.

Whereas the agricultural department serves both the farmers and stockmen of the United States, representing an investment of 80 billions of dollars, with an annual income of 25 billions of dollars, which is half the total taxed valuation of France; and whereas the appropriation now received by the agricultural department is only 35 millions, from which amount, after the forest and other departments receive their portion, the comparatively small sum of 12 millions remains for the farmers and stock raisers; and whereas, taking into consideration the enormous investments and the vital importance to the United States of the farm products, this is a disproportionately small amount and should under no circumstances be reduced; and whereas the agricultural department has saved to the hog raisers alone over 40 millions in one year and has developed the rice industry in California on lands which formerly were worth only from $5 to $10 per acre and are now producing this year 21 millions worth of rice; and whereas through that department cull lemons were worked over into acid, making 1,500,000 pounds of citric acid, 500,000 pounds of citric lime, 50,000 pounds of lime oil; and cull oranges are now being made into jellies and jams to the extent of 600,000 pounds per year; and whereas that department has increased the production of corn 25 per cent, also oats, potatoes and hay, and has increased the production of cotton three and one-half per cent per acre; and whereas in Arizona and New Mexico there is now being produced 20 millions worth of cotton, which is but a small per cent of the good that this department is accomplishing; therefore, be it resolved that the California Cattlemen's Association urge upon congress that there be no decrease in the appropriation for the department of agriculture.

Thanks

Thanks to Zone Five, Chamber of Commerce, people of Los Angeles, speakers, press, officers and others.

Banquet

Roast beef. Toasts eloquent.

AN IMPORTANT SERIES OF HOLSTEIN SALES

It is not too much to say that no state has made as marked progress in the breeding of pure bred Holsteins, in the same length of time as has been registered by breeders in this state. For the past few years the increasing demand for a better class of dairy cattle has been the incentive for the building up of many herds that stand among the top collections of the breed. California Holstein breeders have demonstrated time and time again that all conditions necessary for the production of the very highest class livestock are present here to a high degree. In the development of the Holstein industry in this state the breeders of the black and whites have pointed the way that breeders of other classes of livestock might well afford to follow.

First of all, they have taken hold of the business in a most businesslike way. They have had courage to build their herds on the right sort of foundations and to proceed in the development of their cattle along modern lines.

Aside from the fact that the breeders have been most progressive, they have organized an efficient association for the promotion of the breed and have developed a spirit of good will among themselves that has meant much for the industry. In analyzing some of the reasons for the marked popularity of the breed, the impression cannot be missed that one of the most potent factors has been the development of the public sale method of disposing of their surplus cattle. Indeed, the Holstein interests were the first in this state to utilize the auction method of selling and the successes registered indicate that that method of selling is highly satisfactory to both buyer and seller.

The above thoughts were suggested by reason of the number of high class sales that are scheduled for the near future. During the coming weeks there will be more registered Holsteins sold at public auction than ever have been offered in the same length of time in this state. That fact must not be construed as indicating any sort of liquidation on the part of breeders—it is simply an indication of the growth of the business. There is today a wider, stronger and healthier demand for pure bred Holsteins in this state than ever, and it is a foregone conclusion that all the offering will be quickly absorbed at satisfactory prices.

All the coming sales will be managed by the California Breeders Sales and Pedigree Company of Sacramento, and we were particularly impressed with a statement made in reference to one of the sales, which, by the way, can be applied to all, by C. L. Hughes, manager of the selling organization. Mr. Hughes said:

A. J. Van Cleef Riverdale, Cal.

When writing advertisers, mention the Cultivator.

"No man would sensibly invest his capital and labor in a business that is not fundamentally sound, and the fact that thousands of good business farmers have investigated Holstein-Friesian cattle thoroughly and have then successfully invested in them is in itself a strong testimonial as to the strength and permanency of the business of breeding pure bred registered Holstein-Friesians.

"The great black and white breed has proved itself adaptable to every place on the face of the earth to which representatives of the breed have gone, covering diversities of climate and environment that embrace practically all conditions.

"And the Holstein cow has proven herself a profitable producer whether her product is sold in the form of whole milk, butter or cheese, and under practically all market conditions has a wide lead over cows of any other breed.

"It costs no more to properly raise a pure bred heifer than it does to properly raise a grade heifer, and there is a very great difference in their market value at breeding age, while there is a constantly growing market for every pure bred Holstein bull that is qualified for service.

"Leaving out of the question entirely the tremendous increase in demand for dairy products that is already at hand, and which will inevitably bring about the establisment of thousands of new dairy herds; leaving aside entirely the rapidly growing foreign demand for breeding Holsteins from California herds, we have right here within the borders of this state a market that is almost without limit.

"Approximately one cow out of every 125 dairy cows in the state is a pure bred registered Holstein, and there is no sound reason why at least every other cow in the state should not eventually be a pure bred.

"The practically unlimited market for registered Holstein breeding animals is the basis for sound investment in the business, and in supplying this demand and sharing in the consequent profits every breeder will be rewarded according to the excellence of the cattle which he produces, whether his herd be large or small in numbers."

April 27 and 28, 100 head will be sold at Clearwater by members of the Southern California Holstein Breeders Association. On May 5 the notable Higdon sale will be held at Tulare and will be followed the next day by a consignment sale of 65 head from the leading herds in the Tulare district. On May 8 the Van Blaricon herd will be dispersed at El Monte and on May 12 the Leeman and Kilgore herd will be sold at Ripon.

Ben A. Rhoades of Los Angeles will be on the block in each of the sales and will be assisted at Tulare by Col. George Bell.

All the cattle will be sold on a uniform plan, and all are guaranteed to be breeders.

The time has passed when California dairymen can expect to receive profitable returns on indifferently bred cattle. Better bulls, better cows, better feeding and management and better distribution of dairy products are the basis of successful dairying.

THE DAIRY INDUSTRY FALLING BEHIND

A survey of the dairy situation by many of the states shows that the cow population in this country is not keeping pace with the human population. Such a situation if not averted will sooner or later lead to serious conditions. Milk and its products constitute one-sixth of the human food of the United States. With the output of the dairy industry gradually becoming less per capita, it is quite evident that this situation demands serious attention.

Eminent medical authorities state there is not a sufficient amount of dairy products consumed. They contend that the public should consume $4.40 worth of these commodities out of each $10 spent on food.

Representatives of various breeders' associations in California met last week at the headquarters of the California Cattlemen's Association in San Francisco and decided on a plan for financing a stock show at San Francisco. The breeders asked business men of San Francisco to furnish half the funds necessary.

SAMSON

Heavy Duty Horse Power *for* Draw Bar and Belt.

Horsepower—*plenty of it*—stripped of all unnecessary dead weight! Horsepower for draw bar and belt! At the right price—for both first cost and upkeep! That's what every farmer wants. That is what the designers, engineers and producers had in mind when they developed the SAMSON MODEL M TRACTOR.

You want a tractor that will take the place and perform the duty of a barn full of horses, without costing you a fortune or a big part of your crop to buy and maintain. That is exactly the kind of tractor you get in the SAMSON MODEL M.

It's the last word in modern, down-to-the-minute tractor construction. It is not like the average "I" beam and channel steel frame tractor that weighs so much that it takes a large amount of its power for self-propulsion. It is a close-coupled power unit all by itself from radiator to rear wheels.

Every working part is enclosed and protected against dust, mud or rain. It has no lost motion, for it is built and lubricated throughout like a $3000.00 automobile, insuring great efficiency, ease of operation, maximum length of life and service. The price—the unheard of figure of $840.00—is due to correct designing, engineering and quantity production.

The even distribution of weight, compact unit design, and low center of gravity, give the SAMSON great stability, making it hug the ground and preventing all danger of rearing up and tipping over.

The SAMSON MODEL M is the one tractor you should look at before you buy a tractor of any make or kind. It's not too heavy, it's not too light. It is accessible, easy to operate, dependable and sure.

Booklet Sent FREE!

Ask your dealer for a demonstration of the SAMSON MODEL M or write today for FREE booklet which gives you a comparison in figures showing the cost of maintaining the SAMSON MODEL M compared with horses. You will be surprised at these figures. Horseflesh is an expensive luxury—to say nothing of the chores three times a day, every day in the year, and the drudgery they cause you.

Every farmer should have a copy of this instructive book. Sent FREE!

SAMSON TRACTOR COMPANY, 122 Samson Avenue, **JANESVILLE, WISCONSIN**

Division of General Motors Corporation

Manufacturers of Samson Trucks, Samson Passenger Cars, Samson Tractors and Samson Farm Implements

Here, Mr. Farmer, is the tractor that does not take a fortune to buy or the profits from your farm to maintain

What the Samson Does:

Draw Bar

—will pull a two or three-bottom plow.
—will pull a tandem disc harrow.
—will pull two 20-foot spike-tooth harrows.
—will pull two 4-horse grain drills.
—will pull two 7-foot binders.
—will pull large road grader or do any other heavy-duty, draw-bar job.

Belt Power

—will handle any heavy-duty belt power job.
—will run a 22 to 24-inch grain separator.
—will run a 4 to 6-hole corn sheller.
—will run a heavy buzz saw.
—will run a heavy-duty grinder or ensilage cutter up to 14 inches.
—will run a centrifugal water pump for irrigation purposes.
—will handle stone crusher or large concrete mixer.
—will handle large hay balers and in fact will do any belt power job requiring steady, reliable power within the range of the machine, from morning till night.

Complete with Platform and Fenders, Governor, Power take-off, Brackets for Canopy Top and Regular Cleats.
Price f.o.b. Janesville, Wis., $340.
Price, f. o. b., Stockton, California, for Pacific Coast Delivery, $940.
Prices subject to change without notice.

$940

More Roughage in the Dairy Ration

The feeding value of corn silage, corn fodder and corn stover in the dairy ration is not sufficiently appreciated, especially in those regions where legumes do not thrive, says a specialist of the dairy division, United States department of agriculture. A recent study of records from cow testing associations points to the conclusion that the growing of more corn roughage and less non-leguminous hay would increase the profitableness of the ration.

In all sections where legumes thrive it is, of course, advisable to grow them, as their value is well recognized for feeding dairy cattle. In fact, from a study of cow testing association reports it would seem that even grain does not fully take the place of good legume roughage. It is in those sections where legumes do not thrive, however, that dairymen may well consider the growing of more corn roughage and less non-legume hay.

Cattle Thrive on Corn Alone

Few plants apparently contain all the substances required to nourish properly the animal body, but in the light of present knowledge the corn plant seems to be one of these. It is possible to balance a ration from corn products only that will enable the animals to thrive and reproduce with apparently no ill effects. This is not the case with any other crops. Corn, then, has unusual feeding properties.

Experimental work at the South Carolina and Pennsylvania stations has shown that it is practical under some conditions to feed dairy cows on a ration of corn silage and grain without hay. Such a ration has been used successfully in feeding beef steers. Reports from one cow testing association in a non-leguminous hay region having an unusually high income over cost of feed and large production per cow is in a district where the dairymen have practically discontinued the feeding of hay but instead feed silage and corn fodder. In this association the grain ration is also composed largely of corn by-products.

More Corn Roughage, Less Non-Legume Hay

No matter what other conclusions may be drawn from the evidence available showing the value of corn fodder and corn silage as dairy feeds, it seems certain that the corn plant provides an excellent roughage.

Hay is often damaged very much by becoming overripe. Storms damage it seriously. The feeding value of corn is not damaged by its becoming mature, and if it is properly shocked storms do little damage to it.

There are undoubtedly many dairymen who can well consider the wisdom of reducing the amount of non-leguminous hay produced, of increasing their pasture, and of growing more leguminous feed, corn fodder and silage to feed their dairy cows.

For the fourth time in its history the Roosevelt reservoir is overflowing.

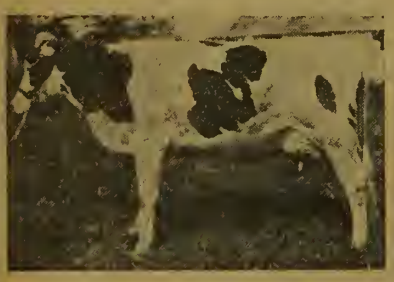
Do You Appreciate This Wonderful Opportunity?

Although never large in numbers, the herd of registered Holsteins owned by W. J. Higdon, Tulare, Calif, has for several years ranked among the very top herds of the breed in the world, a statement that is fully substantiated by the official production records of the Holstein-Friesian Association of America. Not only that but the herd has also stood right up among the leaders in the best show rings of California, and has a record of regular breeding and general good health that is not excelled by any herd in the state.

Now that this outstanding herd is to be dispersed at public sale, have you considered fully the opportunity that you have to secure foundation animals of the very first rank in this sale?

Think for instance of the 20 young daughters of Prince Riverside Walker that will be sold, the oldest milking with first calf, and with an official record above 22 lbs. butter in seven days as a junior two year old. Do you realize that these 20 beautiful heifers are granddaughters of that great producing and breeding cow Aaggie Acme of Riverside, who made 1,054 lbs. butter in one year at 12 years of age, she the dam of Aaggie Acme of Riverside 2nd, whose record of 1,331.78 lbs. butter in one year is the world's official record, she in turn the dam of the sensational heifer Miss Aaggie Acme Burke, who has just made 1,034.44 lbs. butter in one year as a junior two year old with first calf, and 24,338.8 lbs. milk which is a world's record. What a tremendous opportunity these heifers present for a breeder to go on with the blood of world's champions!

King Korndyke Pontiac 20th



THINK AGAIN of the sensational list of six cows and heifers in this sale with official records from 30 to over 36 pounds butter in seven days, bred in the purple, beautiful individuals, and in calf to one of the wonder bulls of today, KING KORNDYKE PONTIAC 20TH!

And Now About King Korndyke Pontiac 20th

KING KORNDYKE PONTIAC 20TH ranks today not only as one of the top bulls of the West, but also as among the very top bulls of the breed. His widespread popularity is due entirely to the unexcelled character of his breeding coupled with his own splendid individuality and proven worth as a sire. No bull that has ever been in service in the West has sired a more promising lot of calves, and his first two daughters to freshen prove abundantly the promise of his inheritance. His value as a sire is limited only by the opportunity that his new owner will give him, and it is an undisputed fact that bulls of his rating are so rare that a search of the entire American continent would uncover very few of his equals, and it is equally true that bulls of lesser quality have been changing hands readily at sums well up in five figures during the past year.

THREE SONS OF KING KORNDYKE PONTIAC 20TH, all out of 30 pound dams will be sold, each one a real herd bull, also a son of Prince Riverside Walker, out of a 32 lb. 3 year old that made over 755 lbs. butter and over 20,000 lbs. milk in one year as a junior two year old. And don't forget that good son of King Korndyke Pontiac out of a daughter of King of the Pontiacs that made 714 lbs. butter in one year as a senior two year old. This will be an offering of REAL HERD BULLS.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

Tulare Sale Pavilion, Tulare, Cal.

Wednesday, May 5, 1920

Everything in Mr. Higdon's herd will be sold except the young daughters of King Korndyke Pontiac 20th, which are being kept as foundation for a future herd. The offering totals.

55 Registered Holstein Cows, Heifers and Bulls

Catalog free on request to management

Auctioneers—Col. Ben A. Rhoades, Los Angeles; Col. Geo. W. Bell, Tulare.

NOTE:—Three of the twenty daughters of Prince Riverside Walker in sale are shown at left.

BUYS SELECT EASTERN SHORTHORNS

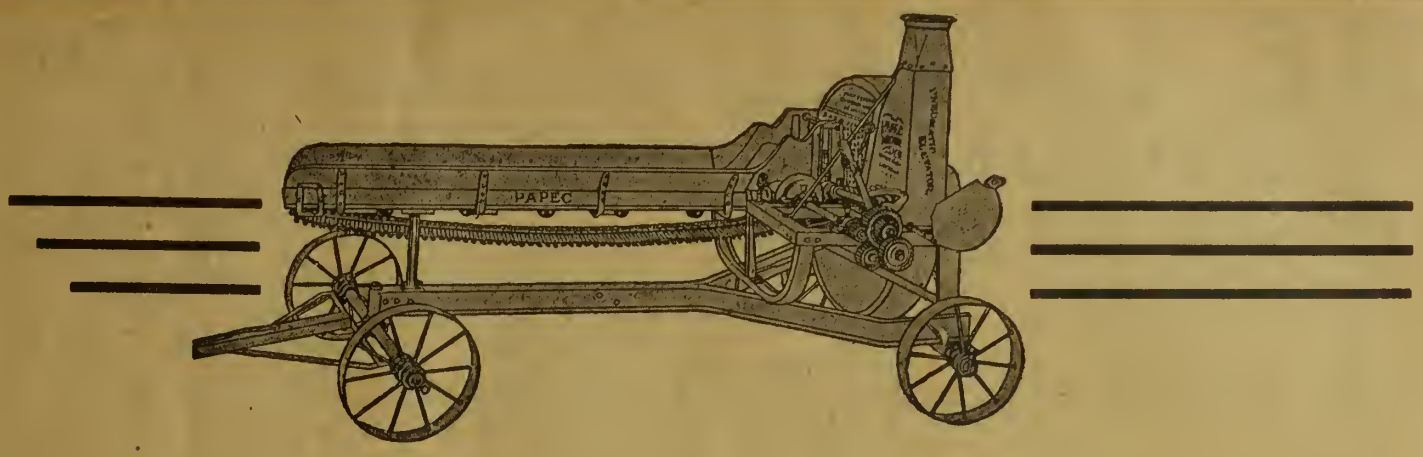
One of the most select shipments of Shorthorn females to enter this state has recently been received at the Ormondale Ranch, Redwood City. The lot includes five head that were selected by Frank W. Harding, secretary of the American Shorthorn Breeders Association. Three head were secured in the R. N. Marshall sale and include Snowball, a white daughter of Bessie's Count and out of Lady Narcissus. She has a roan heifer calf at foot sired by the popular imported bull, Gartly Lansdowne, and is rebred to the same bull. Gartly Lansdowne is generally rated as one of the best bulls in America. He was sired by Proud Wanderer, a bull that was sold for export to the Argentine for $5,000. His dam, Mary Ann of Lancaster 46th, is likewise the dam of Gartly Landseer and the granddam of Gartly Lancer, champion at the 1919 English Royal. Ramsden Queen, by Roan Winner and out of Ramsden Lady, also carries the service of Gartly Lansdowne as does Roan May by Golden King and out of Red May. Two two year old heifers were selected in the Rowland sale. They are Queen Generosity by a roan heifer by Royal Duke, and Orange Lassie by Orangeman. Both are bred, we believe, to Leslie's Royal, a son of Village Star, and regarded as one of the top young bulls of the East. The addition of such choice females to the herd that has but recently secured the imported bull, Boquhan Guinea Stamp, will mean much to the Shorthorn interests of this state. Ormondale Ranch is owned by J. M. MacDonough and is managed by James McDonnell. At one time the ranch was the home of the famous thoroughbred stallion, Ormonde, but of late years attention has been directed toward producing Shorthorns, and it was on this ranch that Little Sweetheart, grand champion at the last International, was born.

BUNTING MAKES IMPORTANT HEREFORD BUY

The Mission Hereform Farm, owned by John A. Bunting, Mission San Jose, has lately received a strong addition to the herd through the purchase of 21 head of females from the Packard herd in Arizona. Among the cows purchased are seven daughters of Beau Tempter, a son of Beau Brummel 10th. Beau Brummel 10th, a son of Beau Brummel, was largely responsible for the success of the Hazlett herd in Kansas. The Beau Tempter cows have great scale, are especially deep fleshed and have attractive fronts. There are three daughters of Perfecto, a son of Publisher; one, and very attractive, is by Don Perfect; one by Sir Simoon 10th; two by Rupert Donald; one by Palomas Erling, a son of Lord Erling; one by Woodford 2d; one by Royal March On, one by Patrician 22d, a grandson of Paragon 12th; one by Gay Lad 31st and one by Odessa Lad 10th. Nearly all the cows had calves at foot that were sired by either Bourbon Columbus or Beau Fairfax.

The above purchase increases the Bunting breeding herd to around 40 head and with the good cattle with which the herd was founded only a few short years ago places the Mission herd in a commanding position in Western Hereford affairs. It is Mr. Bunting's intention to gradually build his herd to around 75 head of breeding cows. A much larger number could be handled as the splendid pastures afford abundant feed but it is planned to handle fewer cattle in order to give them the care it takes to produce really good stock. At present arrangements are being made to send out a show herd to the fall fairs.

Burr Farm reports: We have a letter from R. F. Guerin of Visalia stating that S. V. K. P. Fidessa of Sunnyside has just made in seven days a record of 20.75 pounds of butter as a senior two year old. S. V. K. P. Aaggie of Sunnyside has made in seven days 20.1 pounds of butter and is still gaining. This makes Sir Veeman Korndyke Pontiac, five daughters of over 20 pounds in seven days as two year olds. He has three other daughters on test running over 16 pounds as junior two year olds.



Jack London Owned a PAPEC

The story of Jack London's life is more fascinating than any tale that ever came from his pen. Newsboy, sailor, adventurer in his younger days, he acquired a training that made him one of the foremost American novelists—the ability to judge quickly and accurately.

On his ranch in the Valley of the Moon he owned a Papec Ensilage Cutter. Out of a multitude of ensilage cutters he selected a Papec because, trained to see true value whether it be of man or machine, he was quick to observe the many advantages of the Papec over all other makes of machine.

The solid, semi-steel frame of the Papec that insures durability; the fact that it operates economically on as low as 4 h.p.; the six fans on the cutting wheel which removes all tendency of the cut ensilage to clog in the pipe.

Simplex Silos Are "Scientifically Correct"

These and many other advantages of the Papec made it Jack London's choice. We do not, however, ask you to accept his judgment. See the Papec for yourself. Compare it carefully with any other ensilage cutter you may have in mind. Note that every Papec feature is designed not merely to talk about but to make the cutting of ensilage cheaper and easier for the user.

We really want you to make this comparison. Find out all you can about ensilage cutters, including the Papec, before you buy. If you act upon this suggestion we do not have to urge you to buy a Papec. Your good judgment will do that. We are sure of this because of the great number of Papecs in actual use in California.

DE LAVAL

THE EVERLASTING CREAM SEPARATOR

There are thousands of voluntary letters in the De Laval Company's files, similar to this letter from Mr. Watkinson, of Iowa, bearing out the statements made in connection with the long service of De Laval Cream separators.

In fact, by averaging up the years of use, it has been found that the average life of a De Laval is more than 15 years; and that during that time they have required little attention or repairs, and have produced the highest possible quantity and quality of cream with the least time and effort.

"My De Laval Separator has been in use about seventeen years and is doing just as good work today as when I bought it. I think it is good for ten years longer. With butter-fat at present prices no one can afford to use a cheap machine.

"When looking around to see what kind of a separator to buy I found that all the creameries in our vicinity were using the De Laval. The thought struck me, what is good enough for the creameryman is good enough for me, and my experience proves I made no mistake."

Ed. Watkinson

That is why there are more De Lavals in use than all other makes combined. Sooner or later you will buy a De Laval.

The nearest De Laval agent will be glad to demonstrate a De Laval. If you do not know his name, write to nearest De Laval office

NO SOLUTION

When fat cattle are selling for less per hundred weight than they cost as feeders the old question is sure to be asked, How can we get feeders at prices which will make cattle feeding a safe business? We have no answer to this question. The feeder cattle were bought on the open market and the price was made by competition of feeders with each other and with slaughterers. Philosophers who have no cattle on feed may suggest that such shocks as the business is now suffering are very useful in making feeders more cautious another year, which may be true but is poor consolation to the man who has nothing but a manure pile to show for his corn crop. We have seen several plans to make cattle feeding a safe business every year but have never found one that would work. As long as most feeders must buy their cattle in the fall and sell them before the crops require attention their competition with each other on both ends of the deal will make the business risky. The only way is to feed cattle every year and average the profits and losses, feeding whatever class or kind seems likely to allow a margin. Those who have followed this system have done best, though part of the time they haven't been able to take much pride in the quality of their cattle. Anybody got a better solution of a hard problem?—National Stockman and Farmer.

CALIFORNIA CATTLEMEN'S NOTES

Cattle feeders in California have suffered considerable loss during the last winter. The sudden drop of the market in March, which is usually the highest month of the year, wiped out the profits and left feeders with a deficit to show for their investment, and a winter of worry.

Fred H. Bixby, president of the California Cattlemen's Association, submits figures on an 80 day feeding of 60 head of steers. Mr. Bixby lost $22.63 per head, or a total net loss of $1,355.90. The steers were fed on Mr. Bixby's ranch. The figures speak for themselves.

Bought 60 steers, weighing 54,660 pounds, at 10 cents, $5,446; an average of 908 pounds each; an average cost of $90.80 each.

Feed. 56,700 pounds cut hay at $35 a ton, $992.25; 489 sacks of beet pulp at $45 a ton, $1,100.25; 472 sacks cottonseed meal at $68.87, $1,625.33. Total cost of feed, $3,717.83.

Average cost per head for feed, $61.96.

Sold 60 steers, weighing 69,995 pounds, less 3 per cent shrink, leaving net 67,895 pounds at 11½ cents. Total $7,807.93.

An average of 1,131 pounds each net, or average of $130.13 each; average gain of 223 pounds each; average gain of $39.33 each net.

Cost per head for feed, $61.96; gain per head, $39.33; net loss per head, $22.63.

Net loss on 60 steers, $1,355.90.

The ration for these steers was as follows: Hay (cut), 11.8 pounds per day; beet pulp (dry), 10.2; cottonseed meal, 9.8.

Total cost of feed, 77 cents per day; labor cost, 3 cents. This feed cost is reduced slightly by the value of the fertilizer secured.

GRANDDAD'S COW

The American Milking Shorthorn Breeders Association is issuing a booklet with title, "Granddad's Big Red Durham Cow, a Tale of the Milking Shorthorn." Like the city which couldn't be seen because there were so many houses in it, this is a booklet which cannot be read because there are so many pictures in it. It is almost exclusively made up of illustrations of great producers of both milk and beef. Secretary Roy A. Cook writes that the association now has 825 members in the United States and Canada who are breeders of milking Shorthorns. We believe the book will be mailed to anyone writing for it to Roy A. Cook, Secretary Milking Shorthorn Breeders Association, Independence, Iowa.

For the Prevention of ANTHRAX

Of all livestock diseases, anthrax is one of the most fatal.

For the preventive and curative treatment of anthrax we offer

ANTHRAXOIDS

(Spore Vaccine)

For immunizing cattle, horses, sheep and mules.

Anthraxoids are Anthrax Spore Vaccine in pill form. Each Anthraxoid is a dose ready to be injected under the skin of the animal.

Antianthrax Serum

A serum to be used when animals show symptoms of anthrax.

Anthraxoids-Antianthrax Serum

(Simultaneous Treatment)

Double vaccination with serum and vaccine. Used when anthrax is established or suspected to be in a herd.

Write for free booklet on the Prevention of Anthrax.

FINEST MILK IN THE WORLD

Dr. J. P. Bushong of the department of health of the city of Los Angeles has issued statement as to samples of milk which have been collected from milk dealers in Los Angeles. These samples were taken from the wagon while making the regular rounds, hence gave indication of the character of the milk being delivered. Dr. Bushong says:

"The samples collected during the week were averaged with all other samples obtained during the last four months, and each dairy's milk given a rating on a milk score card adapted by the dairy division of the United States bureau of animal industry.

"This score card allows 100 points for perfect, of which 35 points are for bacterial count, 15 for flavor and odor, 10 points for absence of sediment, 15 for butter fat, 15 points for solids not fat, 5 points for acidity, and 5 points for bottle and cap.

"The dairies are averaged in five classes; certified, guaranteed, pasteurized, raw, goat milk."

The milk from only two dairies is reported on in the certified milk class. This is raw milk produced under the supervision of the medical milk commission. The bacterial limit is 10,000 per c. c. These dairies are Arden with a score of 96.6 and Adohr Stock Farms with 95.8.

In the guaranteed class there were also two dairies. This is raw milk guaranteed by the producer with a written permit from the health commission of the city, the bacteria not to exceed 25,000 per c. c. These two dairies are Elliott Brant Ranch, 95.9 and Los Angeles Creamery, 93.5.

The grade A raw milk was represented by a vastly greater number of dairies, in fact there are an even 50 running above 79.2. Thirty-seven of these dairies produced above 90 per cent milk. These dairies in order of percentage are:

Walter Williams, Liberty Dairy, A. Kravchyk, Archey Dairy, Brandt Dairy, Reynolds dairy, Mt. Washington Dairy, Triangle Dairy, Glen Oak Dairy, Brentwood Dairy, Rose Dairy, H. Davis, Jersey Dairy, Owl Dairy, Miller Dairy, Little Lake Creamery, W. D. McCarger, Fair View Dairy, Lorena Heights. Angelo Dairy, Sawtelle Jersey, Wm. Cobleigh, Hunter Dairy, Shubin Dairy, Arlington Heights, Nielson's Dairy, Hollywood Farms, F. Feito, Meadow Gold Dairy, Southwestern Dairy, Silver Lake Dairy, Four Mile House, Hollywood Dairy, Culver City, Moneta Jersey Dairy, Mizera Dairy, Hobart Ranch Dairy.

Grade A pasteurized milk was largely from creameries with commercial delivery routes, but the markings, all but one, 90 or above, and the highest, 96.2, show that Los Angeles is getting the purest milk of any large city in the world.

Goat milk is classified in Dr. Bushong's report and scored under the same requirements as to bacteria as grade A raw milk.

Report is made from three of the goat dairies. Scottwood Dairy, 95.1; Goat'airy, 94.8, La Corona, 91.7.

MANGE AND LICE IN HOGS

At this time of the year various forms of animal parasites are likely to attack livestock. Lice and mange parasites are generally more active at the end of the winter season when the vitality of the animal is low.

Mange or lice in hogs should not be permitted to go unchecked. Either of these diseases may be overcome by the persistent use of dips. The mange parasite should be dealt with by use of lime and sulphur or arsenical dips, which are familiar to all stockmen. Three or four dippings, six or seven days apart are generally necessary to eradicate mange. Lice can be overcome by dipping with crude oil or some of the coal tar dips. The latter are especially good, due to the fact that coal tar dips are also disinfectants and destroy bacterial life as well.

Some good hog men dip their hogs in the spring of the year to insure getting rid of any skin parasites. The creosote seems to have a beneficial effect upon the skin, giving the hair a glossy and healthy appearance. It is also good policy, when purchasing a few new hogs to add to the drove, to dip them in a coal tar dip, thus eliminating the possibility of carrying infection.

DON'TS FOR GOATMEN

Don't fail to provide shelter to protect them from cold wind, snow and rain.

Don't fail to give them plenty of salt at least twice a week; better yet every day and in such quantities as they will clean up every night. The every day salting will induce them to come to shelter every night, thus protecting them from "varmints" and dogs.

Don't put salt where they can trample it. They will not eat anything unclean.

Don't mix them with cattle, horses or mules. Larger stock is liable to hurt them, especially in small quarters.

Don't let several hundred make a run through a narrow door or gate, to shelter, salt or feed; better have a man with a dog stand near the gate and keep them back.

Don't allow pregnant nannies to browse on green pine needles; it may cause them to abort.

Don't feed grain in large quantities until they have been on short rations for several days. Begin with small quantities, increasing gradually.

Don't fail to dip them for lice at least twice a year.

Don't run over 1,000 head in one flock.

Don't start with inferior stock.

Don't forget that they are brush killers.

Don't overlook the fact that they will soon make old, worn out land fertile.—Angora Journal.

GROW THEM AT HOME

The United States imported every year from 1913 to 1917 nearly $1,000,000 worth of goat skins. This half billion of dollars sent out of the country, almost half of it going to India, should be kept in the United States. But this does not begin to tell the story because government valuations are based on value in countries from which they were exported.

"What Are We Food Producers Going To Do About It?"

A Problem for the Dairyman

IN an article recently published in "The Milk Magazine", Professor Washburn of the University of Minnesota, after discussing the food value of skimmed milk and the large amount of this good human food that fails to reach humanity directly, says:

> *"What are we food producers going to do about it? Continue to waste or invent some better way of using the skimmed milk? Some of it is being well-used on farm-tables, though not by any means as much as should be; some amounts may be used as artificial buttermilk and as cottage cheese, but after all this is done, there still will remain great amounts of the most delicate and useful food with but a poor outlet."*

What This Means To You

THIS pertinent question, asked by a Dairy Expert, through the medium of a Dairy publication, shows that thinking dairymen are beginning to recognize the serious situation—that over one-third of their total output of human food substance is not being utilized as such, and therefore is failing to that extent in benefiting humanity and profiting the dairyman.

Professor Washburn in his article calls skimmed milk "liquid lean meat" because of its likeness to meat in its food value. He then shows that when skimmed milk is fed to stock, only 15 to 20 percent of its food value is returned to humanity in the meat of the animal.

In other words, the dairyman who feeds skimmed milk to stock spends 100% of human food to get back 15 to 20 percent of human food.

Is this good business?

To state it in terms of money—should you spend $100 to get back $15 or $20?

There is but one answer to this question. That is, skimmed milk should be used directly as human food, and a market value established for it as such, if the dairyman is to realize the greatest profit and humanity the greatest benefit from this valuable food.

Skimmed Milk as Human Food

TO do that, a market for skimmed milk as a direct human food must be created. But skimmed milk in its natural state is not a palatable food because of its lack of fat content.

To make it desirable for human use, then, a fat must be restored to it. Obviously butter fat cannot be used. Why not then use a wholesome vegetable fat?

"But that would not restore it to the equal of whole milk in food value", you say. No it would not—but it is not desired to create an article that will compete in the market with whole milk as a direct food.

That brings us, then, to the question of use.

Skimmed milk, with a vegetable fat added, is particularly useful for culinary purposes in the home.

And there you have it. Skimmed milk with a small amount of vegetable fat added would *serve as an auxiliary to the family milk supply for cooking and baking,* and establish a new market for skimmed milk as a human food.

The new food product Hebe, which is composed of evaporated skimmed milk and cocoanut fat, scientifically combined, does just that.

Hebe Points the Way

TO make 100 pounds of Hebe it takes 210 pounds of skimmed milk and 7.8 pounds of cocoanut fat. Thus a small amount of vegetable fat serves as the agent for making a large amount of skimmed milk more desirable and therefore more readily salable as a human food product for cooking purposes.

Hebe thus points the way to utilize as human food the skimmed milk that is now being less profitably used, and it does this without interfering with the established markets for dairy products.

Hebe, then, is an ally to the dairy industry—opening a new and more profitable market to the dairyman for his by-product, skimmed milk—and co-operating in the effort for the increased use of dairy products in the home.

Indirectly, every dairyman profits by that which benefits the industry as a whole. As Hebe volume increases, there naturally will follow the extension of direct benefits.

You will be interested in reading our booklet, "The Missing Third." Ask us to send you a copy. There is no charge for this. Address 2473 Consumers Building, Chicago. The Hebe Company, Chicago and Seattle.

First Sale

Milking Shorthorns

on the Pacific Coast

at

Thomas Harrison's

Santa Rosa Stock Farm

Santa Rosa, California

Sonoma County

Wednesday, May 5, 1920

All registered in American Shorthorn Herd Book. All tuberculin tested.

15 Tried and True Matrons

8 Promising Young Bulls

12 Choicely Bred Heifer Calves

15 Two Year Old Heifers

bred to

Foothills Corporal Count Tickford Foothills Pioneer

Count Tickford is a son of Kelmscott Viscount. Foothills Corporal, the Pacific International Champion, is included in the offering of bulls. He alone would be worth the trip. There will be daughters of the grand champion sires, Foothills Pioneer and Foothills Corporal.

50 HEAD 50

This is the first opportunity for the breeders on the Pacific Coast to secure Miking Shorthorns at public auction. The Harrison Herd has been before the public many years and the enviable record made in the show ring as well as the official records made in milk production stamps this offering as one of unusual merit and should be eagerly sought by those anxious to secure breeding stock suitable for the upbuilding of their herds. J. P. Bennett, representing the Cultivator.

May 5, Thos. Harrison, Santa Rosa.

Duroc-Jerseys

July 21, Elmer Lamb, Ceres.

A big combination sale of Durocs and Hampshires is an event being planned for early summer by the Conejo Ranch.

Up in Glenn County the sheep men have worked out a successful plan for ridding the county of coyotes. Members of the Glenn County Sheep Breeders Association are assessed ten cents per head. The fund thus collected is used to provide an extra bounty on the coyotes killed. The county pays $5 per coyote and the association pays $10. During the past year between 25 and 30 coyotes were killed.

Harvey M. Berglund, Dixon, has had nine Duroc sows farrow a total of 98 pigs, an average that he considers highly satisfactory. Berglund has recently sold to H. H. North, Dixon, the aged Duroc boar, Orion Model. It will be remembered that this boar was used by Elmer Lamb of Ceres and later by the Burr Farm, Orland. Mr. North also selected a mature sow. W. T. S. Hadley of Upper Mattole purchased a boar and a sow pig from the Berglund herd.

The sale of Polled Herefords, scheduled to be held at Fresno, May 5, has been postponed until some time in June. The reason for the postponement was the threatened railroad tie-up making it uncertain that the shipment could be sent from the East.

In a letter just received from W. F. Sandercock, owner of the Natomario herd of Berkshires, Sacramento, he says: "You will be interested in knowing that I have just received a very fine young boar from N. H. Gentry of Sedalia, Missouri. The name of this boar is "Baron Duke 226th" and he is of the same breeding as the national grand champion, Baron Duke 201st, formerly at the head of my herd. Baron Duke 201st pigs are so good I wanted to continue the blood lines, therefore I gave Mr. Gentry an order to select a boar for me that would be a proper successor to Baron Duke 201st. I told Mr. Gentry that I was willing to take a boar that he might select, and I did not put any limit on the price. This boar has the same characteristics as the old boar, heavy loin, wonderful hams, big bone, and George Murphy says that he has lots of feeding quality."

Recent reports from the cornbelt disclose the fact that Williams Brothers, Villisca, Iowa, recently sold their main herd boar The Yankee for $40,000, the highest price ever paid for a big type boar. The Yankee is the sire of Yankee Jr., owned by John Bernstein, Hanford, and like his illustrious sire is stamping his individuality upon his offspring.

M. Bassett and Son, Hanford, have two choice litters from sows bought in the cornbelt during the past winter. One is by Apex, the Halford boar, and the other by The Rainbow. The last named litter are of rather late farrow, but are so typey they court comparison.

W. L. Haag and Son, Hanford, have great faith in the future of their young herd boars, Skyrocket and Lendorris Liberator. Both are making a great growth and will be used to assist Lendorris Liberty Bond and will help maintain the high standing of the herd.

J. P. Walker, Visalia, is very proud of the litter by Ace of Pathfinders and out of Orion's Crimson Lady, the fall yearling gilt he purchased from the Diamond Bar Ranch for $1,500. The pigs have unusual size and stretch and are of the strictly modern type.

A. J. Elliott, Tulare, has one of the largest September boars in the state in Hercules Jr. by Hercules and out of a Mc's Big Orange sow. He is a

half brother to The Giant, one of the best sow sires ever used in the corn-belt. This promising young boar and three litter sisters are Mr. Elliott's lineup for a young herd at the state fair.

Owing to poor health, Elmer Lamb of Ceres has found it necessary to disperse his herd of Duroc-Jersey swine. Wednesday, July 21, is the date selected. At that time he will sell about 75 head, of which 40 will be bred sows and gilts, including Mary Jane Pathfinder, junior champion at Sacramento in 1918, and many other excellent show prospects of various ages.

Stanislaus County is to have a boys' pig feeding contest this season. Through the help of Col. Cy Clark and others this has been made possible. The club at present is to be handled in a small way, only ten boys will be allowed to enter. At the close of the contest the five boys making the best record will be given free trips to Sacramento and Davis.

In announcing the death of Dolly Copeland 42389 at the age of 20 years lacking a few days, the American Aberdeen-Angus Breeders' Association calls attention to the records of the breed in general for longevity and prolificacy. Dolly Copeland, dam of Glenfoil Thick Set 2d, four times an International champion bull, a champion cow and at least one champion steer, died as the result of an accident on the farm of Mike Donohoe, in Iowa, in December when she slipped on the ice and broke her hip. She is the dam of at least 18 calves, possibly 19, never having missed a year without turning in a calf and a good one at that, to pay for her board. The records of the association show 10 calves recorded, but many of the bulls were castrated and shown as steers, especially in the hard times.

Shorthorn cows average 1,146 pounds of milk and 46 pounds of butterfat, an average test of four per cent for the month of February, for the 22 cows making 1,000 pounds of milk or 40 pounds of butterfat, as reported to the Milking Shorthorn secretary, Roy A. Cook. Milking Shorthorn breeders make a profitable yield of milk and a profitable production of beef from their cattle, maintaining a utility type that, while not equaling the special purpose dairy cattle in milk yield, nor the beef alone cattle in beef form, affords a type much in favor with the general farmer.

The number of breeding sows in California on April 1 was estimated by the department of agriculture to be 90 per cent, as compared with April 1, 1919. In the United States the number was 90.1 per cent, as compared with April 1, 1919. Doubtless this decrease can be attributed to a decrease in price of fat hogs and an increase in cost of feed and farm help, thus making the price received by the grower less than the cost of production.

Linn County, Oregon, will hold its county fair at Albany the week of October 4.

A NEW 40 POUND COW

Sadie Gerben Hengerveld De Kol, a purebred, registered Holstein-Friesian cow owned by R. M. Harriman of Wisconsin, has added her name to the honor roll of milk and butterfat producers of remarkable achievement.

This superb cow, according to the preliminary report sent out from the office of the superintendent of Advanced Registry for The Holstein-Friesian Association of America, has been reported to have given under official A. R. O. test in seven days 782 pounds of milk of an average butter fat test of 4.09 per cent. This expressed in terms of butter would equal 40.04 pounds. She was continued on test and reports show her to have produced 3,247.5 pounds of milk, which if converted into butter would make 157.54 pounds.

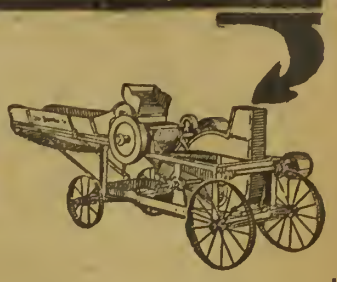
At the time of freshening, January 23, Sadie Gerben Hengerveld De Kol was eight years, two months and 22 days old. This official test began February 5 and was supervised by five different supervisors in addition to Mr. Harris, the superintendent of official testing for the Holstein Association in Wisconsin, who was present part of the time.

Sadie is a large, strong animal, weighing 1,750 pounds, and the only four generation cow in the world, each of which four generations have milked 103 pounds or more of milk in one day, and averaged 106.8 pounds of milk in one day, and 744.3 pounds of milk and 32.43 pounds of butter in seven days.

Sadie Gerben Hengerveld De Kol

Here Is The Alfalfa Cutter You Have Been Looking For

ACME



Silo Filler, Hay Chopper Alfalfa Meal Machine

Try feeding chopped hay this year. Bulk feeding is wasteful. From 10% to 30% (and more in some cases) can be saved by running your hay through an Acme Feed Cutter and blowing it into the barn—an average saving of $6 on every ton you feed.

Chopped hay will feed more cows, takes less barn space than bulk hay, is easier to handle and will all be used as feed—none wasted. The Acme meal attachment produces a finely chopped alfalfa meal that will take the place of the bran ration.

Experienced users prefer the cylinder type for its greater efficiency. Our CUTTER CATALOG tells why the Acme is the BEST of the cylinder types. Send for a copy and sample of Acme-made alfalfa meal.

Southern California Breeders Spring Sale
100 REGISTERED HOLSTEINS
Rhoades and Rhoades Sale Pavilion, Clearwater, Cal. Tuesday and Wednesday, April 27-28

Contributors to Sale:
W. D. MILLARD, Arcadia. (Complete Dispersal).
P. H. KRICK, Anaheim.
AGEE BROS., Rivera.
BURR FARM, Los Angeles.
BOST & JOHNSTONE, Compton.
CHAS. S. HARRINGTON, Corona.
W. T. McALLISTER, Los Angeles.
STALDER BROS., Riverside.

The highest class lot of registered Holsteins ever offered in a consignment sale in Southern California has been the aim of the contributors to this sale.
A feature of the offering is the large number of granddaughters of four of the greatest cows of the breed, Pontiac Clothilde De Kol 2nd, Aralia De Kol, Riverside Sadie De Kol Burke, and Tilly Alcartra, each of which has made from 1,085 lbs. to over 1,300 lbs. butter in one year, each of which has made from 30 to 40 lbs. butter in seven days, each of which has broken one to several world's records. You lay your foundation solidly when you buy this blood.

W. D. Millard Disperses His Herd

The entire high class herd owned by W. D. Millard will be dispersed in this sale, including his royally bred young herd sire KING PAUL KORNDYKE VALE, who is by King Korndyke Sadie Vale, the only son of a 40 lb. cow to sire a 40 lb. daughter. His dam is a 31 lb. daughter of Sir Sadie Cornucopia, one of whose sons sired the only 40 lb. cow that has been reported for more than a year. This bull is worth a fortune to the owner of a high class herd who will give him an opportunity.

Other Consignments Are High Class

Every consigning breeder is putting up good cattle in this sale, in each case some of the very best in the respective herds, and buyers of foundation stock will find in the offering an especially well bred selection, with a wealth of yearly and high short time record breeding, with a spiendid lot of high class females in calf to outstanding bulls.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; NO ANIMAL TUBERCULIN TESTED.

Facts in BLACK & WHITE

Long-lived Purebred Holstein Cows

Leave out of consideration the greater direct cash return and Holsteins are still the best investment you can make. Great strength and constitutional vigor make the typical Holstein long-lived, free from disease and sure to produce many healthy calves. A thirteen-year-old Holstein owned by the Kansas Agricultural College finished a year's record of 15,773 pounds of milk and 513 pounds of butterfat. This record indicates the dollars and cents value of Holstein vitallty.

Feed the Young Things

By R. P. Royce

DURING the present season there will be a larger number of pure bred calves and pigs born on the ranches of this state than in any former year, and in a measure, the success or failure encountered in developing the new crops of young things will largely determine the destiny of many men as breeders.

Without doubt many purchases have been made by beginners who imagine that the production of livestock is pretty much a rule of thumb proposition. It is not.

Generally speaking the greatest single source of failure with initial purchases of registered livestock lies in the inability of the owner to properly develop his own productions or to satisfactorily complete the development of stock purchased young.

Development is largely a matter of feeding and care. It is therefore essential that the beginner thoroughly govern himself in a knowledge of the fundamental requirements for the care of young livestock—and the principal object is growth. Without satisfactory growth one can not hope to compete with those who do grow out their young things.

The inheritance back of our animals, the selected and fixed qualities representing the accumulated work of generations of breeders, furnish the groundwork on which to build. It is for that reason pure bred livestock of all kinds is urged as being more efficient than stock of indifferent breeding. Since the dawn of improved livestock a constant effort has been made to select out and propagate those individuals that seemed to possess in the highest degree qualities that come nearest to meeting the demand of the time, whether meat production, milk production, wool production or work. That the work has been well done is evidenced by the superior examples of our established breeds, but the mistake should not be made of assuming that present day perfection has been accomplished without regard to proper feeding. As a matter of fact it is axiomatic in livestock affairs that every great breeder has been a great feeder. That fact has been true in the past, it is true today and will hold true in the future, and until one realizes the importance of feeding he will do well to stay out of the livestock business.

Time and time again the writer has heard men express disgust with the idea that pure bred livestock is more efficient than the scrub—and they point to their own failures as proof. The evidence they submit is usually an indictment of their own ability rather than their livestock. Nine times out of ten they failed because they had proceeded on the assumption that if it was true that pure bred livestock was more efficient than the scrub, then it should justify the claim by proving that it could develop on less feed than the scrub—when heaven knows the scrub was getting little enough.

Advises Ranchers to Stay in Hog Business

IN a recent letter to the editor, A. D. McCarty, president of the California Swine Breeders' Association, offers some mighty sound reasons why the ranchers of this state should stay in the hog business. Mr. McCarty says:

Practically every man growing livestock has not only had his ear to the ground during the past few months, but he has been trying to read the stars as well to determine what the future has in store for him.

The farmer raising hogs has had to possess a good deal of nerve to stay with the game in the face of high prices for feed and uncertain hog market. It has been my experience that the man who starts in the business when the prices are high and gets out of it when the conditions are not the most favorable is the man that has the most company but not the man who profits most.

I have felt pretty firmly convinced during the past few months, when I hear of everybody cutting down their herds, of farmers selling off their hogs because of high price of feed, that the farmer, and breeder as well, who stays in the game will surely profit in the end. I think it is a well known fact that the farm bureau sales over the state show a rapidly decreasing number of hogs. In localities where they were able to secure four or five cars of hogs for these sales they now have difficulty in securing one or two.

I had a talk with the representative of one of the eastern meat packers today. After he dwelt upon the grief of the packer at some length, explaining that their export market had been cut off; that some cargos on reaching the shores of England were refused and turned back on account of the low exchange rate; that their cellars were stocked with cured pork to supply all their requirements until August 1, he said: "But as a hog raiser, this does not need to worry you, as the price of live hogs on the Chicago market seems to be getting stronger all the time." When I asked him how he explained, if their cellars were full and they did not need pork, why they were paying a higher price for hogs, he replied that their stock on hand consisted of the cured cuts, hams and bacon, principally the latter; that they were finding it difficult now to get enough hogs to supply the cuts for the every day market in this country; and if I have followed the situation carefully that is the only point that the farmer and hog raiser needs to take into consideration. The live pork is not in the country to supply the demand this time next year when we could expect mighty good prices for pork on the hoof.

I have before me a report issued by A. M. Nelson, development agent, Imperial County, El Centro, just issued. It is headed "Increase in Livestock, Crop Acreage, and Property Values in Imperial County." An analysis of this report is most interesting.

The alfalfa acreage has increased from 32,703 in 1910 to 96,040 in 1919. Barley acreage from 43,573 in 1910 to 75,292 in 1919. Milo acreage from 4,327 in 1910 to 67,816 in 1919. Now take these figures in comparison with the following: Number of cattle, increase from 14,063 in 1910 to 72,563 in 1919; sheep, from 14,825 in 1910 to 107,886 in 1919; number of hogs decreased from 34,292 in 1910 to 29,127 in 1919.

The figures also show that in 1918 there were 34,194 hogs in Imperial County as against 34,292 in 1910. The following year 1919 shows a decrease of 5,067. From this report it will be seen that notwithstanding the great increase in the acreage of alfalfa, barley and milo, there has been a remarkable decrease in the number of hogs in the county.

I think close statistics of the other counties of the state would show exactly the same tendency. I feel certain that this reflects the tendency all over the country. My prediction is that within one year the country will be hog hungry, and the man that takes care of the old sow and her litter will receive his reward.

Real Foundation Holsteins

65---Registered Cows, Heifers and Bulls---65

Sale Pavilion, Tulare, Cal., May 6, 1920

This is an offering of dependable, highly bred registered Holsteins of excellent type, many with high records, and sold under the most liberal health guarantees.

THE REFERENCE SIRES ARE A FEATURE

In selecting a foundation female, in addition to her own individual merit it is important to consider the quality of the bull to which she is bred, and the females in this offering are bred to four bulls that would command attention anywhere that the best cattle are sought.

SEGIS PONTIAC ABBEKERK, herd sire for R. C. Sturgeon, is a son of Segis Pontiac De Kol Burke, son of the former world's record cow Riverside Sadie De Kol Burke, and sire of Miss Aaggie Acme Burke, the new world's record yearly milk producer in the junior two year old class. Three of his daughters hold the highest yearly butter records in California as two year olds. The dam is Changeling Tidy Abbekerk Gem, who twice made over 34 lbs. butter in seven days; she's a daughter of the century sire Changeling Butter Boy, out of a 31 lb. daughter of Tidy Abbekerk Prince.

SIR AAGGIE DE KOL ACME 2ND, herd sire for Alex Whaley, is by Sir Aaggie De Kol Acme, son of the world's official yearly butter record cow Aaggie Acme of Riverside 2nd, who is also the dam of the new world's record junior two year old milk producer, Miss Aaggie Acme Burke. The dam is Aralia De Kol 3d, 1,100 lbs. butter in one year, she a daughter of Aralia De Kol, 1,142 lbs. butter in one year. Five of the seven nearest dams of this bull average 1,154 lbs. butter in one year, highest in world for a bull of service age.

KING SADIE VALE IDYL SEGIS, herd sire for R. F. Guerin, is by one of the best sons of King Korndyke Sadie Vale, the only son of a 40 lb. cow to produce a 40 lb. daughter. The dam is K P Idly Segis, 35.61 lbs, butter in seven days as a junior four year old, she by the great King of the Pontiacs out of a daughter of Sir Gelsche Walker Segis.

SIR PIEBE DE KOL SEGIS PONTIAC, herd sire for The Victory Herd, is by the famous bull King Segis Pontiac Count, owned by Senator Hackney in Minnesota. The daughters of King Segis Pontiac Count have broken more than 100 world's records in both long and short time production tests, and his blood is sought wherever good Holsteins are found. The dam of SIR PIEBE DE KOL SEGIS PONTIAC is Piebe De Kol of Shady Nook, with over 25 lbs. butter in seven days and 717.46 lbs. butter from 17,635.2 lbs. milk in one year. She is out of a granddaughter of Homestead Jr. De Kol, and the third dam is also the dam of Dora Thorn Sir Josephine, a bull whose daughters have records up to over 30 lbs. butter in seven days.

RARELY DO YOU FIND IN ONE SALE SO MANY CHOICE FEMALES BRED TO BULLS OF SO GREAT MERIT AS THESE, AND THE OFFSPRING SHOULD MAKE THE VERY BEST OF BREEDING STOCK.

Contributors to Sale:

R. C. STURGEON, Tulare.
R. F. GUERIN, Visalia.
ALEX WHALEY, Tulare.
LES McCRACKEN, Ripon.
THE VICTORY HERD, H. E. Spires, Caruthers.

The sale features the entire milking herd owned by R. C. Sturgeon, who disposes of them only because of the recent sale of his ranch. Just consider the great worth of such animals as these:

MELBA HENGERVELD, 30 lb. daughter of Arcady Pontiac Wayne Hengerveld, bred to Sir Aaggie De Kol Acme 2d.

A 28 POUND DAUGHTER of Arcady Pontiac Wayne Hengerveld, to be fresh before sale.

A 25 POUND DAUGHTER of Arcady Pontiac Wayne Hengerveld, that has a 24 lb. 2 year old daughter. Bred to King Sadie Vale Idyl Segis.

A 24 POUND 3 YEAR OLD granddaughter of Segis Pontiac De Kol Burke, whose two year old daughters hold two state records and one world's record for yearly production. Bred to Segis Pontiac Abbekerk.

A 23 POUND DAUGHTER of Arcady Pontiac Wayne Hengerveld, bred to Segis Poniac Abbekerk.

SEVERAL 18 and 19 POUND COWS AND HEIFERS, bred to high record bulls.

A DAUGHTER OF KING SEGIS ALCARTRA PRILLY, the three times Grand Champion bull, out of a royally bred daughter of the $50,000 bull King Segis Pontiac Alcartra.

A DAUGHTER OF KING KORNDYKE SADIE VALE 27th, out of a 29 lb. dam. Bred to King Sadie Vale Idyl Segis.

A DAUGHTER OF KING KORNDYKE SADIE VALE 27th out of a daughter of Count Segis, bred to King Sadie Idyl Segis.

A DAUGHTER OF KING KORNDYKE SADIE VALE 27th out of a 22 lb. 3 year old daughter of Changeling Butter Boy, second dam a 30 lb. daughter of Tidy Abbekerk Prince that made 985 lbs. butter from over 26,000 lbs. milk in one year.

TWO DAUGHTERS OF SIR AAGGIE DE KOL ACME 2nd, five of whose seven nearest dams average 1154 lbs. butter in one year.

SEVERAL DAUGHTERS OF SEGIS PONTIAC DE KOL LUIT, 32 lb. son of Segis Pontiac De Kol Burke.

SEVERAL DAUGHTERS OF ARALIA DE KOL PONTIAC SALAMBO, whose three nearest dams average 1032.17 lbs. butter and 24,158.2 lbs. milk in one year.

TWO DAUGHTERS OF CREAMCUP FIDESSA CORNUCOPIA LAD, whose dam made 897.09 lbs. butter from 22,751.7 lbs. milk in one year.

TEN OPEN HEIFERS, by 35, 32 and 31 pound sires, and other sires of lesser record dams but of rich breeding.

A GRANDDAUGHTER OF SEGIS PONTIAC DE KOL BURKE, bred to Sir Piebe De Kol Segis Pontiac.

THREE WELL BRED YOUNG FEMALES, all in calf to Sir Piebe De Kol Segis Pontiac.

Only Three Young Bulls In This Sale

This is essentially an offering of high class females, but there are also three well bred young bulls that should find favor with quality buyers. Two of these are sons of Sir Aaggie De Kol Acme 2nd, Alex Whaley's great young herd sire, and the other is a son of King Sadie Vale Idyl Segis, the royally bred bull heading R. F. Guerin's Sunnyside Herd.

THE CATTLE IN THIS OFFERING ARE CHOICE THROUGHOUT. EVERY ONE POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ONE OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

THE PLATFORM OF HORSE SENSE

It is not the purpose of the Horse Association of America to oppose any form of motor power, says Wayne Dinsmore, secretary of the association, who adds that to do so would be both humorous and tragic. The gasoline engine has contributed vitally to every field to which it has been introduced—it will continue to figure in the progress of economic development in every phase of commerce for which it is reasonably and economically feasible.

But in its prominence, the value of horse power is being seriously overlooked, much to the expense of both producer and consumer. The pendulum has swung far beyond the limit of economic service and productivity. As soon as the dust dies down and the costs are reckoned there will be found a happy in-between ground for motor and horse power which will retain the development of the horse and all allied accessory industries for their own peculiar and essential values.

Of equal and intimate familiarity is the high cost of meat producing animals and grains. When these prices soared it was the logical, expected response that farmers and stock breeders should turn their energies to the supplying of the demand for foodstuffs, receiving top notch prices for every grade and quantity which could be produced.

The demand for foodstuffs is as great as ever. As much, if not more, energy must continue to flow in that direction. If a plan can be evolved to decrease the costs of meat and grain raising and of the cost of meat and grain to the consumer, it will take farsighted cooperation and untiring energy to put it through. If the incidental costs attached to the marketing and delivery of not only foodstuffs but of all manufactured commodities can be reduced, so that the reduction can be reflected in the price to the consumer, it will repay every producing and manufacturing interest to separately study its own condition, to find out the real balance of affairs and take advantage of the outcome.

The purpose of the Horse Association of America is to aid in this analysis as it pertains to delivery and transportation problems and to meet the resulting demand for horses and mules. For wherever the test has been made, it has been recognized that for economy in the short haul the horse makes good.

Relying on the authenticity of the impartial survey made by the associated saddlery interests, and accepted by the department of agriculture, which shows conclusively that the market for the horse and mule is on an absolutely sound foundation both as to economy and service for many years to come, the horsemen, the saddlery manufacturers, the hay, grain and feed men, the horseshoe manufacturers and master horseshoers, and the wagon and carriage men, are not only committed to policies of permanency but of enlargement and aggressive production. They are uniting in a request for common sense publicity to go to the users and breeders of horses, that they may rise to the varied demands of the market, and to go to the separate units of the interests mentioned, that they may get in on the cooperative movement and in turn receive their share of the benefit.

Competition and scarcity of man power have pushed the pendulum to the limit of its swing; its return to a sane equilibrium, with a maximum use of everything in its place, has already started. That is why the horse and mule interests are regaining proportionate prominence; that is why the Horse Association of America is receiving immediate and enthusiastic support.

The Climax of Holstein Breeding

Tilly Alcartra, world famous Holstein cow owned by A. W. Morris and Sons, Woodland, and her illustrious young son sired by Carnation King Sylvia, the $106,000 son of May Echo Sylvia. The youngster unites the blood of the two most popular cows of the breed and because of that fact the interest of the entire Holstein fraternity is centered upon his entry in the forthcoming National sale to be held in St. Paul, June 3, 4 and 5. It is expected that this California calf will establish a new record price.—Photo by McCurry.

Two carloads of high grade dairy cattle have been shipped into the Snowflake district of Arizona from the Salt River Valley. There is said to be considerable interest in dry farming in the vicinity of Snowflake and quite a few settlers will begin farming operations this year. This section is within easy shipping distance to the new Cooley lumber camp which is one of the largest and most modern lumber mills in the United States.

DISPERSAL SALE

28 Registered Holsteins

Because he must go East, and will not entrust the care of his choice herd to strango hands, Mr. L. B. Van Blaricon has instructed us to disperse it at public auction on his farm one mile north of

El Monte, California

Saturday, May 8, 1920

This is one of the choicest herds in Southern California. The owner has milked his own cows for the past six years, and tho herd has been tuberculin tested regularly without a reactor for the past three years. The breeding of the herd is most substantial and the sale includes:

A GRANDDAUGHTER OF RAG APPLE KORNDYKE 8TH out of a 21 lb. four year old that made 512.12 lbs. butter in 305 days, second dam the 36 lb. cow Alba Sadie Cornucopia Creetia who made at a previous freshening 866.28 lbs. butter in 338 days.

A 26 POUND 4 YEAR OLD granddaughter of King Segis De Kol Korndyke.

A 25 POUND DAUGHTER of Arcady Cornucopia Johanna Lad.

A DAUGHTER OF JOHANNA McKINLEY SEGIS, 40 lb. son of King Segis.

A 21 POUND 4 YEAR OLD daughter of Woodcroft De Kol Sarcastic Lad.

A DAUGHTER OF A 28 POUND COW, that has three A. R. O. daughters.

SEVERAL 16 TO 19 POUND 2 YEAR OLDS, by good sires and out of highly bred dams.

TEN DAUGHTERS OF KING LYDA PONTIAC, who is by a son of King of the Pontiacs and out of a three-quarter sister to the first 41 pound cow Valdessa Scott 2nd.

If you want to buy clean, high producing, well bred females, in good condition, this sale is well worth a long trip.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL TUBERCULIN TESTED BY A DEPUTY STATE VETERINARIAN.

75 **Registered** DISSOLUTION OF PARTNERSHIP SALE **Holsteins** 75

To dissolve an existing partnership the high class herd of registered Holsteins owned by LEEMAN & KILGORE will be dispersed at public auction on their farm near

Ripon, Cal., Wednesday, May 12, 1920

This herd has been established only a comparatively short time, but has from the beginning been recognized as one of the most attractive in the state, owing to the unusual judgment used in selecting the foundation animals, all of which represent some of the most popular blood lines and high record backing to be found in the West. The following list of females gives something of an index to the quality of the offering:

MISS GELSCHE WALKER KORNDYKE, 32.76 lbs. butter from 708.9 lbs. milk in seven days. As a junior 2 year old she made 687.31 lbs. butter from 15,246 lbs. milk in 348 days. She is by Prince Gelsche Walker out of a 29 lb. daughter of Korndyke Queen De Kol's Prince.

FAYNE SPRING FARM PONTIAC DE KOL, a 26.30 lb. 4 year old daughter of Spring Farm King Pontiac 6th. A beautiful young cow that is a most promising candidate for a very large record.

A 25 POUND DAUGHTER OF SEGIS PONTIAC DE KOL BURKE, out of a 24 lb. three year old daughter of King Mead of Riverside.

A 27 POUND DAUGHTER OF A 28 POUND COW, bred to a grandson of Tilly Alcartra.

A 25 POUND DAUGHTER of De Kol Hengerveld Burke.

A DAUGHTER OF KING MORCO ALCARTRA, out of a dam that made over 1,000 lbs. butter in one year and over 33 lbs. in seven days.

A 24 POUND granddaughter of Sarcastic Legislator.

A 24 POUND THREE YEAR OLD daughter of Karel Vale Cornucopia.

A 22 POUND daughter of Woodcrest Aaggie Jewel Son.

A 22 POUND daughter of Dutchland Hengerveld Sir Gladi.

A 16 POUND 2 YEAR OLD, out of a dam that made 850.33 lbs. butter from 18,712.1 lbs. milk in one year as a senior 3 year old.

A YEARLING DAUGHTER OF KING MEAD OF RIVERSIDE out of a dam that made 634.48 lbs. butter from 14,951.1 lbs. milk in one year as a junior 2 year old, second dam with 828.62 lbs. butter from 19,543.2 lbs. milk in one year.

A YEARLING DAUGHTER OF SEGIS PONTIAC DE KOL BURKE out of a dam that made 801.08 lbs. butter from 16,569.3 lbs. milk in one year.

MANY OTHER HIGH RECORD COWS AND HEIFERS out of good dams and in calf to high record bulls.

An Extraordinary Offering of Bulls

The bulls in this sale are of remarkable breeding, and include a number of real herd headers. Both herd bulls will be sold and they are high class.

The senior sire SIR AAGGIE KORNDYKE ALCARTRA is by Prince Alcartra Korndyke, son of Tilly Alcartra, and out of a dam that made 860.91 lbs. butter from 21,208.5 lbs. milk in one year. The dam is on yearly test again and promises to materially increase her present record.

The junior sire KING GELSCHE WALKER KORNDYKE is by King Morco Alcartra, son of Tilly Alcartra, and out of the great young cow Miss Gelsche Walker Korndyke, 32.67 lbs. butter from 708 lbs. milk in seven days. She also made 687.31 lbs. butter from 15,246 lbs. milk in one year as a junior two year old.

THE YOUNGER BULLS are exceedingly well bred. Write for a complete list of the offering.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER.
EVERY ANIMAL TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

WANTED

I WANT A MAN

A REGULAR MAN!

I am tired trying to get along with inefficient labor. What I want now is a man ambitious, straight-shooting, who knows how to farm, who is honest and not afraid to work or use his head. If I can find such a man, married, of course, who is really capable and familiar with Island farming, I can make him an attractive offer. If you can't fill the bill don't bother to write—but if you can, write Box 913, Sacramento.

Herdsman or Foreman (married) with college training and lifetime experience handling purebred dairy cattle. Will consider change of position, lease or partnership. Familiar with all the fine points of breeding and general dairy farm management. Box 3, California Cultivator.

Wanted—To hear from owner of land for sale. O. K. Hawley, Baldwin, Wisconsin.

Pamphlet tells you all. The WILD & DOMESTIC Turkey Home, R. D. Box 26 A, Hemet, California.

Mammoth Bronze Turkey Eggs — "Gold Nugget" and other prize stock. Flock shows enough wild blood for vigor and fine breeding has added size. NO EGGS sold from other than our own stock. Hints given for feeding and care. Turkeys have range. Guarantee fertility. Prices reasonable. Carrie Andrews, BO-K-HAUNT, Hemet, California.

For Sale — Turkey eggs—Bronze, also Mammoth Bronze, also Thoroughbred Mammoth Bronze Toms. Robinson Turkey Ranch, San Dimas, California.

TREES

For Sale—20,000 Sour Seedlings, year old; 1000 Eureka Lemons, 500 Small W. Navels, Supply Co.'s buds; several hundred Rangpur Limes; the mother tree yields a revenue $20.00 to $40.00 yearly. Fruit sticks tight—like the Valencia—the only Lime that sticks. Get in while they last. $1.50 each; $14.00 100. Budding cloth 70c yd. Cyrus W. Wilhite Citrus Nurseries, Glendora, California.

For Sale—Placentia Perfection and Eureka walnut trees, also Eureka Lemon and Almond trees. These are all high grade stock. Ketscher's Nursery, 1101 E. 4th St., Santa Ana, California. Phone 572WK.

50,000 Florida Sour Orange Seed Bed Trees; 100,000 California Sweet Seedling Seed Bed Trees; Valencias, Eureka Lemons; Supply Co. buds. SOUTHLAND NURSERIES, 1941 East Colorado St., Pasadena, Cal., Phone, Colorado 6352.

For Sale—Washington Navel, and Valencia late orange trees; Marsh Seedless grapefruit and Eureka lemons. Fine large trees, reasonable prices. H. H. Ford, Redlands, California.

Avocado Trees—Mathers' Avocado Nursery. Home of Field Grown Trees. P. O. Box 585, Pasadena. Nursery Phone Colorado 6044.

For Sale—Orange seed bed stock. Nursery Colorado and Huntington Drive, Lamanda Park. Paul B. Magee, R. F. D. 2, Pasadena.

Bishop's Nursery, Highland, California, has Avocado, Citrus, Olives, Rhubarb, Carob Trees, Berry Plants, etc. Write for circular.

Fine Stock Valencia Orange trees, budded Placentia and Eureka Walnuts on black root. A. R. Marshall, 1212 Ross St., Santa Ana, California.

Fine Straight Rooted Florida Sour Seed Bed Stock, 6 to 10 inches high. Kloeckner & Lee, 51 N. Chester, Pasadena, California.

Trees Citrus—Navels, Valencias, Lemons and limes. First class stock from yearlings up. About 10,000 in all, will sell right. W. T. Cole, Springville, Calif.

Place Your Orders Now for all kinds of Citrus Stocks. Butler's Morningside Nursery, Lamanda Park, California.

2 Year Pedigreed Lemons, $1.35; Valencias, $1.50. Seed bed stock. L. A. Tuttle, R. 2, Pasadena.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

For Sale—4 Year Old Manzanillo and Mission olive trees. E. E. Barnes, Highland, California.

SEEDS AND PLANTS

Cotton Seed For Sale—Mebane and Durango seed, ginned from our crops, grown West Side San Joaquin Valley, which gave generous production, grading excellent staple and color. Quantity limited. Shipped in new sacks weighing approximately fifty-five pounds. If ordering less than ton state number of sacks wanted. Should plant approximately twenty pounds per acre. Prices: seven one-half cents per pound; in lots of ten tons or more to one consignee, seven cents per pound. All quotations f. o. b. Southern Pacific Westhaven. Boston Land Company, Westhaven, Fresno County.

For Sale — Millions of Stone Tomato plants, grown on new land, from seed saved by myself and guaranteed. Eggplant, pepper, cabbage, cauliflower, rhubarb and other plants. Write for prices and order early. Ran short last year. Reference: Chamber of Commerce, or any bank or business man in Pomona. L. C. Johnson, 795 West Seventh St., Pomona, California. Phone 2987.

Rhodes Grass—Is making Imperial Valley famous and will make any other section famous, if it is planted, especially if the soil is hard or alkali. Write Imperial Valley Seed House for Literature. El Centro, California.

Dairymen — Hog Raisers — Poultrymen! Plant Diener's Sweet Fodder Sudan. Wonderful yield; sweet, soft, nutritious stems and abundant seed. Write for circular. D. J. Whitney, Exeter, Cal., or Morse Seed Co., San Francisco.

For Sale — Ever-bearing Strawberry plants, Progressive, $1.50 per hundred; Superb, $2 per hundred; postpaid. G. M. Hawley, La Mesa, California.

All Kinds Seeds — Plants and Nursery stock. No. 1 Alfalfa 35c. Sudan 8c and up. Dwarf Milo Maize, Honey Sorghum, Amber Cane. Box 501, Fowler, California.

R*O*S*E*S—$1.50 per doz. Fruit and Ornamental trees, plants, vines, etc. Write for special price list. Kavan Bros. & Currier, San Bernardino, California.

Napier Grass—Strong roots, 25 one dollar; hundred $2.50; thousand $20.00. W. Rubell, 221 N. Catalina Ave., Redondo Beach.

Sweet Potato Plants—Yellow Jersey, $3.50 per 1,000, 75c per 100, f. o. b. E. W. Van Gorder, R. 5, Box 91, Santa Ana, California.

For Sale—About 140 lbs. desert raised alfalfa seed. H. P. Ware, Goffs, San Bernardino Co., California.

Stock Beet Seed—Any variety. Write for prices. Aurora Seed Mill, grower, Stockton, California.

California Wonder Corn for seed at practical prices. James McKee, Riverside, California.

HOGS

Chester Whites for Sale—18 months boar, registered. From Reserve Grand Champion sow State Fair 1918, also 3 young boars and 2 sows 6 months old, sired by above. All young stock can be registered. E. N. Johnson, Fairoaks, Calif.

GOVERNMENT LAND

Millions Acres Free Land in U. S.—Full description and all the information as to how to find them contained in "The Homeseeker," a 100-page book. Send for particulars, or $2 for book direct, The Homeseeker, Dept. M, Los Angeles, California.

Complete Pumping Plant, 15 h.p. Western engine with deep-well double acting AMES pump, pipe, rods, cylinder belt, complete, $950; all guaranteed good shape. Complete Pumping Plant, six h.p. Lambert engine and No. 3 hor. centrifugal pump, complete, $225; or with deep-well plunger pump, cyl., rods and pipe, $300. We'll say it's a bargain. DEMMITT CO., upstairs, 120 N. Main, Los Angeles.

For Sale—Sandusky Tractor and P. & O. 3 Disc Plow. Used for one season. Have quit farming and will sell these implements at right discount. Inquire, Alberhill Coal and Clay Company, 604 Pacific Electric Bldg., Los Angeles.

Avery Tractor—Ten H. P., too large for my place. First $250.00 takes it. Forkner Cultivator, also orchard wagon for sale cheap. Chas. Collier, between Monte Vista & Central Ave., on East Holt, Ontario, Cal. Phone 8593 Pomona.

For Sale — Bean Tractor in first class condition. Used about forty days. Engine has just been overhauled. Price $600.00 cash. J. N. Thille, Santa Paula, California.

For Sale—One 3 inch Bean centrifugal pump, with 30 feet of suction line, elbow and head check valve. Almost new. Cheap. Chas. L. Beltz, Rt. 2, Box 799-A, Santa Cruz, California.

For Sale—2 De Laval Silos, Calf-way milking machine, De Laval separator. James Mills Orchards Corporation, Hamilton City, California.

For Sale—Rumley Ideal Threshing Machine 28x44, also Ann Arbor Power Baler. Inquire 1220 W. 49th St. Phone 26227. Los Angeles.

Agency Discontinued—New floor sample S.25 Samson Sieve Grip Tractor 8 horse draw bar pull at sacrifice. Hickey Bros. Co., Carpinteria, California.

LIVE STOCK

BUTTE CITY RANCH
Shorthorn Cattle, Shropshire Sheep, Berkshire Hogs, Shetland Ponies, Bronze Turkeys, White Plymouth Rocks. Stock for sale at all times. Next sale all breeds, second week in August at ranch. W. P. Dwyer and W. S. Guilford, Box C, Butte City, Glenn County, California.

Blue Hogs—Shipments desired the coming summer should be booked at once. Now shipping spring orders. These hogs are actually blue in color. They are the largest, growthiest and most prolific breeders on earth. Write for information. Mention this paper. The Blue Hog Breeding Co., Wilmington, Massachusetts.

Grape Wild Farm—Berkshires, Guernseys. Big Type Berkshire Boars of serviceable age, sired by Big Leader, greatest son of Grand Leader 2nd, Panama Pacific Grand Champion. A. B. Humphrey, Prop., Escalon, California.

Angora Goats—175 head, all but five or six does from 1 to 5 yrs. old, about 50 kids and more coming; $5.00 per head, with kids thrown in. J. P. Berry, Merced, California.

Carruthers Farms—Live Oak, California. Shorthorn cattle and Berkshire swine of quality and select breeding.

Duroc Hogs and Shropshire Sheep. Pure bred stock for sale at all times. J. J Prendergast, Redlands.

SALESMEN WANTED

Men With Spare Time—Ranchers especially, can find excellent renumerative proposition, salary guarantee, working for an old reliable California company Turn your spare time into cash. Write J H. Yetter, 115 North Broadway, Los Angeles

Salesmen Wanted — Agents in country spare time. Interesting; big profits. Hansen, 542 Kendall Ave., Los Angeles.

PLANT TREES

"Jock, when ye hae naething else to do, ye may be aye sticking in a tree; it will be growing, Jock, when ye're sleeping."

Captain Millard C. Lawson, who has just returned from France, where he served for several months in the Motor Transportation Corps of the A. E. F., spoke very earnestly in a recent interview of the need for American farmers profiting by the methods of the French and Belgian farmers in maintaining their supply of wood and lumber. He stated that in those countries a heavy growth of trees is maintained even in the more thickly populated farming regions. Notwithstanding the fact that the population has been dense in those countries for several centuries many more trees are found than in most sections of the United States which have been but sparsely inhabited for comparatively few years, although they were originally very heavily wooded.

Captain Lawson states that the sooner the American farmer profits by the experience of these European farmers the better it will be for our nation as a whole. He made a strong contrast between the French methods of planting trees in every available spot and that of the United States where our trees are constantly being cut down but comparatively few planted, even on ground which is useless for other purposes than the growing of trees. Consequently the price of wood is constantly increasing and the supply rapidly diminishing.

In France practically every farm, no matter how small, furnishes its entire supply of firewood. The American farmer when in need of a supply of wood, if he is fortunate enough to own a farm on which a few trees are growing, proceeds to cut down a tree. Very seldom does he plant a tree to replace the one cut down. The French or Belgian farmer, on the other hand, rarely cuts down a tree, but obtains his wood from the branches alone. Each year he goes over his trees and carefully cuts off a number of limbs. The selection is made with a great deal of care, so as to leave enough limbs and such as are likely to produce the largest and most desirable growth. Every particle of wood, even down to the smallest twigs, is saved and used for fuel. The limbs that are allowed to remain on the stump naturally grow rapidly since they receive all the food gathered by the large root system which the tree has developed during its life. This sort of pruning causes a large irregularly shaped top or knot from which the new limbs sprout forth.

This practice has been followed for years and it is a common sight, as may be judged from many of the pictures taken in France during the war, to see these old tree stumps which have been permitted to grow for years and years but from which each year there have been removed the limbs which were needed for firewood or other purposes.

Perhaps the United States has not reached a point where it is necessary to practice this intensive growth of wood, although there is little doubt but that the plan would be an excellent and profitable one for many American farmers today.

We have at least reached a point where a tree should be planted for each one cut down, and it would be a still better rule to plant several for each one removed. Unless a plan of this kind is generally adopted and carefully followed it will be only a matter of a few years until many sections will be extremely short of wood for fuel, fence posts and other purposes which French and Belgian farms supply in abundance.

When you stop and think it over doesn't the French method of growing a large amount of wood on a few trees seem the most sensible way? And isn't it foolish to kill off a large root system which a tree has been building up for years, and which will keep growing wood at a very rapid rate if properly managed? Young trees cannot duplicate this root system for years, but will at first draw a large part of their sustenance from the upper soil, whereas the older trees draw a larger percentage of their plant food from deep underground where field crops never reach. Of course, care should be exercised in planting trees to select such as will be of greatest value and cause least interference with nearby crops.—Tractor Farming.

ALL ALIKE

Lady Astor, the American M. P., told in London the other day a story about an anti-suffragist.

"Anti-suffragists are all alike," she said. "Once I was canvassing for signatures to a petition about Lord Milner, the viceroy to India at that time. When I called on Mr. Boggs, the grocer, he read the petition carefully and then said:

"'Who is this here Milner, ma'am?'

"'Our Indian viceroy,' said I.

"'Wot's a viceroy?' said Mr. Boggs.

"'A pro-consul, you know.' And I explained Lord Milner's position in detail.

"Mr. Boggs, satisfied, dipped his pen in the ink; then he looked up anxiously.

"'You're not lettin' the women sign this, are you?' he said.

"'Oh, no, indeed,' said I.

"'That's right,' said Mr. Boggs, as he slowly traced his signature. 'That's right, ma'am. Women don't know nothin' about these things.'"

Turkey Troubles

By Jean A. Koethen

WHY is it that 50 per cent of all the turkeys hatched fail to grow up? Why is it that turkey raising can hardly be classed as a permanent occupation in California? A grows a fine flock of turkeys this year, and tells you he has turkey raising down fine, can raise practically every turkey hatched. Two years later you go out to see what new discoveries he has made, and there isn't a turkey on the place. What is the matter with turkeys, anyway?

To be perfectly frank and honest, I don't know, and I don't believe anybody else does. We say the young turkey is delicate, and that is true enough, but why? We say it is not fully domesticated, and its wild nature makes it the victim of our well-meant attention, and tbat is also true. We explain that a great many foolish people, thinking the turkey a domestic creature like a chicken, have employed the same method, or lack of method, that is generally employed in mating fowls, and that general inbreeding is responsible for the decline and fall of the turkey industry. There are those wbo believe that an infusion of wild blood from time to time is necessary to keep up the vitality of the domesticated turkey, and I shall have more to say about this later, but if it is true, it simply emphasizes the points already made, that the turkey is not fully domesticated, and that there has been too much inbreeding. We can of course, if other excuses fail us, fall back on that current phrase "lack of vitality," but that doesn't take us very far. Even the Rhode Island station, which once thought it knew what was responsible for the untimely deaths of so many little turkeys, admits that it has found no ration it can guarantee, and says, "If you bave been successful with one ration, stick to that and do not experiment."

It is generally conceded that three enemies menace tbe life of every turkey that comes into the world! They are lice, dampness and overfeeding, but tbe greatest of these is overfeeding.

Lice

Now I am going to be perfectly honest and admit that I never saw a louse on a young turkey. Whether this is because I have been careful to keep the hen tbat cared for them free from vermin, or because I did not know what to look for, I cannot say. We are told that a great many turkeys are killed by lice. We are also told tbat if they are on the hen when she hatches, they will attack the poults, and we are also told that the turkey louse is not the yellow louse that lives on tbe body of the domestic hen, but a larger, grey louse, and that it is to be found under the wings of the poult. I do not know how to reconcile these two statements, nor do I understand how a turkey louse could find its way to the body of the young birds if there were no adult turkeys about. However, this is a mere quibble. The facts are, that lice are a real menace to the life of the young turkey, and danger from them should be eliminated by dusting both tbe hen that hatcbes them and the young turkeys themselves. Any good strong louse powder may be used on the hen, but buhach powder is recommended for the poults. Dust them over tbe head and under the wings every week, and you will not need to worry about lice.

Keep Them Dry

There is a general impression that many of the turkeys that die every spring are victims of the fog and damp chilly winds which so frequently prevail in May. Last spring, which was unusually cbilly, seems to have been peculiarly fatal to turkeys, if one may judge of the reports, and such seasons are of too frequent occurrence. It may be the coast climate of California is too damp for turkeys. Certainly they do better in the interior valleys.

When fog and drizzly rains occur, as they so frequently do in the turkey season, the only thing to do is to protect the poults with the utmost care. Keep tbem in a coop where they can be confined while the grass is wet in the morning, and keep the coop in the lee of a high fence or building. Some experts believe the turkey should always be brooded on tbe ground, but others prefer to keep a board floor under their feet. In deciding which metbod to follow we must be guided by the character of the ground. A perfectly dry, sandy soil will not chill any little bird's feet, but adobe is neither so warm nor so dry. The coop should be so tight that it can be kept perfectly dry, and sufficiently large to give the birds comfortable room when they cannot be out.

The first few days poults should be kept in the coop. After about the fourth day, if the weather is good, they may be let out in the middle of the day, but the hen should be kept in the coop, and tbe turkeys shut in after three o'clock or as soon as there is the least chill in the air. The poult displays less intelligence than a chick in running to warm up as soon as it begins to feel chilly, and must be watched more carefully. Better shut the poults in too early in the afternoon than risk chilling by leaving them to come in when tbey are cold.

Keep Them Clean

If the poults are brooded in a coop with a board floor, the droppings, after tbe first week should be removed daily, and every two or three days the floor sbould be wasbed. This is necessary not only to keep mites away from the coop, but also because poults are more easily injured by filth than even chickens. If they are brooded on the ground, the coop should be moved to clean ground at least once a week.

It seems hardly necessary to mention the importance of keeping young turkeys on clean soil. There was a time when the Rhode Island station declared that poults should never be kept on soil on whicb chickens had run within a year. At that time they believed the blackhead germ came from soil which had been polluted by chickens, but this theory has been discarded. Cleanliness is of vital importance, however, for both chicks and poults, but especially for poults, and they should never be allowed to run in the yard with chickens, or anywbere but on fresh green range.

Keep Them Hungry

Some experts believe that the disease which has so long been known as blackhead is really appendicitis. However this may be, we know that it manifests itself first in diarrhoea and a noticeable languor and lack of appetite, that in birds of a week or so old death follows very close upon the first appearance of disease, that in older birds the progress of tbe disease is less rapid, and that the second month is the most critical time. We also know that if a little bird that has died in this way is opened, we shall probably find the liver studded with yellowish white spots. This has led to the application of the general term "liver trouble" to this mysterious disease.

It is now believed that the germ which causes "blackhead" or "appendicitis," "or liver trouble," or whatever you name it, is always present in the intestines of the little turkey, but that it is developed by overfeeding, which quickly brings on indigestion and consequent inflammation of the digestive tract. Whether we understand the nature of the germ or not, there is abundant proof that feeding too much and especially feeding corn is often responsible for its development, and that the greatest care is required to keep from overfeeding. Wbether we adopt the Rhode Island station's method of time feeding, or some method of our own, like hand feeding, it is essential that the little poults be fed neither too often nor too much. Just how much they can stand is an open question, but they must be kept hungry.

Onions and onion tops have long been considered a specific for the prevention of blackhead, and many successful feeders never omit onion in some form from the ration. Others, like the Rhode Island station, believe that any other green is as good as onion.

Another specific is cottage cheese or clabbered milk. It is said that poults can be fed on cottage cheese exclusively and make good growth. The lactic acid of the sour milk is believed to prevent the development of the bacteria just as it does the coccidial bacteria in chickens, and sour milk in some form or other should be before the birds daily. To be sure, some die in spite of it, and otbers live without ever seeing milk, but it is safe and a good feed.

R. I. WHITES TO THE FORE

President Bemis of the Rbode Island White Club of America writes:

Rhode Island Whites have been making records in the egg laying contests of the country since 1914. In 1918 a 291 egg hen was produced in the All-Northwest egg laying contest, at Pullman, Washington. Last year in this same contest they made the best breed average, and at the National egg laying contest at Mountain Grove, Missouri they broke all previous egg records. The two leading pens were Rhode Island Whites, one pen of five birds laying 1217 eggs, or an average of 243.4 eggs. The second pen averaged 233 eggs. The leading pen in the contest, also a Rhode Island White, laid 306 eggs for the year.

Rhode Island Whites in tbe show room are attracting more and more attention each season. This popular belief is backed by one of the strongest specialty clubs in the country.

The 1920 Year Book of the Rbode Island White Club of America has just been issued and may be obtained of the secretary, H. E. Caldwell of Canutillo, Texas. Tbe price is 25 cents. Anyone desiring any information regarding this book should write to the secretary.

Poultry Queries

Conducted by J. A. Koethen

Looks Like Poisoning

My two weeks old chicks are dying, several a day. They act sleepy, draw their heads back and kick, then sleep again and after a few hours die. I feed them white Gyp corn, cracked wheat, chopped green alfalfa and sour milk. Can you give me any advice?—Subscriber, Lemoore.

That drawing back of the neck always indicates poisoning. Is it possible the cbicks bave gotten hold of rat or gopber poison? I have seen chicks die in a similar manner from eating bran that had been spilled in the coop and left to mold. I have read that a few drops of turpentine is sometimes effective but the surest cure is to find what the chicks have eaten that they should not have and see that they do not get it again. Your ration is not good. Baby chicks should have finer grain than Gyp corn, though if they have been started on chick feed they sbould be able to eat it by the time they are two weeks old. Most poultrymen use quite a fine commercial chick feed at first, or else grind one to suit their own ideas. In addition to the whole grain they should have a mash. If you can give them all the sour milk they will eat tbe mash need not contain beef scrap. A mixture of equal parts bran and cornmeal will do very well with the sour milk. You can feed it dry or moisten with the milk. Bran is a very important part of a chick's diet.

Can't Break the Shell

My bens lay eggs with such hard shells that good, healthy looking cbicks pip them but fail to get out. Is this because I am feeding too much oyster shell? Several of my neighbors have lost quite a number that way and I have several out of one hatching.—Subscriber, Bisbop.

You cannot feed too much oyster shell, because the hens will not eat more than they need. If I could tell you with certainty just why chicks grow till pipping time and then fail to get out of tbe shell I should be doing a great public service. In many cases it is because the eggs have been kept too long before incubation began.

Rid your flock of lice —
Make every hen a layer

Lousy poultry *can't* pay. Lice sap the blood and take energy that otherwise would make growth and eggs.

Dr. LeGear's Lice Killer

Sifted directly into the feathers of poultry and added to their dust baths quickly exterminates parasites. It is Dr. LeGear's Prescription, tested in his own poultry yards.

Dr. LeGear's Lice Killer sprinkled on vines or plants when dew is on is also a most effective exterminator of worms and bugs.

NEW BOOK "Care and Treatment of Stock and Poultry." 128 pages. A most comprehensive treatise. Written by Dr. LeGear. Send 10c to us today—we will mail it postpaid.

Dr. LeGear's Poultry Prescription keeps hens healthy insures more eggs and better profits.

Dr. LeGear's Chick Diarrhoea Tablets keeps chicks healthy, regulates bowels and system.

Dr. LeGear's Stock Powders increase milk yield, keeps all live stock sleek and healthy.

Address, JAMES D. YATES, Poultry Judge
R. No. 1, Modesto, Cal.

In others it is because the germ is too weak. Lack of moisture is supposed to have something to do with it when eggs are hatched in incubators, but when they are hatched under hens this is not likely unless the weather is very dry. Keeping the eggs too long and hatching from weak or immature stock are, I believe, the two most common causes.

Dropsy

One of my hens seemed greatly swollen between the keel and pelvic bones. Yesterday we made a tiny hole through the skin and almost a cup of watery fluid dripped out. She eats well and has been laying right along. Please tell me what to do.—Subscriber, Bellevue, Washington.

You did the only thing that could be done. The hen has dropsy, which is incurable, though you may relieve it by letting out the accumulation of fluid and by feeding a light ration with plenty of greens. Better kill her as soon as she stops laying.

Favus

An old Barred Rock hen, the mother of my flock, last year developed a peculiar skin disease. Her body was covered with a kind of rotten scab, and the odor was extremely disagreeable. I killed her and thought that would be the last of it. Now I see three of her daughters are affected. Can you tell me what the disease is and how to treat it?—Subscriber, Modesto.

This is favus, a rather rare disease, and apparently inherited, but easily cured. The only case I ever saw was a pullet I hatched from eggs bought from a breeder miles away. I cured her by rubbing a half and half mixture of lard and sulphur on all the scabby places twice a day for two or three weeks, but did not keep her long enough to find out whether her daughters would inherit a tendency to the disease. All the affected birds should be isolated and kept in a warm, sheltered place while they are being treated because the grease makes them quite susceptible to cold. Do not be discouraged if improvement is slow, but use the mixture liberally twice a day. Feed well, especially green feed. If any of the chicks hatched from these pullets develop the disease it might be well to get rid of them all and begin over. In any case see that the birds that have had it are marked so they will never be used again as breeders.

TIMBER HELPS POOR LAND

Timber is essentially a poor land crop. Steep slopes, poor soil, rocky land, unused corners, gullied and wooded tracts, all these afford opportunities for growing timber profitably. A careful survey of the average farm will reveal a surprising number of spots of this sort which can be utilized to advantage. If they do not already have trees, planting them with the proper varieties will materially increase the value of the land.

Certain kinds of trees, like the locust and the acacias, build up poor soil through the nitrogen gathering bacteria in the root nodules. The soil building power of trees on slopes is a fact which the farmer should not overlook. Steep lands, which have been cleared of timber at much expense, after being cultivated for a few years often become gullied, and the rich lands adjoining are covered with deep deposits of sand. The surest and cheapest method of protecting such slopes is to maintain forests on them.

Small gullies can be stopped up by closely packed brush and tree tops, anchored by stakes if necessary. Large open gullies are checked successfully only by planting over the entire gully basin, supplemented by low brush dams across the larger units of the gully.

GET MORE EGGS

"Lady Victory"
1918 Champion laid 304 eggs in 365 days. Highest official record of any living hen. She laid 25 eggs in Jan., 27 in Feb., 29 in March.

Milkoline will help make your hens lay more eggs.

Feeding Milkoline will make you more money —reduce mortality of your flock— keep flock healthy and less liable to disease.

Increase Poultry Profits
Any poultry raiser can easily double his profits by doubling his egg production. Feeding **Milkoline** with other feed greatly assists assimilation, keeps digestive organs vigorous and is a wonderful appetizer, tonic and bowel regulator. **Milkoline** contains nutritive elements vital to egg production and not found in grain rations.

13,000 More Eggs
Jas. E. Keyes, Petaluma, Calif., says: "After feeding **Milkoline** for eighteen months to 2,500 hens, I find that worms cannot exist in poultry where **Milkoline** is used. I reduced mortality with laying hens 10 per cent. I increased the egg production of my flock **thirteen thousand eggs** in one year. Feeding **Milkoline** to laying hens keeps them in splendid health thereby preventing disease and derangements of all kinds."

Milkoline
has a base of modified buttermilk with essential fats and acids added. **Milkoline** comes in condensed form. Will not mould, rot or sour. Keeps indefinitely in any climate. **Milkoline** is simply "**Good Buttermilk Made Better for Feeding.**" Flies don't bother it.

Lowers Feeding Cost
Many feeders say **Milkoline** lowers feeding cost one-third, because their hens assimilate all feed they eat. Our liberal **Guaranteed 30 Day Trial Offer** enables you to try **Milkoline** at our risk—to prove that it will make you mighty good money.

Prevents Disease
Milkoline is not featured as a cure for anything or a preventative, but due to the acidity in the buttermilk it is a germ destroyer and helps keep poultry healthy, which is the best preventative against disease. **Milkoline** is invaluable as a life saver for baby chicks.

PRICES
These prices are F.O.B. Kansas City or the address of our nearest dealer. Dealers in all parts of the United States.

5 Gal. Keg	$7.50
10 Gal. Keg	12.50
15 Gal. Keg	16.50
32 Gal. Barrel	32.00
55 Gal. Barrel	49.50

Prices on smaller packages given in booklet. Buy in barrel lots—it saves you money.

Only 2c a Gallon
For feeding mix one part of **Milkoline** to 50 parts of water (small feeding 5 tablespoons to gallon of water). Feed either with water or mash feed. **Milkoline** keeps their appetite keen and its action is highly essential to normal egg production. When fed as directed **Milkoline costs only 2c a gallon or less.** Trauhaft & Newman, Lankershim, Calif., say: "We would not go back feeding straight buttermilk at any price."

Guaranteed Trial Offer
we will ship you 1 Gallon for $2.25, **express prepaid.** Take 30 days — feed half to your poultry. If not entirely satisfied simply return unused portion and we will refund every cent you paid us. No charge for portion you have used. **Milkoline** is legally guaranteed to be satisfactory. You are always the judge. We suggest ordering larger quantity — you get the benefit of lower price — you risk nothing — you must be satisfied or we refund every cent you paid us. **Make this test now.** The sooner you begin using **Milkoline** the quicker you will be making money.

The domestic market is weak. Fancy and choice California Japan is offered at 10.75 and 10.50, prompt or May shipment.

BEANS

Jobbing price per cwt.: Small white, 6.15@6.30; large white, 6.20@6.35; cranberry, 6.50@7.00; red Mexican, 7.25@8.80; pink, 6.25@6.40; California Bayo, 9.50@9.75; blackeye, 7.10@7.25; red kidney, 13.00@13.25; lima, 11.00@11.25; Garvanza, 9.00@9.50; Kotenashis (in bond), old crop, 5.25; new crop, 5.75.

Dried Peas—California, 5.25@5.50 per cental for green, recleaned.

HOPS

1919 crop, 85@95 per lb.; older growth, 60@70 per lb.; prices to growers for 1920

HONEY

Demand and movement slow. Cash to producers: Light amber alfalfa, 14@16½; white orange blossom, 16c. Beeswax, 38@40 per lb.

GRAIN

Wheat: The prices are based upon Federal grades and standards at the terminals in San Francisco bay and Los Angeles and are as follows per bushel of 60 pounds:

Hard White—	Per Bus.	Per Cen.
No. 1	$2.20	$3.63 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.13	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51½
Club and Sonora—		
No. 1	$2.16	$3.60
No. 2	2.13	3.50
No. 3	2.00	3.48⅓

The above are minimum prices.

For sacked grain add 4½ cents per bushel to the above prices. Deduction of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.

Oats: Red feed, 3.05@3.15.

Corn: California yellow 3.10@3.15 per cental; Egyptian white 3.50@3.65; milo maize 3.00@3.10.

Barley No. 1 Feed, 3.00@3.10.

HAY

Under date of April. 17, Scott-Magner Receipts past week nominal. 219 tons arrived last Friday, but none of this has been run out of the railroad yards as yet owing to the switchmen's strike and nothing has arrived since. Stocks in this city are fast becoming depleted and as there is practically no hay available for water shipment, all having been used during the period when cars were so scarce, it is a serious question. Most of the hay dealers are practically shut down for want of stock. It is impossible to quote the market prices this week as there has been no market. We therefore are quoting our former prices as they stood before interruption of traffic. Movements from country districts of hay are in the same condition as shipments to San Francisco, the railroad companies refusing to accept any freight except in a very few instances where perishable freight is being handled. The rains during the week have had a most beneficial effect on growing crops and have changed future conditions very materially.

& Miller says:

We quote today wholesale prices in carload lots as appear from dealer's transfers upon the hay market in San Francisco, for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat hay (light 5 wire bales)	38.00@41.00
No. 1 Wheat or Wheat and Oat hay	35.00@38.00
No. 2 Wheat or Wheat and Oat hay	33.00@35.00
Choice Tame Oat hay	37.00@40.00
Other Tame Oat hay	33.00@37.00
Wild Oat hay	Nominal
Barley hay	Nominal
Alfalfa hay	32.00@37.00
Stock hay	29.00@32.00
Oregon Cheat and Oat mixed	29.00@32.00
No. 1 Barley straw, bale	70@1.00

Citrus Markets

Los Angeles, April 21, 1920.

The strike has held back shipments and long prices have prevailed for all fruit under way at beginning of strike. At this writing it is hoped general shipments will begin within a few days. This can not be heavy, however, for there is a serious shortage of cars. Immense number of refrigerator cars has been thrown into the Imperial Valley to handle the cantaloupe crop. Railroads are speeding up the return of empties. There is practically no f. o. b. business. Florida's total output of oranges is about 6,700,000 boxes; of grapefruit, 4,300,000. Florida's 1920-21 crop now promises to be immense.

California lemons are being hit hard by the railway tie up while foreigns are coming in in large quantities but they are commanding only nominal prices.

Shipments

Shipments of citrus fruit to date from Southern California since November 1, 1919: Oranges, 14,404 cars; lemons, 2,786; total, 17,190. To same date last season: Oranges, 16,656; lemons, 3,874; total, 20,530. From Central California this season: Oranges, 4,052; lemons, 281; total, 4,333. To same date last season: Oranges, 2.349; lemons, 251; total, 2,600. From Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

MARKET NOTES

Owing to the continued stagnation of shipping there is no market as yet for any produce though the railroads are accepting some perishabies, subject to shipper's risk.

On the Los Angeles market summer squash has gone up in price 50 per cent during the week for none is grown locally and supply is scarce. All other vegetables, also fruits, are sluggish as the stalls are overstocked with local supply. The only new arrivals are light shipments of Hawaiian pineapples.

E. W. Stillwell reports cabbage crop seriously damaged in Los Angeles and Orange Counties. Excessive seeding, yellowing in fields, and maturing of soft lightweight heads are the principal effects observed. Low prices have further curtailed shipments. Orange County crop is believed cut to a total of 250 to 300 cars, the general movement starting in about ten days. The best stock in Los Angeles is coming from San Fernando Valley. All supplies are showing variable quality and much of it is ordinary. Growers were receiving $25 to $30 per ton prior to the strike.

Imperial Valley celery is developing normally although some damage is reported by recent heavy winds in burning foliage, especially on lighter soils. The first car is expected about May 15.

Recent cold weather and rapid spread of a serious infestation of thrips have injured the Coachella Valley onion crop considerably and local authorities estimate not over 1,300, possibly 1,500, cars will be shipped as compared with a previous estimate of 1,800 cars. Heavy shipments about May 1. Shipments now being made mainly to western markets owing to poor carrying quality.

Asparagus shipping season in the Walnut Grove-Antioch district practically over. Volume slightly heavier than last season.

PROBLEM OF MILK

Due to its deceiving cloak of white, milk contains more sediment per pint than most dairymen believe could possibly exist in ten gallons.

The first question the average dairyman asks when he is shown a sediment disk is "What kind of strainer can I use to remove the dirt from my milk?"

A cotton filter cloth is best; the wire strainer commonly used leaves four times as much sediment as does the cotton cloth. Cheese cloth occupies a middle position according to the number of thicknesses used.

Clean milk isn't a question of how to get the dirt out of the milk, but what can be done to prevent the dirt getting into the milk in the first place. The strainer has yet to be invented that will remove bacteria from milk, and every particle of sediment contains thousands of bacteria.

The following factors are important in producing cleaner milk: Wipe the cow's udder and flanks with a damp cloth before milking. This will prevent a large quantity of dust and dirt from falling into the milk pail. Clipping the long hairs on the flanks, udder and belly will make cleaning much easier and faster.

Have clean, dry corrals. When cows have to lie in a manure pile or wade in muck half way up to their bellies one can't expect to produce clean milk.

The small topped milk pail is another very important factor. Some farmers object to it because of the difficulty of getting the milk on the inside rather than the outside of the pail. A little practice, however, soon overcomes this difficulty.

The milk in an open top pail carries almost twice as much sediment as the milk in a small topped pail.

It is hardly necessary to mention dry hand milking as "wet hand" milking is filthy.

There are other important factors to be considered, as sterile utensils and prompt cooling.

Keep dirt out. Use only clean, sterile strainer cloths and cool immediately and thoroughly.

First class equipment makes the production of cleaner milk much easier. Still, clean milk can be produced even under very unfavorable barn conditions. This depends largely on the man in charge. An expensive up to date barn and equipment does not necessarily mean clean milk, for a careful man might produce much cleaner milk in one far less handy. It only takes a few cans of sour milk to show that a little extra time applied to cuffing off the cows is saving money as well as producing a better, healthier product.—Bulletin 1019, U. S. D. A.

Ormondale Ranch
Shorthorns
Redwood City, Cal.

HERD SIRES

Boquhan Guinea Stamp, the great imported Young Broadhooks bull. Golden Goods Jr, sire of LITTLE SWEETHEART, Grand Champion International Show, Chicago, 1919.

Bulls and heifers for sale.

Duroc-Jersey hogs for sale.

James McDonnell, Supt.

Caledonia Shorthorns

One of the choice collections of the breed
One of the largest herds in America

The name CALEDONIA as applied to Shorthorns now and in the future will stand for the best.

Our herd of breeding cows is conceded to be one of the most valuable and useful to be found in America. The bloodlines are tried and proven an represent a wide selection. Scale, constitution, substance, thick flesh and marked quality are outstanding.

HERD BULLS

To mate with out great breeding matrons we have selected a number of exceptional bulls, the superior of which will be found in no herd that we are familiar with.

IMP. CALEDONIA, is without question one of the greatest bulls imported in recent years.

GAINFORD MATCHLESS, grand champion at the 1919 California International, is one of the greatest sons of Gainford Marquis. He is noted for an unusual combination of scale and quality.

PINE GROVE KING is a proven sire of high rank.

SELECT SULTAN, a grandson of Avondale, promises much.

Start a Small Herd Now

There is no question but that a great opportunity lies in the production of pure bred beef cattle. Already the range men are tunring from grade bulls to pure breds. Hundreds of bulls are shipped into this state every year. They should and will be produced here. To the man who has a small farm or the range operator who plans to raise his own bulls, the breeding of Shorthorns offers a profitable and pleasant business, free from many of the annoyances encountered in other lines.

We are particularly interested in the establishment of small herds and we are in a position to fill the requirements of any man—and at prices that are surprisingly modcrate, considering the quality of Caledonia Shorthorns. Visit our farm and herd any time.

40 Top Young Bulls for Sale

Just now we can offer an exceptionally good lot of young bulls—well bred and of splendid individuality. We are anxious to move them as we have a large calf crop coming on and they are priced accordingly.

Watch for Our Sale Announcement

CALEDONIA FARMS

Farm: West Sacramento, Cal.

Office: 57 Post St., San Francisco

A Promising Youngster
A fine bull calf sired by Prince Walker Cornucopia. His dam is Anokia Lyons Butterboy with record of 22.04 lbs. butter in seven days; 98 lbs. butter from 2,022 lbs of milk in 30 days.

Holstein Bull Calves

With a Future

These calves are from the most popular blood lines of the Holstein family. A number of them are from females such as Anokia Lyons Butterboy and Anokia Pontiac Beets 2nd, who are now on semi official tests and promise to make enviable records. Wonderful opportunities await buyers of these bull calves.

Treatment of American Foul Brood

THIS method of treating foul brood is given by J. W. George, formerly bee inspector of Imperial County, in the Western Honey Bee.

* * *

By J. W. George

1. Take plenty of time to get your colony in actual condition to treat.

2. Unless shaking a whole apiary, never shake more than three or four colonies at any one time.

3. Preparation: During the middle of the day, while warm and the bees are flying freely and honey is coming in, remove all frames containing honey, empty combs, and combs with brood, except one comb containing brood and honey, placing same in the center of hive, placing lid on so no bee can either get in or out except through entrance, which should be contracted to one or two inches, with a strip of queen excluder zinc placed across entrance, so it will be impossible for queen to get out and thereby prevent absconding. Loosen bottom board so hive can be removed from same without jarring, and leave it undisturbed until the following evening, just before dark, after the bees in the apiary have quit flying.

4. When preparing colony to shake, all frames should be handled rapidly and placed in an empty hive body and kept covered with cloth, so no other bees can get at them; all dry combs should be melted before shaking any colonies, and all frames containing either honey or brood should be burned, and never melted, only when absolutely dry.

5. All weak colonies should be united with others until they are sufficiently strong to shake and build up afterward.

6. When your colony is ready to be treated, the following day after you have prepared them, if your hive is in a row with other hives in the apiary, with an entrance of very much the same appearance, close up absolutely the entrance of every hive on both sides of the hive being treated, for three or four hives each way. Now, without creating any commotion, gently set your colony which is to be treated to one side; place a clean bottom board and a clean hive where the one to be treated had been setting, containing not less than three nor more than five frames, with full sheets of foundation, placed against one side of the hive, the number of frames depending on the strength of the colony. Additional frames can be added as they may be required. New hive must have entrance contracted fully as much as was the old one, with queen excluder zinc attached. Now this is the critical moment. Gently but quickly lift the old hive from bottom board and set it upon the new hive. Remove the lid from the old hive, lift the one comb with all bees thereon and shake the bees which are on same into the bottom of new hive. Remove old hive quickly and place a clean and tight fitting lid on new hive, jarring the bees from sides of old hive immediately in front of new hive. A few minutes after shaking the colony, with flaming torch burn every bee that is trying to gain entrance to the hives that were stopped up, on either side of the one that had been treated. After being sure that all bees have been burned that were trying to enter the closed hives, the hives may be opened.

7. If there is no honey coming in, it will be necessary to feed colonies that have been treated. Do not feed honey from any source. Make a syrup of equal parts of granulated sugar and water. Feed not earlier than 24 hours after shaking. Following the instructions in paragraph 6, use as little smoke as you can possibly get on with.

The first thing to be borne in mind is that American foul brood is very contagious. The manner of transmitting the disease is through the honey that is fed the larvae or young bees.

The next thing is to be very careful in the handling of anything that would scatter the contagion. A great deal of the scattering of foul brood is brought about by the beekeeper who carelessly handles bees, combs and other parts of the hives.

Busy Month for Beekeepers

Here is some good advice from Farm Adviser H. J. Baade of Napa County as to care of bees:

The honey is coming in and there is no longer danger of the bees "balling" out their queen, which is the real danger if you open up the hive too early, and also with the risk of killing the young brood.

Good colonies are now ready for the first super, those colonies not so strong in numbers will be ready a little later. Don't make the mistake of putting on the super too early, because the heat of the bees will rise into the empty super and then if a cold night comes some of the brood may be chilled, with the result that the colony may be set back several weeks.

When to Put on Supers

There is no particular date on which to put on the supers. The time to do it is when the bees are ready for them, just before they begin to feel short of room. On a warm day when honey is coming in, pry up the cover about a quarter of an inch, blowing a few puffs of smoke across the top of the frame, then remove the cover and look in. If the bees cover all the frame, or all but one, they are ready for the super.

Foul brood is more likely to show up during March and April than at any other time in the year; they are also more easily cured now than later.

Watch the Disease

If you have good Italian stock, you are not likely to be troubled with European foul brood, but if your bees are black, they are very liable to contract the disease, if there is any in your neighborhood. Therefore be on the lookout, that is, if you are able to recognize the disease; if not, call in some one who is and have a careful examination made. This may save you much disappointment later in the year.

Don't trust too much to outside appearance. A colony may appear strong and trusty, and yet have foul brood developing rapidly.

Have you made preparations for swarms? Have you your supers ready? Have you three supers with sections and foundations all fixed, for all colonies that came through the winter? You will probably need them, and bear in mind the bees won't wait. They want what they want, when they want it.

A BEE NOTE

Be sure all your colonies have plenty of stores from now until honey flow comes. More are lost now than during all of the past winter months. Order your bee supplies early so as to have them ready for season when it arrives. A delay of ten days in the honey season may mean the loss of the crop.

Examine all hives; some bees may have died during the winter months, in which case bee moths soon attack the combs. Put combs in strong colonies for protection as they are worth $3 for a set of ten combs. Another plan is to stack and treat with carbon bisulphide, two tablespoonfuls to a super.

Seed dealers in the Salt River Valley of Arizona report that the sale of seeds this year is less than common. And this is taken to be an indication that there will be a shortage of vegetables grown in this section this season. The acreage of cantaloupes will be very nearly as great as last year. The acreage in potatoes has fallen off considerably. The acreage in cotton will be about 150,000, an increase of approximately 60,000 acres. It is reported that the alfalfa acreage has not been decreased as much as was feared. The increased acreage of cotton will be largely at the expense of the grain crop and other crops than alfalfa. Cotton seed sufficient to plant 20,000 acres has been shipped from the Salt River Valley to the Imperial Valley.

Household Department

WAITIN' AT THE STATION

Waitin' at the station. Ain't it awful? Yes.
Train crew off a strikin', service in a mess.
Station filled with people, piles of luggage, too;
Wan-faced, tired women, men a feelin' blue.
Patient information clerks standin' in their places.
Tryin' to rub the question marks out of people's faces—
Worried people achin', anxious to depart,
Oh, you, Mister Striker, please do have a heart.
Waitin' at the station. Ain't it jolly? Sure.
Human bein's findin' out how much they can endure.
Children rompin' round the place like they was to home,
Poet sittin' on her foot an' scribblin' a "pome;"
Hungry kids a crammin' down cookies, fruit an' candy,
An wipin' fingers on yer skirt—only towel handy;
Tired kids a'sleepin', on the benches sprawled,
Waitin' at the station fer the train that isn't called.
Waitin' at the station—optimistic—Gee!
Thousands miles an miles away from where they want to be:
Hear the babies laughin', see the mothers smile,
Hear the daddies jokin,' "We'll git there after while."
See that helpless invalid in her old wheel chair—
An' would you believe it, she's the jolliest creature there!
See the ladies tattin' an' writin' letters home,
An' now the poet's finished an' is sealin' up her "pome."
And if she don't git out o'here another she will start—
An' send it to the editor. Oh, striker! have a heart!

—Isabelle Graham.

A HEART OF GOLD

NCE upon a time a young wood chopper lived with his mother and younger brothers at the edge of a great forest. He was only a lad, but upon his shoulders rested the cares of the large family, for his widowed mother had been sick a long time. Every day he went into the forest to cut fagots, which he sold in order to buy food. As the weeks went by, the lad, worn out with work and worry, became more and more down hearted. Finally, as he waded in the mud and mire under the dense trees, he cried out in despair:

"Life is not worth the living in all this mud and gloom. There is nothing beautiful in the whole world."

To his surprise a voice answered him. A tiny voice it was, but as clear as a bell: "Do not be discouraged," it said, "there are many beautiful things in the world. Look at me. Am I not beautiful?"

The lad looked all around and above him before he caught sight of a dainty little fairy perched on the sleeve of his blouse. She was no larger than a butterfly, but lovely with the loveliness of a brilliant diamond. Her golden hair was as soft and as silky as a cob veb, her eyes shone like tiny stars; and all about her floated a thin drapery that resembled a purple mist. The lad stared at her in wonder.

"Indeed, you are beautiful, but I had not seen you," he said.

"You were not looking for beauty," the fairy replied, "or you would have seen that pure white water lily growing there in the pool. It came from the mud and slime, yet it managed to keep pure and spotless."

The tiny fairy flew to the flower and held back one of the long petals. "See," she said, "inside is a heart of gold."

Long after the fairy had gone the lad stood by the pool thinking. "A heart of gold, a heart of gold," he said to himself over and over again. "A heart of gold would be a true heart, a brave heart that would not grow discouraged." Then he resolved that he, too, would have a heart of gold. He set to work with a will, and when he had finished he broke the stem of the lily and carried it home to his mother. He put it in a rude vase and placed it at the foot of her bed. Soon the feverish eyes of the sick woman found it, and resting there she seemed to find peace and comfort in its purity. The flush gradually left her cheek, and in a short time she was sleeping quietly. The lad felt that she would soon be better. He quietly straightened up the house the best he could, and made himself clean before taking his wood to the village.

The next day when the lad went into the forest, he saw the fairy again. "I am going to have a heart of gold," he told her.

"Yes," she said, "and that is good, but you must have a singing heart as well. See that little goldfinch with the broken wing? He would rather be in the tree tops where there is sunshine, but since that is impossible he sings away just the same." The fairy pointed to a bright yellow and black bird which stood on a log whistling bravely, even if one little wing did touch the ground.

"I will take it home with me and mend its wing," the lad said. And he placed it on top of his pile of wood.

All the way home the bird whistled merrily and the lad, following every trill, learned to whistle almost as well. The younger brothers stopped their quarreling and ran to meet him.

"Where did you learn to whistle like that?" they asked.

"The bird with the singing heart taught me," answered the lad.

"Will you teach us to whistle?" the brothers then asked.

"Certainly I will, if you will help me cut wood tomorrow."

The brothers eagerly said they would, and watched while the lad bound the bird's broken wing. When this was finished and the bird had been given water and crumbs, it was placed on the window ledge where the sick mother could see it and hear its song.

The next day the five younger brothers went to the forest with the lad, and they all whistled as they worked. By night they had all the wood to sell that they could possibly get to the village. And with the extra money they bought several hens to lay fresh eggs for the mother to eat. In a short time she was able to sit up.

"It is my brave lad and my whistling boys that is making me well," she said.

The boys all worked together every day after that, and prosperity began to smile on the little cottage by the forest. The lad told his brothers about the fairy, but none of them ever saw her again. The bird flew away when its wing was strong and the lily withered when the mother was able to be up, but the lesson of the golden and singing heart was never forgotten.—M. J. T. in Successful Farming.

HOUSE BRIGHTENING HINTS FROM CHICAGO SUBSCRIBER

Do you ever consider how much of decorative value you have put away with your best dishes? If life is too prosaic and strenuous to use them every day we could at least enjoy seeing them. For that matter, let us try in each room in the house to see what good results may be attained by a pleasing arrangement of the household articles pertaining to the use of that room.

Some dining rooms have been wonderfully rejuvenated by taking out every one of the accumulated pictures, calendars, magazines and work baskets and substituting on the cleared-off shelf a row of bowls or pitchers or grandmother's blue platter, flanked by a couple of brass or copper pieces.

The writer once unearthed an old whale oil lamp in a widower's carriage shed and persuaded him to reinstate it, fitted with an electric bulb, on his living room table and keep his implement catalogues there instead of in the kitchen, and before the year was out he married the art teacher in the public schools.

Custom so dulls our eyes to the appearance of our own possessions that we fail to notice the beauty of the beautiful or the ugliness of the ugly, and for that reason it is well not to be too conservative when the keen minds of the growing daughters of the house begin to criticise and the girls beg for a change. I know a clever woman who had a closet under the stairs where she put furniture convicts under arrest. It was known in the family as Botany Bay. That is a conundrum and you may ask the history scholars for the answer.

There are possibilities in the overflowing work basket, too. Do not try to hide it behind the sofa. Publicity will do it as much good as it did the peace treaty. A sorted-out work basket where one can assuredly find needles, pins, tape, thread, scissors

Dye Old, Faded
Dress Material

"Diamond Dyes" Make Shabby Apparel Stylish and New—So Easy Too.

Don't worry about perfect results. Use "Diamond Dyes," guaranteed to give a new, rich, fadeless color to any fabric, whether wool, silk, linen, cotton or mixed goods,—dresses, blouses, stockings, skirts, children's coats, draperies,—everything!

A Direction Book is in package.

To match any material, have dealer show you *"Diamond Dye"* Color Card.

Save 1-2 on Fuel

CHEAPEST HEAT YOU CAN BUY

The Sievert Oil Burner burns either distillate or kerosene oil in cook stoves, heaters, furnaces, pasteurizers, boilers, prune dippers, dairy sterilizers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes. Address Sievert Oil Burner Co., 710 North Main St., Los Angeles.

DAISY FLY KILLER

PLACED ANYWHERE ATTRACTS AND KILLS ALL FLIES. Neat, clean, ornamental, convenient, cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed affective. Sold by dealers, or 5 by EXPRESS, prepaid, $1.25.

HAROLD SOMERS, 160 De Kalb Ave., Brooklyn, N. Y.

and plain buttons and nothing else gives more of a look of repose to the living room than an elaborate sofa pillow that cost hours of effort.

But where to put the overflow. Well, here is something one girl made for her mother, which has stood the test of time. A wooden cheese crate from the grocer's was mounted on four legs and painted flat black. The inside was lined with gay cretonne like the window curtains and hanging outside of the box at each of four sides was a bag of the cretonne, each drawn up with a different colored ribbon. The bags were to sort the unfinished work and could be quickly identified and carried away when leisure moments came for hand sewing.

FOR THE CHILDREN

By Martha

Help the little ones to develop into strong men and women by providing each its own small bed.

Scientific men say that honey is a much more healthful sweet for children than sugar. It needs no digestion as sugar does and even acts as a digestive aid.

When a child has bow legs, rub the outside of the legs from the ankle up toward the knee with hot salt water each night and morning for at least ten minutes. This strengthens the weak muscles of the leg.

When a child has croupy cough, take a piece of alum, powder it and put in one tablespoon of sweet milk and have the child swallow it. This will cause it to vomit at once and then the trouble is over.

For thrush, throat and mouth affections in children, paint the affected parts night and morning with borated glycerine, and use this for small cuts, burns, bruises and all irritations of the skin. This lotion is made with five parts by weight of boric powder to ten parts of glycerine, and this must be warmed and stirred until the powder is dissolved. This makes one of the best washes for sore or inflamed eyes.

An excellent and cheap toilet powder for children is made with three parts cornstarch to one part boric powder with a few drops of perfume added but when a child is very chafed and sore the powder is used alone.

One really owes it to a child to give him a fair start in good table manners, and when once learned and followed for a time, correct deportment at table, as elsewhere, becomes a habit, one which may save its possessor considerable mortification at various periods through life.

INEXPENSIVE AND SATISFYING

Hungarian Goulash

A little left-over cooked meat may be the basis of this delicious. well flavored goulash: Two cups cooked meat, three carrots, three potatoes, one can tomatoes (one pint), one teaspoon chopped green chile, one onion, one small bay leaf, one and one-half teaspoons salt, one-fourth teaspoon pepper, two tablespoons fat, five tablespoons flour.

Cut carrots and potatoes in thin slices, cook in boiling salted water till tender and drain. Cook tomatoes, chile, sliced onion and bay leaf five minutes and remove bay leaf. Melt fat, add flour, salt, pepper, tomatoes and one cup water and bring to boiling point. Add vegetables and meat cut in pieces and serve when thoroughly heated.

Stuffed Beef Heart

One beef heart, two cups soft crumbs, one tablespoon fat, one teaspoon salt, one small onion, one-fourth teaspoon pepper, one-fourth teaspoon sage, one cup ripe olives.

Remove arteries, veins and fat from the heart. Mix crumbs, melted fat, finely chopped onion, sage, and stoned and chopped olives. Moisten with enough hot water to hold together. Stuff heart and sew up the opening in such a way that stuffing can not cook out. Sprinkle with flour and brown in little hot fat in frying pan. Put into kettle, cover with boiling water and boil 15 minutes. Then cover and cook below boiling point till tender. Serve with a gravy made by thickening stock. This is delicious cold as well as hot. Cut in thin slices and serve with tomato catsup. It is an excellent substitute for the more expensive cuts of beef.

Spinach Loaf

One-half tablespoon fat, one tablespoon flour, one-half teaspoon salt, one-half cup milk, one-half cup grated cheese, one can spinach, one cup crumbs, one tablespoon lemon juice, one egg.

Drain and chop the spinach. Melt the fat, add the flour, salt and milk and stir till it boils. Add the cheese, spinach, crumbs, lemon and beaten egg. Pour into a greased baking dish and bake 30 minutes. Serve with tomato sauce.

Chile Beans

One can baked beans, one small onion, one tablespoon brown sugar, one tablespoon chopped green chile pepper, one can tomato sauce.

Chop the onion very fine and mix with beans, chile pepper and tomato sauce. Pour into a greased baking dish and sprinkle the brown sugar over the top. Bake 30 minutes.

THE STORY OF "TRAMP"

He was just a stray dog when he came one night to the house of some kind people who took him in. Later they had to move away but they got him a home with his present owners. He had been called "Tramp," which is not a very good name for a dog who has a home. He is of no particular breed, a little bulldog, a little of everything else, in fact, he is just plain dog, but everyone who loves dogs knows that it isn't the breed, but the dog that counts.

From the very first he liked to be close by the baby and would sit for hours beside the cradle where she slept, and when she was taken out for a ride, Tramp walked sedately beside the little carriage.

One morning both master and mistress went away to do some errands, leaving the baby asleep in its bed, the two older children playing near by, and, of course, Tramp on guard as usual. Suddenly the two older children, both under seven, saw flames at the head of the stairs, and in another moment the whole upper floor was on fire. They screamed and ran out of the house and the neighbors, hearing their cries, came running into the yard. They reached there just in time to see Tramp dragging the baby by its clothing. He came out the back door, then he crossed the yard and dropped the child into a snowbank. Brave little dog, his first thought had not been for himself, but for the baby, and seeing the danger which threatened, he had lost no time in bringing her to safety. Since that day Tramp has been considered one of the family, and the best in the house is none too good for him.—Our Dumb Animals.

A LESSON IN ADDITION

A. P. Sandles, a well known agricultural leader, submits a lesson in addition that merits the most careful consideration of every boy as follows:

"Twenty plus fifty is more than fifty plus twenty. This rule is true when life's work is added up.

"Today, a boy is twenty. A man is fifty.

"Today, we give to both a scientific knowledge of agriculture, and the secret of growing more crops per acre.

"Three score years and ten, they live and labor.

"At the end of life the boy's product, from soil and toil, will exceed and excel that of the man who waited until fifty to begin to farm the best he could.

"After the lesson was learned, the boy had fifty years to labor. The man had only twenty.

"He who plows and plants adds wealth to the nation. Twenty plus fifty is more than fifty plus twenty."

HOT DISH MATS

Mats are useful in preventing the marring of dining table tops by hot plates and dishes. A material for mats that has found considerable favor among housewives recently is a pyroxylin coated fabric made to resemble leather and largely used in place of leather for upholstering furniture, automobiles, etc. It is to be had coated on both sides, or with napped back. What makes it especially adapted as a mat material is the fact that it is waterproof. No liquid, hot or cold, can penetrate it. If it becomes soiled, it can be washed without changing its appearance, with ordinary soap and water.

The Cultivator Patterns

BE SURE TO SEND SIZE

2855. Girl's Dress. Cut in 4 sizes: 6, 8, 10 and 12 years. Size 10 requires 3⅞ yards of 27 inch material, with 1 yard for bolero. Price, 10 cents.

3215. Ladies' Dress. Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 6⅞ yards of 40 inch material, or 4 yards for the underwaist and skirt, with 2⅞ yards of contrasting material for overblouse and tunic. The width of the skirt at its lower edge is 1¾ yards. Price, 10 cents.

3193. Boy's Suit. Cut in 4 sizes: 3, 4, 5 and 6 years. A 4 year size will require 2½ yards of 44 inch material. Price, 10 cents.

3190. An Attractive Apron. Cut in 4 sizes. Small 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. A Medium size will require 5¾ yards of 36 inch material. Price, 10 cents.

3217. A Good School Dress. Cut in 4 sizes: 6, 8, 10 and 12 years. A 10 year size will require 4¾ yards of 36 inch material. Price, 10 cents.

2869. Misses' Dress. Cut in 3 sizes: 16, 18 and 20 years. Size 18 will require 5¼ yards of 36 inch material, if skirt is made with tucks, and 4¾ yards if made without tucks. Width at lower edge is about 1 2-3 yards. Price, 10 cents.

3195. A Dainty Frock. Cut in 4 sizes: 4, 6, 8 and 10 years. A 6 year size will require 3¼ yards of 36 inch material. Price, 10 cents.

3204. Ladies' House Dress. Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 38 will require 8⅜ yards of 24 inch material. The width of the dress at the foot, with plaits extended, is 2¼ yards. Price, 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS
10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT

Los Angeles

INDIRECT LIGHTING

Have the walls and ceilings of your rooms of a light color and use lighting units that conceal the source of light. See that no reflection from polished desk tops and calendered papered enters the eyes. The eyes are very sensitive to the entrance of light from below, as anyone having had experience with sunlight reflected from snow well knows. Semi-indirect units are good for parlors and sitting rooms, but for offices the total indirect units with light colored walls and ceilings are far better.

PRESERVE THE MARKET BASKET

A good willow market basket could be bought a few years ago for a dollar. We all know what a nice one costs now. It pays to keep the old basket in good condition as long as possible.

It will help to do this by applying a coat of stain finish, obtainable at any paint store. This makes it weather proof.

SCALLOPED SALMON AND PEAS

One can salmon, one cup white sauce, salt and pepper, a few leaves of mint, one pint peas, one onion.

Drain liquid from the salmon and pick free of all skin and bones. Cook the peas until tender, add the sauce, colored with a little spinach juice, and the crushed mint leaves. Place a layer of the salmon in tbe bottom of a glass baking dish, over this layer place the peas, and on top of that the remainder of the salmon. Season tbe peas well with salt and pepper and the chopped onion before placing them in a baking dish. Cover with a few buttered bread crumbs and bake in the oven for about 30 minutes.

RICE PUFF

Half cup rice, one-fourth pound cheese, one egg, one-half teaspoon salt, pepper if desired.

Boil the rice and while hot stir through it about half the cheese cut into thin slices. Season and add the beaten egg. Turn into buttered bake dish and slice remainder of cheese over the top. Set in hot oven about 15 minutes.

A ONE EGG CAKE

One-third cup shortening, one cup milk, four teaspoons baking powder, one and three-fourths cup flour, one cup sugar, one-quarter teaspoon salt, one egg.

First cream the shortening, then add the sugar and beaten egg, also part of milk and part of flour. Beat thoroughly, then add the remainder of the milk and flour. Beat thoroughly again.

SWISS STEAK

The toughest piece of steak may be made tender and palatable by pounding salt, pepper and flour into it, browning thoroughly in hot fat, adding water, covering closely, and allowing it to steam for about an hour, or until tender. This is known as Swiss steak.

DIFFERENCE IN DOGS

Sam was reading the paper, when suddenly he snorted, and addressed Mrs. Sam:

"What tomfoolery, Maria! It says here that some idiot has actually paid a thousand guineas for a dog!"

"Well, my dear, those well bred dogs are worth a lot of money, you know," answered his wife.

"Yes, of course, I know that. But a thousand guineas! Why, it's a good deal more than I'm worth myself."

"Ah, yes, Sam, but then some dogs are worth more than others, you see."

ONE WAY OF IDENTIFICATION

"We got twins over at our house," said Johnny, boastfully, "and they're alike as two peas.

"How do you tell 'em apart?" asked the neighbor.

"Oh, I put my finger in John's mouth, and if he bites I know it's Jim."

WASN'T HER FAULT

Doris was rather backward in her studies, and one day when her father was inquiring into her standing at school the little girl admitted that she was the lowest in her class.

"Why, Doris, I am ashamed of you!" exclaimed the mother; "why don't you study harder and try to get away from the foot of your class?"

"It ain't my fault," replied Doris, in tones of injured innocence, "the little girl who has always been at the foot has left school."

A CULINARY DEMAND

"Sure, mim," said the new cook, suddenly appearing in the doorway, "could I be afther borryin' th' boss's safety razor for a little whoile?"

"Safety razor?" echoed Mrs. Noo. "What for, Norah?"

"Sure, mim, I want to shave that rabbit before I sthew him.——Harper's Weekly.

SILENCE FOR REVENUE

"Of course, you have some convictions in matters of public concern."

"Mebbe," replied Farmer Corntossel.

"Well, why don't you come out and express them?"

"I dasn't. We've got boarders from all political parties."

YES AND NO

City Lady (down on the farm)—"Oh, what cute little cowlets."

Farmer—"Pardon me, Madam, those are bullets."—Quoted.

To mend buttonholes in neckbands of shirts, stitch pieces of tape flat along each edge of the buttonhole (and also on outer edge of tape) and bring together firmly at its ends.

Before doing spattery, dirty work at sink or table, put a thick piece of paper on the floor to stand on and later be burned. Saves the floor or its covering and does away with much sweeping and mopping.

Two Ameerican negro soldiers were discussing musical instruments. "Yar," said one, "I'se gwine ter git me a eucaliptis." "A what?" queried the other. "A eucaplitic—dat's a musical instrument, fool." "Go on, nigger! You can't kid me—dat's one of de books ob de Bible."

A Georgian from up in the mountains came to town on his annual trip with a load of corn, sweet potatoes and other produce to exchange for groceries. As he neared the city he saw a sign: "Speed Limit 15 miles an Hour." Prodding his oxen frantically with a stick he muttered: "By golly! I don't believe we can make it."

If you cannot be outdoors as much as you would like, at least let in all the sweetness of outdoors that you can—its fresh air, bird songs and flowers. Some of its sunshine will have to be excluded on account of the heat, but stale air is not cooling or restful.

Use black mosquito netting as a foundation for darning large holes such as boys wear in their stockings at the knees. This makes a firm, quickly done darn.

An easy way to remove a water stain from a table cover you do not wish to wash is to bold the stain over steam, shaking till moist, not wet. Take from the steam, shaking till dry.

A tablet in memory of the horses, dogs and other animals whose lives were sacrificed in the great war is soon to be erected in the state house of Massachusetts.

The loose parts of a gas range frequently become so greasy and dirty that they can scarcely be cleaned. Place these parts on the coals in the wood stove when the fire is low and it will quickly burn them quite clean without injury.

A teaspoonful of ammonia in a cupful of water will clean gold or silver jewelry. A few drops on the under side of a diamond will clean it immediately, making it very brilliant, at the same time doing the stone no harm.

Try this good and easily made toast. Dip stale bread quickly into cold, sweet milk, or brush a little cream on either side, then crisp and brown in the oven. It will need no butter.

Many very fine residences are not "homes."

THE refreshment tray can always thank Ghirardelli's Ground Chocolate for its magic aid. Creamy hot chocolate to drink; cakes with possibly a chocolate filling and frosting; waxy squares of chocolate fudge—not to mention countless other "goodies"—appear in a twinkling when the hostess summons the ever-ready can of Ghirardelli's.

Never sold in bulk—but in cans only.
In ½ lb., 1 lb. and 3 lb. sealed cans—
at the store where you do your trading.

Say "Gear-ar-delly"

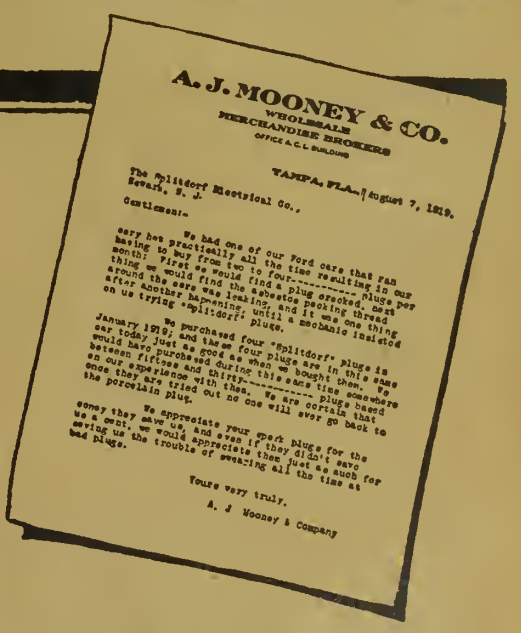
"For the money they save us"



A. J. MOONEY & CO.
WHOLESALE MERCHANDISE BROKERS
OFFICE A.C.L. BUILDING

TAMPA, FLA., August 7, 1919.

The Splitdorf Electrical Co.,
Newark, N. J.

Gentlemen:-

We had one of our Ford cars that ran heavy but practically all the time resulting in our having to buy from two to three sets of plugs per month. First we would find a plug cracked, next thing we knew was a leaking, and it was one thing after another happening until we came to the conclusion that we would find the asbestos peeling somewhere around the core was the trouble, so bought them. We tried another make with them, but they were no better on us trying Splitdorf plugs.

We purchased four "Splitdorf" plugs in January 1919; and these four plugs are in this same car today, just as good as when we bought them. We would have purchased during this same time somewhere between fifteen and thirty---------- plugs based on our experience with them. We are certain that once they are tried out no one will ever go back to the porcelain plug.

We appreciate your spark plugs for the money they save us, and wish if they didn't save us a cent, we would appreciate them just so much for saving us the trouble of servicing all the time at bad plugs.

Yours very truly,
A. J. Mooney & Company

The plug with the Green Jacket

THOUSANDS of engine owners have eliminated the item of spark plug cost from their up-keep by the use of Splitdorf Spark Plugs. The main reason is that "The Plug with the Green Jacket" is insulated with East India Ruby Mica that never chips, cracks, or breaks. Each one is absolutely guaranteed against breakage.

There is a type best suited for every engine. Write for booklet designating the type for *your* car, tractor, or truck engine.

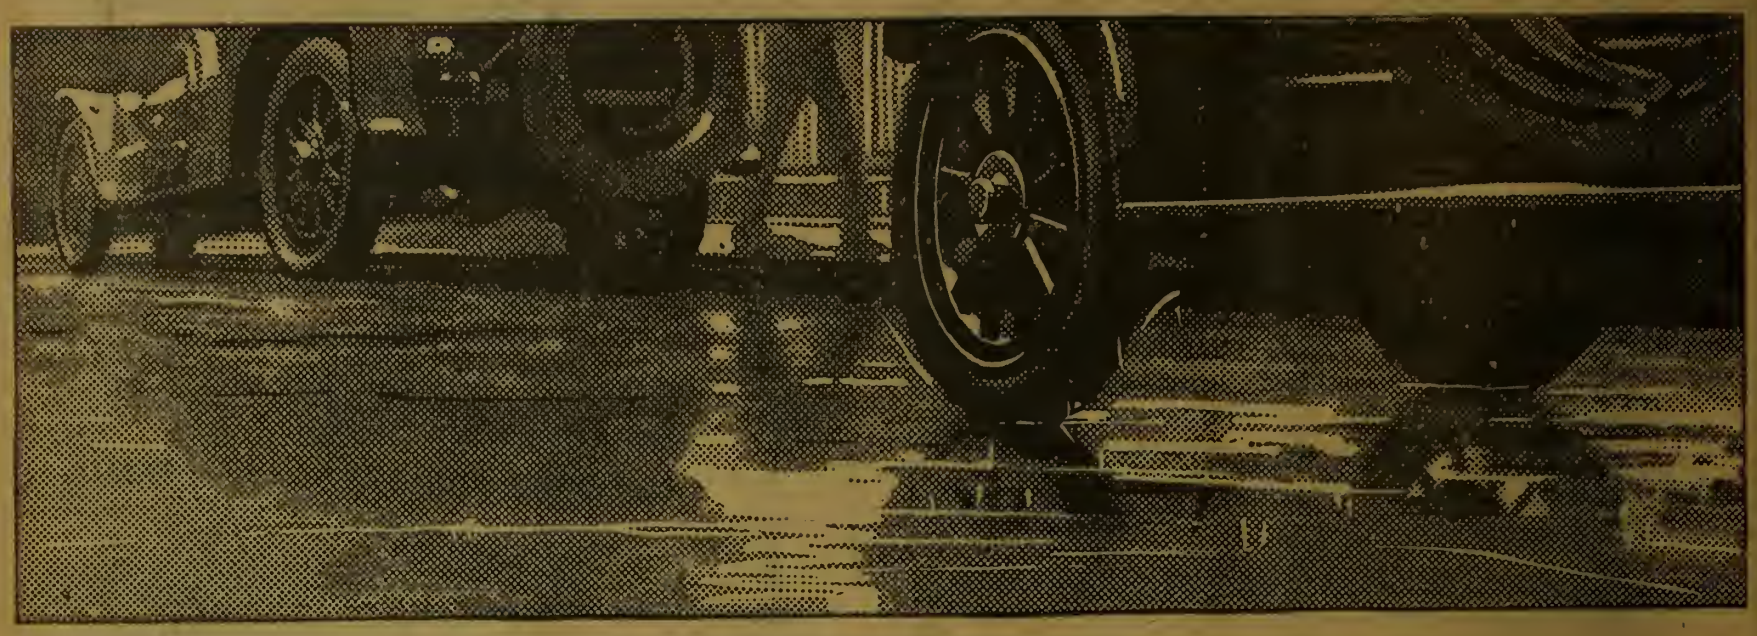
Better Tires *not* More Tires



Every time a tire is left standing in a puddle of water, the tiniest hole is likely to let enough water through to loosen the fabric, separating it from the tread and allowing sand and gravel to work in.

Go over your tires carefully every now and then and seal every cut or hole.

EVERY motorist remembers how it was with his first car. If he heard the slightest unfamiliar noise—a piston slap or a buzzing gear or a creak in the body—it was a serious matter. His friends were always ready with some helpful advice.

But the only time his tires ever made a noise was when he had a blowout.

Then everybody laughed.

The owner generally put on a new tire, paid his losses cheerfully and tried again.

* * *

For years the irresponsible tire dealer traded on the good nature of American motorists.

His idea of business was to sell a man two tires to replace an old one and to console him with the thought that after all motoring is a "great game."

Even today *not one motorist in five* is getting what he is entitled to in tires.

* * *

More and more the motorists of this country are learning that the remedy for high tire costs lies in *better tires*—not more tires.

And that getting better tires means first of all going to the legitimate dealer—the man who sells the known article and who does not attempt to substitute the unnamed or the unknown for the sake of more profits.

Since the beginning the United States Rubber Company has been looking forward to the time when motorists everywhere would come to *quality* in tires.

Building more tires every year, but never more than it could build in conformity with the highest standard of quality.

* * *

The responsible tire dealer never refers to his business as a game. It is a *business proposition* with him—and he knows the only way to make good in business is to make sure of the confidence of the motoring public.

Rich Pastures for California Range Cattle

A Survey of Cattle Ranges is Made by Mr. Spellmeyer and While There Are Some Disappointments, There are "Fine Feed and Fine Indications" in Many Sections

THE end of the range cattle industry in California has been deemed by some to be almost here. California's orchard interests have grown amazingly in importance and the cattle and sheep industry, so far as it depended upon range conditions, has to an extent decreased, but during the past half dozen years more general study has been made of the possibilities. The forestry service has given it encouragement; the Cattlemen's Association has been organized and today has a most enthusiastic membership, and saving the wastes of California hillsides and forest reserves is becoming a real patriotic service.

This is a season in which there has been a severe testing of the cattlemen who have depended upon the ranges. The spring rains, have, however, saved the day for many a cattleman. Many, however, are still asking: "But have they?" The most helpful answer is given by Mr. Spellmeyer. He has been making investigations from the extreme southern end of the state to the north central portion, and we trust cattlemen will find helfpul suggestions in this report of his survey. It is short and crisp but straight to the point and gives the information desired.

By A. L. Spellmeyer

San Diego County

Good, plentiful rains. Could use more cattle.

San Jacinto and Hemet

Fine feed, good crops. Better range feed than for 20 years some old timers say. Can use more cattle.

Victorville, Lancaster and Desert

Good desert feed, best for years, cattle doing fine, tendency to overstock, but present feed for three times the cattle they have now.

Los Angeles County

Much natural feed for small lots of stock. All better than normal. A garden spot and everything doing fine, crops and range feed.

Tehachapi District

Slow feed and rather cold, but fine rains and apparently sure late feed for several thousand more cattle within 60 days and good chance for September beef.

Bakersfield District

Feed is fair but disappointing except in certain favored locations. No demand for cattle to amount to anything, yet.

Porterville-Visalia District

Fine feed and fine indications. Need more cattle, especially foothill men who go to high Sierras. No stock movement owing to uncertain market for beef due to manipulation, rather than supply or demand.

Madera-Merced District

Feed started but neither normal in quantity nor quality. No overflow for several years in some of districts which are heavy feed producers. Very few cattle and very little demand comparatively. Future of this district depends upon more rain in quantity, as the showers are not adequate. Grain is suffering throughout the San Joaquin already and under-normal crop predicted with certain loss already.

Santa Barbara and Coast District

Extra good year, plentiful feed. Will have beef. Fairly stocked but lighter than usual in numbers.

W.I.R.E.D.

STORAGE BATTERY

Willard Th[illegible] Insulation

Insulation - the most important thing inside your Battery

Insulation is the material between the positive and negative plates, which keeps them from short circuits and thus safeguards the satisfactory performance of your battery.

Insulation, if it's *Willard Threaded Rubber Insulation,* keeps right on doing this important job to the very end of the battery's life—*but* if it is ordinary wood insulation it usually wears out before the plates do and has to be pulled out and thrown away and *you* have to foot the bill.

It is absolutely a fact that nobody had ever devised a really bomb-proof, good-for-life automobile battery insulation that would last as long as the plates, till Willard invented Threaded Rubber and put it between the plates of the Still Better Willard Battery.

Therefore seeing it's the one most important thing inside your battery, drop in and see me next time you're in town and let's talk this question of *insulation* over in more detail.

Willard Service

REMEMBER!

Batteries may be starved to death.
Batteries may die of thirst.
Batteries may be injured by overheating.
Batteries may freeze to death in winter.
Any battery will ultimately wear out.

Willard Service can help you avoid all but the last.

Tree Inspection Records

By C. C. Miller

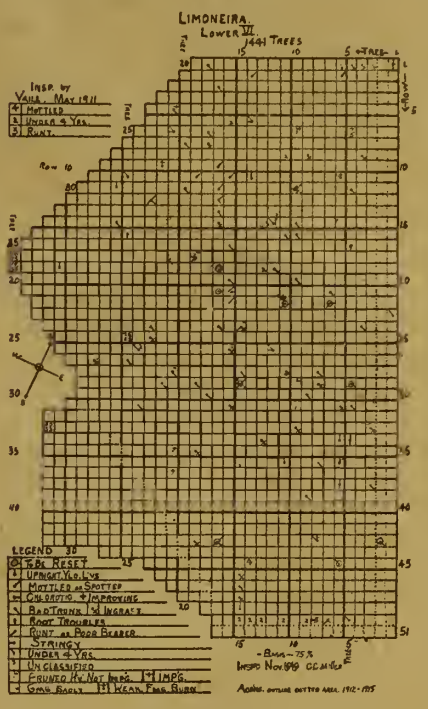
WHEN returning to a tree for the purpose of reporting its condition it is often very difficult to recall or form an exact mental picture of what the tree looked like the year before. Some previous notation will aid the inspector and will enable him to make comparisons and arrive at some definite conclusions. Written out notes or card systems are more complete, but after a time become cumbersome and are not easy of access. Photography may be employed to supplement any form of tree notes and is very useful in compartive work where exactness is required in checking up the results of specific treatments. The chart here reproduced for the readers of the California Cultivator illustrates a simple method of analyzing tree conditions while in the field. The outline of the section is drawn over a sheet of cross ruled paper 8½ by 14 inches and is suitable for filing away in loose leaf folders. If so desired, cross ruled outlines may be made upon transparent cloth parchment and blue prints made of the section or orchard.

Each hollow square as drawn represents the ground area occupied by a tree, and a dot in the center the location of a tree trunk where some notation is desired. Lines radiating out from the central dot in eight directions, together with other simple marks, register different ailments and are explained in the legend. Heavier lines are drawn every five trees each way to aid the eye in locating tree squares. Rows commence at the top of the chart and count down—tree numbers from right to left, always away from the most conveniently located corner. To locate a tree in its proper square on the chart it is necessary to follow the line of its row number from right to left to where it intersects with the line of its tree number running from top to bottom. For convenience all trees should have two numbers painted upon their trunks, one above the other; row number above and tree number below. All trees will show by their numbers that they are so many rows down from the point of beginning and a certain number of trees in from the point of beginning. The chart may be carried folded up as a road map in an inside pocket and ready for reference or a new notation at any time. Soon many trees will assume a distinct individuality; sick trees will receive more special attention and drones will be uprooted.

We are often asked if it really pays to keep watch on individual trees and make records. In answer we can state with certainty that it not only shortens the rounds of an inspector but enables him to check up his work and save many a tree that might otherwise be lost sight of. From the very beginning of his active management of the Limoneira properties. J. D. Culbertson has encouraged and assisted men at the heads of the several departments in making out permanent records of work done in the orchards, such as cultivation methods, insect control and the records of individual trees which could not be brought up to a fair standard of production and trees infected with disease. It was often very hard to get the newcomer to appreciate the value of comparative data put down for future reference. Mr. Culbertson has maintained that memory could not always be depended upon in such vital matters as orchard practices carried on over a term of years and that in order to trace an effect to a cause, the history of cultural methods, whether it be applied to a tree, a row, or a block of orchard, must be accurately known if we were to profit by past mistakes.

R. S. Vaile made an inspection of the section illustrated, in 1911. Tree 12-10 is still mottled; has a crooked trunk and continues to be a runt. Tree 45-14 has entirely recovered and is now a fine tree. Tree 50-8 has a fair set of fruit but is stringy in growth. Tree 18-19 is stringy and is still a runt in spite of the fact that it has been specially cared for and heavily pruned. Tree 22-11 is now badly chlorotic and a runt and it is believed that further observation will not do us or the tree any good, so it is recommended reset. Three 29-15, classed as a runt by Mr. Vaile, is now spotted, has a bad trunk and noticeably still a runt, so will be reset.

Trees that are normal and average above a given percentage of the actual condition of the section receive no notation in their respective squares.



The block of orchard may be noticeably below average either in the condition of the trees or in the amount of fruit on the trees at the time of inspection, and this fact should be noted on the margin of the chart and taken into consideration when judging the trees individually.

Runts may be located and poor bearers eliminated in deciduous orchards if a few years of records are made at fruiting time and carefully set down for comparison. Lemon trees will show up most of their weaknesses in the fall of the year.

Before a tree to tree inspection is made, the section or orchard as a whole should be sized up and a comparison made with past years as regards the general condition of the trees and the probable fruit yield. Then after a comparative average with other years is arrived at, the best trees or group of trees are looked over carefully and taken to represent 100 per cent condition for the time being. It may be that the orchard is below its average seasonal condition and if so this fact should be written out. Then going farther into the section, groups of trees are noticed which are out of condition, and if so desired, a light pencil circle is drawn around the outer bounds of the group and on the side of the chart a notation made as to the probable cause. The object of the first preliminary survey must be to get at the fair average condition of the trees at the time when tree to tree inspection is made. Comparative data is most necessary, for it may be that some cultivation practice is at fault, or a weakness has been accentuated by fumigation, by spray or by faulty pruning methods, and it is necessary to keep such factors in mind when passing on the condition of trees individually.

Characters may be adopted which are suited best to the individual's needs. Quick comparisons may be made by laying charts of diferent dates side by side. Water colors applied with a very fine brush are very good distinguishing marks when transfering data to permanent records. It is hard to get the habit; almost like keeping up a diary, but once well under way, making tree records will become as interesting and as important as keeping the pedigree of animals. It will furnish a source of much information and will pay well for the extra time spent upon it.

Water Conservation

By E. L. Koethen

A PARTY of about 35 had a demonstration of practical water conservation at the cone of the Santa Ana River intake on May 15 when they inspected the work that has been done there in spreading water over the cone.

The party consisted of directors of all the water companies in Riverside and Orange Counties who are interested in this source of water. President Francis Cuttle of the Water Conservation Association headed the party.

There are four points from which the water is diverted from the main channel. At the present time about 6,000 inches of water are being sunk into the gravel by spreading in small streams and creating ponds over a large portion of the surface. The association controls about 3,300 acres where water could be spread. By extending their work 160 inches of water could be sunk per acre. But if only ten inches per acre were sunk, it would amount to 3,000 inches, and if but a small portion of this were eventually utilized as irrigating water it would represent a large amount of wealth for the Santa Ana Valley at the prevailing price of $1,000 per inch.

The immediate occasion for this inspection was to view the working of a new type of dam that has just been installed, and which is doing the work with satisfactory results. It is the Pratt type, consisting of an iron frame with posts holding wire netting of one-fourth inch caliper with six inch mesh. There are two tiers of these, one being 6½ feet above the surface of the bed and three feet below, with an apron running 16 feet up stream from the dam and resting on the bottom. The top of the dam is faced with a wooden sill and is on a dead level. The secondary dam is about six feet below the upper one and is 5½ feet high. The one wing is anchored to a concrete intake while the other is constructed up stream a sufficient distance to insure permanence, perhaps one-half the width of the dam up stream.

When the flood came this was an empty frame and in a few hours the grass, sticks and other debris had accumulated sufficiently to make a close dam, and sand and gravel completed the surface of a new stream bed six and a half feet above the original bed. At the height of the flood it was covered by a stream about four feet deep and approximately 110,000 inches of water were flowing over it, and yet it held perfectly. This was constructed at a cost of $1,375. The association has thus far expended an annual amount of about $2,500. This year it amounted to $3,500, and the wonder is how they have been able to do so much for so small a sum. Mr. Cuttle made an appeal for larger appropriations, and it was the unanimous opinion of those present that from $15,000 to $20,000 should be made available for this work in order to install new dams.

When one considers the real import of this work, one is amazed at the result. We have just gone through several years of deficient rainfall. In the past these periods have been followed by the lowering of artesian wells in the San Bernardino basin to points many feet below the flowing level. As a matter of fact, the west portion of this basin, which receives its water from Lytle Creek, is now below normal level and water in normal flowing wells is eight feet below the surface, while those wells located in the east section under the Santa Ana

(Continued on Page 732.)

Agricultural News Notes of the Pacific Coast

Northern California

Sheep shearers are receiving 21 cents per head.

It is estimated that California will ship 10,000 cars of peaches this season.

Grape growers of Livermore Valley are organizing grape growers association.

Livermore, Alameda County, is discussing the formation of water district.

The agricultural clubs of Eldorado County will hold May Day festival at Placerville.

There is considerable interest in sweet potato planting in Placer County this year.

The usual thousands of California producers picnicked at the University Farm, Davis, last Saturday.

Owing to the switchmen's strike many stockmen employed large trucks to deliver sheep and cattle.

Most Sacramento Valley fruit producing sections report fruits at least ten days in advance of last season.

Florin, Sacramento County, will ship at least 15,000 crates of strawberries. The season is at least two weeks early.

Henry Ahart of Lincoln is wool director for Placer County in the state farm bureau wool pool now being formed.

The park commission of Chico, Butte County, has set aside five acres in Bidwell Park for an automobile camping ground.

The annual meeting and picinc of the Mt. Pleasant, Placer County, farm bureau will be held on May 8 at the community hall.

Eldorado County farm bureau is doing most effective service for members through the work of the auction sale committee.

Local meetings of the Tehama County farm bureau will be held at Corning, April 21; Liberal, 22; Los Molinos, 26; Proberta, 28.

Members of the farm center at Livermore, Alameda County, recently took a two day trip and enjoyed institutes and picnic.

Expert sheep shearers at Dixon, Solano County, have earned as high as $31.50 per day this year. The most expert of the bunch has a record of 150 sheep per day.

The chamber of commerce of Grass Valley, Nevada County, is working on a plan for the formation of an irrigation district to cover lands in Nevada, Yuba and Sutter Counties.

The University of California has taken over 2,000 acres in southwestern El Dorado County and in addition has leased 1,300 acres of mountain range to be used as an experimental cattle ranch.

San Francisco commission men refused to purchase or handle peas delivered by the Alameda County Pea Growers Association. They insisted the price named by the pea growers was too high.

President Tucker of the California Almond Growers Association has just made an extensive tour of the northern counties and states that damage to the almond crop from drouth and heavy frost is more severe than he had expected from reports that reached the office.

Central California

Fresno has been compelled to truck in its sugar from Stockton.

Dinuba, Tulare County, is making a special squirrel campaign.

Dr. Boncquet has been appointed plant pathologist of Tulare County.

Farm bureau center at Poplar, Tulare County, is discussing matter of hog sales.

Lindsay hauled ice by truck from Fresno to save picked oranges during switchmen's strike.

The Farmers Union recently held quarterly convention in Turlock. State president presided.

Aromas, San Benito County, is discussing the matter of buying auto tires cooperatively.

Kadota figs are to have right of way in packing house to be erected at Reedley, Fresno County.

Tulare County is preparing for a great showing of livestock at the county fair to be held this fall.

The Merced irrigation district has taken steps to secure 120,000 acre feet of water from Burns Creek.

Aromas, San Benito County, is planning for a cooperattive cannery under management of the farm bureau.

The Stanislaus County Farmers Union is planning for a great picnic to be held sometime this month.

Fig growers are hoping to be able to market the coming season's output through the California Peach Growers.

Sealer of Weights and Measures Johnson has ruled that a sack of onions shall contain not less than 100 pounds.

Inyo County is becoming a honey producing center. The representative in the Honey Producers Exchange is A. Trickey.

The South San Joaquin irrigation district is preparing for survey for reservoir on Black Creek, a few miles above Oakdale.

The welfare commission announces that it will give out on May 1 schedule for women's wage in canneries the coming season.

Pajaro Valley reports shortage of apple trees for next season's delivery. Even Eastern farm papers are referring to the "dollar tree."

At the recent annual meeting of the California Honey Producers Cooperative Exchange, Willis Lynch of Stockton, was elected president.

Sales Manager Thomas for the California Peach Growers is investigating marketing conditions in the East and receiving orders for the coming season's output.

The California Peach Growers Inc., is mailing checks for 4½ cents per pound last season's delivery. This brings the average for season up to 14½ cents per pound.

One of the oldest grape vines in Fresno County, taken from the old Eisen orchard near Fresno, is to be carried on a float in the historical pageant section of the Raisin Day parade.

Some cotton growers of the San Joaquin Valley are planting Durango instead of Pima cotton. It had been hoped by cotton planters that the San Joaquin might be kept for exclusive Pima planting in order to keep seed pure.

Southern California

Orange County reports apricot crop half that of last year.

San Diego County will observe May 8 as Inland Highway Day.

May Day was picnic day for Orange County farm bureau folks.

Elsinore and the Perris Valley are planning 4,000 acre cotton plantation.

Farm bureau people of Riverside County picnicked at Moreno last Saturday.

Yucaipa, San Bernardino County, is becoming a large poultry producing section.

"The greatest honey production in five years" is the report of Riverside beekeepers.

The San Joaquin Ranch in Orange County will harvest an 80,000 sack crop of barley.

Cucamonga, San Bernardino County, is planning for a dehydrating plant for wine grapes.

The farm bureau recently held spraying demonstration at Yucaipa, San Bernardino County.

Palo Verde Valley, Riverside County, anticipates its cotton planting will be completed by May 1.

"Greatest flow of honey in five years" is the report of many honey producers in Southern California.

Notwithstanding low prices for lemons, many shipments are being made, especially to Middle West sections.

Cattlemen of California held an important meeting, with greatest attendance ever, at Los Angeles last week.

Prof. Quayle of the experiment station is making an extended campaign and investigation in codling moth control.

The farm bureau center at Chino, San Bernardino County, recently held institute on the Fontana Poultry Ranch.

A consignment sale of Holsteins was held Tuesday and Wednesday of this week at Clearwater, Los Angeles County.

The cannery at Elsinore is being enlarged and equipped with up to date machinery in preparation for the coming canning season.

"Never such wild flowers as may be seen now on the desert" is the report which comes from everyone who has been out to gather bouquets.

Ventura County beet growers are anticipating that from present sugar prices they ought to receive this year at least $20 per ton for beets.

Secretary Van Pelt of the Southern California Fair at Riverside reports building of new stock sheds and stables and preparations for the greatest fair yet.

Orange County farm bureau hopes to ally every farm center with the movement for county fair in a way to make it the greatest agricultural fair yet held in that county.

Large accessions were made to the Cattlemen's Association at the recent meeting held in Los Angeles. Ventura County was one of the banner counties in rolling up membership.

A large corporation is planning impounding and developing waters in San Gabriel and San Dimas Canyons in the Sierra Madre, which will cost four millions of dollars and provide waters for 30,000 acres.

The Coast and General

There have been heavy late snowfalls in the northern counties of Arizona.

Wheat growers of Washington plan large cooperative selling agency with headquarters at Spokane.

A potato grower of Yakima, Washington, has refused offer of $150 per ton for two tons of potatoes.

Jersey breeders of Coos County, Oregon, are organizing to prevent dumping in that section of inferior bred Jerseys.

Warmer weather in the lower valleys of Arizona has brought renewed activity in planting and replanting cotton.

Dairymen of Canyonville, Oregon, have associated themselves for the purpose of cooperative buying of pure bred stock.

Oregon farmers are proposing annual spring clean-up day, their energies to be devoted principally to the back yards.

The cotton acreage of the Salt River Valley of Arizona is estimated at 150,000 and between 30,000 and 40,000 in other parts of the state.

One dollar and ten cents a pound was recently received for several bales of Arizona long staple cotton. The highest previous price was $1.02.

The lettuce crop in the Salt River Valley of Arizona this season has totaled about 250 carloads. About one-half of this was from the Glendale district.

Columbia County Fair at St. Helens, Oregon, is planning to set aside questionable concessions and make special features of clean, wholesome sports as a drawing card.

Forty-five dairymen of the Coos Bay district, Oregon, have formed a cow testing association. This is the fourth association organized since January 1 in Coos County.

The Spokane fruit growers have already received 200,000 apple box shook for the next season's output. Prices are exceptionally high and it is feared that a sufficient supply will not be available.

Jersey breeders of Oregon are making plans for their second annual Jersey Jubilee to be held May 4, 5 and 6 and possibly 7. The celebration takes the form of automobile tours to various Jersey herds of the state.

W. R. Elliott, for the past several years manager of the Salt River irrigation project, has placed his resignation in the hands of the board of governors. A successor has not yet been chosen and Mr. Elliott will probably serve until a man qualified for the place can be found.

Ed W. Stevens, secretary of the Arizona livestock sanitary board, states that "Arizona cattlemen stand to lose a cool million dollars this year from the ravages of blackleg unless prompt action is taken to prevent the recurrence of the malady which broke out on the ranges last year."

Plans are under way for organization of a farm loan association in the Eastern part of Maricopa County. There is a considerable area of land in this section which is not under the Salt River project and the owners of which are therefore entitled to the benefits of the farm loan account.

Lima Beans in Ventura County

By Ernest Braunton

WHEN beans are spoken of in Ventura County it is safe to assume Limas are meant for they have proven far more profitable than any other bean. In parts too remote from the Coast for Limas, also in very light soils, Whites, Blackeyes and other sorts are somewhat grown and though some of these will grow in the best Lima sections, few are planted.

The name Lima is used because the first of the beans reached us from Lima, Peru, more than a half century ago. In 1918 Ventura County grew about 65,000 acres in fields alone and from 6,000 to 8,000 acres in young orchards, a total of more than 70,000 acres. Last year there was a considerable decrease in acreage and one of the largest, oldest and most successful growers told the writer that the 1920 acreage would be at least 25 per cent less than that of 1919. When asked as to the cause for this decerase he replied: "Well, the chief trouble was the importation of foreign beans by the government. Several others expressed themselves likewise.

Preparation of Soil

The planting season varies with the weather, but this year the first planting the writer could unearth was done on April 12. It is seldom commenced earlier and may continue for one month, not longer. Soil preparation also varies much with the seasons, for all is dependent upon rainfall. The farther from the coast the fields lie, the earlier is both planting and harvesting finished. The Camarillo section of Ventura County has but one rival in earliness, and that is the Irvine section in Orange County.

When the harvest days are over the land is plowed as soon as convenient and left in a rough state until about January. Then soil stirring for moisture conservation begins and closely follows after every rain. This frequent and constant working produces such a deep, finely pulverized soil that any crop capable of growth in this soil and climate could not fail to respond to the uttermost. The heavier the soil the greater the cost of cultivation, ranging from five to ten dollars an acre. The first plowing is the most expensive operation, for the soil is stirred as deeply as it is practicable to go.

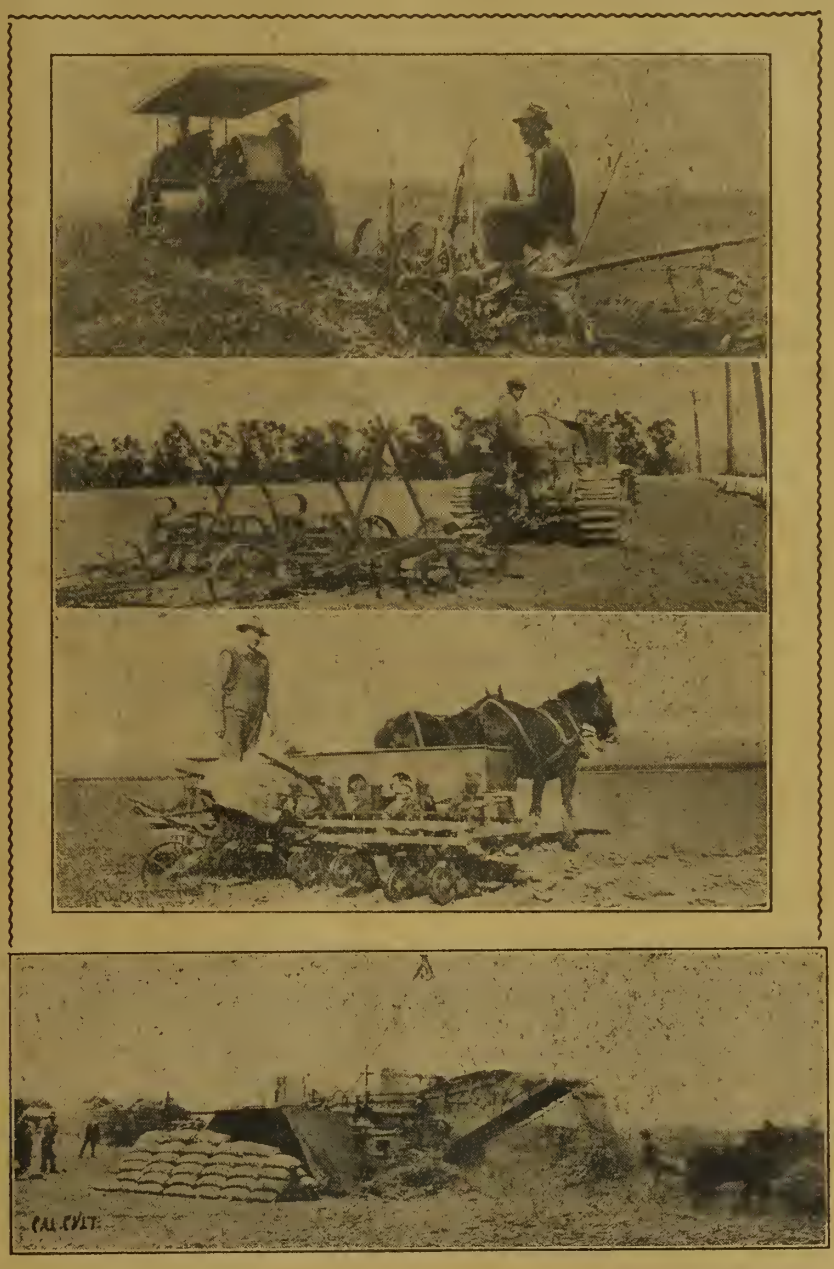
Planting and Cost

Beans are planted 30 to 36 inches apart, according to soil and practice. To furrow for irrigation in light soil, where it rolls back easily, a width of 30 inches will do. In heavier soils where it is thrown back 36 inches is a safer distance. The plants in the row generally run about six or eight inches apart. Thinning is sometimes done but is not general. Cultivation varies with soils, for weeds are not so many nor vigorous on the lighter soils. The amount of seed varies only with space between rows, ranging from 60 to 70 pounds an acre.

The total cost of caring for an acre from the first plowing to harvest is heavy. Time was when an acre cost could be covered with a 20 dollar bill, but under present conditions and costs it may run to $50. This cost is variable, dependent, so far as field practice is concerned, upon the number of harrowings or cultivations previous to planting and the number of cultivations necessary after planting. Wages and practice vary somewhat, but an average cost per acre may run about as follows, exclusive of irrigation, which is not always given: Plowing, $6; five harrowings at $1.25, $6.25; 65 pounds seed at 12c, $7.80; planting, $2.25; thinning (?), $6; five cultivations at $1.25, $6.25; hoeing in rows, $7.50; total, $42.05.

Cost of Harvesting

About four months after planting the harvest commences and the grower is again confronted with a considerable expense. The price of everything has fairly soared in the past two or three years. Bean sacks once were



bought for eight or ten cents each, but when they reached 22 cents the grower was staggered. The total cost of cutting, threshing, delivery, etc., did not run over ten dollars an acre three years ago. Now it would doubtless run about $20.

The cost of harvesting is cut down in many sections by groups of growers who own a thresher and other machinery in common. But professional threshers with big machines handle most of the crop. Small machines are also used, pulled through field by tractors. The variance in handling brings a corresponding elasticity of cost. The harvest usually begins with the cutter, a frame with knives, which cuts two rows at once and throws them into one winrow. They have then to be turned over by hand forks and are in condition to thresh in a week or ten days. Small threshers are fed by hand forks throughout, but large machines have a net device handled by ropes and pulleys that reduces the cost of unloading.

Yields, By-products, Pests

Ventura County seems to be so naturally adapted to Lima bean culture that the unsatisfactory returns of late are doubly regretted, for this section must continue to grow our Lima beans so long as Lima beans are produced in California. While the crop has run as low as five sacks per acre and on poor soils never more, the maximum production has been close to 4,000 pounds. Up to last year, an abnormally poor year, the average yield in recognized Lima bean centers was about 1,750 pounds to the acre.

Bean straw was once thought of little value, was sometimes burned or again plowed into the land for fertilizer, one of its best possible uses even now, at times of high fertilizer prices. But as stock food of all sorts and kinds advanced in price it was found that bean straw had a value for feeding livestock. In the past few years the price has ranged from $5 to $20 a ton.

Thrips, aphids and wire worms are the animal pests most serious, and morning glory, or bindweed, the worst weed. Thrips have never been serious and aphid damage varies with the weather. In some years, 1917 for example, the weather was unfavorable to them and they did little damage. In the previous year, 1916, the loss in some fields was considerable. The damage from wire worms is not general, but in some sections the pest is most serious and hard to control, especially so in the damper soils. The morning glory pest is not on the increase and is being fairly well controlled.

GETTING THE FARMER STARTED

By Frank D. Tomson

It seems to require a long time to induce many farmers to regard the production of pure bred livestock as a practical business. The tendency on the part of many of them still is to look upon it as a "fancy stock" business merely. Through lack of familiarity with the results obtained in the matter of increased production and increased profits, they fail to understand the important part which pure bred livestock can, and does, play in mixed husbandry, regardless of location.

In beef production, it is pure blood that makes greater weight and better quality, which, at the market, brings an increased price. It seems to be a prevailing impression, even among breeders, that it is not practical to raise pure bred streers for the market, but experience has shown, times without number, that there is more profit in pure bred steers than in grade steers and, very often, very much more profit in pure bred steers than in pure bred bulls. The breeder who holds to the opinion that all of his bull calves should be disposed of for breeding purposes has a mistaken notion. There is a great deal of satisfaction in putting out and finishing a lot of well bred calves as steers. They are handled with a minimum of inconvenience and respond readily to feed and when they go to market they find a ready sale at advanced prices.

The farmer who attempts to grade up his cattle from a common foundation has a long road to travel. Though every successive cross of pure bred sires shows a forward stride, even so it is a long road. From the time the first pure bred sire is used until his daughters are of producing age is three years, or a trifle more, and these are only half bloods. Another cross is introduced and three years more are required before the three-quarter bred heifers are of producing age and ten years have passed by the time the heifers of the third cross are producing.

In most cases it would be desirable to put in from two to one-half dozen pure bred females of whatever class the farmer feels that he can afford, then retain the female increase, disposing of the bulls, either for breeding purposes or as steers, whichever seemed to be the appropriate thing to do, and gradually sell off the grades as the pure breds increased in numbers. This would result in a pure bred herd obtained for the cost of keep and the interest on the original investment.

What every man who occupies a farm and grows livestock must recognize is this, that we have long since passed the time when inferior livestock may be grown with a profit and that life is too short to attempt to grade up from a common foundation to the level that satisfactorily meets the conditions.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

MR. THOMAS SELLS INTEREST

After many years of service as business manager of the California Cultivator, Frank H. Thomas retires to take a much needed rest and attend to other business matters. Mr. Thomas first became associated with the Cultivator family in 1906. He soon acquired an interest in the business, and became advertising manager and treasurer of the company. In 1914 he became busines manager and since then has had entire direction of the Cultivator Publishing Company. In 1910 the Rural Californian, established in 1877, was purchased and for a time published as a separate paper. Its publication was later discontinued and its subscription list added to that of the Cultivator. In 1916 the Livestock and Dairy Journal, prior to that time published in Sacramento, was acquired and with it the good-will of the livestock industry. In fact, it was due to Mr. Thomas' foresight that the Cultivator has given every encouragement to the livestock industry. While he realized that California's greatness has been made through its wonderful fruits and that the fruit industry was due to a continued growth in prosperity, yet to secure best advancement for the state more and better livestock was necessary. California is a state of specialists and of specialized crops and to a large extent this condition will always continue, but for the state at large greater diversity insures a continuous prosperity.

Mr. Thomas' interests in the publishing company have been sold to R. M. Teague who has been associated with Mr. Thomas since 1914. Frank J. Ironmonger, formerly advertising and assistant manager, will be business manager, and he will continue Mr. Thomas' policies. This he will be able to do because of more than a half dozen years of close connection with Mr. Thomas in the Cultivator management.

Almost the entire life of Mr. Teague has been spent with California producers. In fact, he has been one of California's largest producers of citrus fruit, and is the world's largest producer of citrus nursery trees. Mr. Teague's practical knowledge of California's conditions and of the requirements of the producers will be used to the utmost in making the Cultivator a practical, helpful farm paper.

SPIRIT OF 1918

County Horticultural Commissioner Waite of Imperial recently made inspecion of packages of "plants" at an Imperial County post office and found the "plants" to consist of two botties of whiskey. The dispatch does not announce as to whether the package pased inspection or not.

SAVE WASTE PAPER

The paper shortage is daily becoming more acute. Unfortunately, there seems to be no promise of relief. It may perhaps be wise for all of us to save the old magazines and waste paper rather than burn them in the trash pile. We have no immediate market to offer, but certainly the day is coming when war time practice of buying these papers will be renewed.

TEAMWORK

California farm bureaus are doing some magnificent teamwork. Often the membership of a county farm bureau represents most diverse producing interests, so much so that cooperation in the way of one association handling all products is impossible, but through teamwork or temporary cooperation fairly satisfactory results are secured.

Just at present in walnut growing sections people of various neighborhoods gather, observe the operation of dusting machines and often cooperate in purchasing dusting outfits. Thus far there has been no work done for the walnut worm, but the aphis is already appearing and dusting machines are busy in nearly every section. The construction of silos, especially their filling, the ownership of bean threshers, of combined harvesters, and other equipment offer to farm bureau members rich opportunity for successful teamwork.

OVERALLS

The overall movement seems to have died a-borning. This is entirely proper. However, it is possible that some of us have learned some lessons in economizing in our clothing. The foolishness of sending society folks to clothing stores to buy overalls in which to attend a poverty dance was so apparent that such a movement could not go far.

As the president of the University of Southern California has remarked: "We may well use good judgment in renewing and pressing into service our old suits. With the wool in a $100 suit of clothes costing from $5 to $8, there is too wide a margin for the jobber, the wholesaler, the tailor and the retailer."

Overalls are admirable in their place, and many of us have worn them with entire satisfaction; but when they are not in their proper place they add neither to efficiency nor economy.

TRUE TO NAME

If there is anything that makes an orchardist right down mad and puts him in a genuine cursing mood it is to plant an orchard, or to plant what was intended to be an orchard, and find that he has trees entirely different from those which he was supposed to purchase. Such a transaction is practically impossible where one deals with conscientious nurserymen, but the keen demand for trees which has prevailed during the past few years has encouraged a number of irresponsibles to become "nurserymen" and foist upon the public almost any kind of a tree which bears close enough resembiance to the particular kind ordered. County horticultural commisioners have been taking a hand in this matter and arrests have been made. Two of these arrests resulted in a $200 fine for each. The charge was simply selling stock untrue to name. We hope horticultural commissioners will continue this fight, for protection is due to the orchardist and to the conscientious nurseryman.

LIKE A SAVINGS BANK

Small sums of money not needed at once, and put in the savings bank, draw interest, and if frequently repeated accumulate and grow into sizeable sums. When opportunity comes they give power to their owner. Waters wasting into the Pacific are like money spent in dribbles, but, stored for use when needed, give power and increase wealth.

Mr. Koethen's account of the water conservation on the upper Santa Ana River has intense interest because of its showing of the saving of these flood waters. These waters are diverted from the main channel, spread over coarse gravelled lands in which they sink to the lower levels supplying wells and springs many miles away, and from which they are taken in irrigation canals to the orchards of San Bernardino, Riverside and Orange Counties.

A similar opportunity is offered at the mouth of San Antonio Canyon. These waters are spead over the gravel lands supplying wells and springs above Pomona, Ontario and Chino. True, there are not many such opportunities in California, but there are some. There should be greater conservation.

HOUSING LABOR

California agriculture is confronted by a serious problem in securing farm labor. More tractors and other farm power, crops which do not require so much labor, and other suggestions have heen made without the complete solution of the problem. At best these suggestions have given only temporary relief. Another is made by Mr. Culbertson in his article in the Cultivator of April 17, on page 649.

It has nothing to do with lessening the requirements for farm labor but recommends making farm life more attractive in order to secure more service more willingly given, in other words, for those having need for labor to forget the old blanket days when the labor practically cared for itself and to secure more permanent service through increasing the number of farm homes. Mr. Culbertson would stop the cry, "Me for the city!" and in its place substitute, "A real home for me in the country." Fortunately, there have been just such provisions made on a few of California's ranches. There will be more.

BUD SELECTION OF PRUNES AND APRICOTS

DEFINITE steps, which it is expected will lead to the growing of larger and better quality prunes and apricots in California and add millions to the value of the annual crops of these fruits, were taken at a meeting held Saturday afternoon in the offices of the California Prune and Apricot Growers, Inc., in San Jose, attended by the leading nurserymen and two score or more representative prune and apricot growers of the state.

As a result of Saturday's meeting the nurserymen who supply the growers with young trees for planting will conduct a series of experiments to develop a prune tree and an apricot tree which will consistently bear larger sized fruit of a quality at least equal to that grown at present. The growers have never been able to produce enough large sized fruit to supply the demand and the natural result has been that prunes and apricots above the average size have always commanded a high premium.

The nurserymen in their efforts to produce a tree yielding a larger sized fruit will take cuttings from trees in various parts of the state which have a record over a long term of years of producing large sized prunes and apricots. Many growers have in their orchards singie trees with such a record and by grafting buds from these trees the nurserymen hope to eventually produce a much higher type of tree than now planted.

Upon the advice of the growers the nurserymen will confine their experiments almost entirely to the ordinary French prune, which now yields about 90 per cent of the California crop. Future plantings, it is expected, will be about 85 per cent French prunes and 5 per cent each Imperial, Sugar and Robe de Sargent.

Cooperating with the nurserymen, the California Prune and Apricot Growers, Inc., which with a membership of 10,000 fruit growers markets about 75 per cent of the California prune and apricot crop, at Saturday's meeting offered to furnish the nurserymen with information from their records showing which orchards in the state had trees consistently producing over a term of years prunes and apricots larger than the average.

In producing a better variety of apricots for drying the growers suggested to the nurserymen that plantings in the San Joaquin Valley be Tilton and Blenheim varieties and in the coast valleys Royal and Blenheims, with small plantings of Moorparks for growers who desire to produce this variety.

UNIVERSITY FARM PICNIC

By R. P. Royce

LAST Saturday thousands of California ranchers and their wives and children, and other thousands of folks from the towns and cities of Northern and Central California, accepted the invitation of the students of the college of agriculture and the university farm school and journeyed to the university farm, Davis, for the twelfth annual picnic. In keeping with a custom, for which little or no reason seems to exist, but which apparently has been settled upon as proper, the weather man dealt a fine windy day—fine for the weather man, perhaps, but rather disagreeable for the visitors. However, no one seemed to mind much. They just held onto their hats with one hand and smiled and shook hands with everyone else and said it was the best picnic ever held. And it was. At least it seemed to be planned on a more extensive scale than former occasions and the boys apparently had put in a lot more studied effort, with the result that the whole had a more finished look.

Events started promptly at 8 o'clock with the livestock judging contest This year's contest was different from other years. Heretofore the contests were staged with little or no special preparation. But the boys decided several months ago that the contest afforded an opportunity to get more training in judging work than was possible under the present conditions, and they set about to hold a contest that would give them the training

(Continued on Page 742.)

Copyright 1920, by The Goodyear Tire & Rubber Co.

"It is of distinct advantage for us to use Goodyear Cord Tires instead of solid tires on our trucks hauling from orchards, because these big pneumatics track nicely through loose soil or plowed ground and do not really pack it. Solid-tired trucks are assessed $10 a ton here—pneumatic-tired trucks are assessed only $5 a ton because they save roads."—A. M. Edwards, of Edwards & Patillo, Fruit Growers and Truckmen, Fullerton, California

THE gripping and agile qualities of Goodyear Cord Tires on trucks have won for them many significant rural endorsements like the one presented above.

Whether an orchard lies in soft soil, or fencing is to be done in a grassy field, or a mud-bottomed hollow separates the back acres, the big Goodyear Cord Tires go through quickly.

So today farmers frequently point to the tracks of these tires in miry hog lots, soggy meadows and acres strewn with fertilizer, where they have made short cuts and saved time many times.

In all parts of the country, the observer can note crop loads, cushioned on the husky Goodyear Cord Tires, being hauled through sand and bogs, across furrowed earth and up slippery hillsides with impressive ease.

This intense serviceability of the pneumatic truck tire, founded on the supple toughness of Goodyear Cord construction, has been built out of that ceaseless endeavor to improve, which protects our good name.

Now a large amount of information, supplied by farmers and describing the advantages of pneumatic truck tires, can be obtained by writing to The Goodyear Tire & Rubber Company, Akron, Ohio.

GOODYEAR CORD TIRES

Cold Pack Method Not to Blame

Decayed products, not the cold pack method of canning, are responsible for the recent deaths of five people in Detroit who ate ripe olives, say scientists of the United States department of agriculture. They also say that if people would throw away or refuse to eat food that smells spoiled they would be insured against poisoning by the Bacillus botulinus, the bug that has come into the limelight recently through its nefarious behavior. This organism when present in canned food is the cause of active decay.

It is poor economy to eat food which has begun to spoil or rot. The person who does runs the risk of death. In every case observed of botulinus poisoning, the people who served the food knew that it had an unpleasant stench, a smell of decay or putrefaction, and it should never have been put on the table.

Ripe olives, which the Detroit health commissioner claims caused the death of the five in Detroit, are not canned by the cold pack method. No heat is used and the brine is not strong enough to prevent toxin formation.

Successful canning, so far as the danger from poisoning by the Bacillus botulinus is involved, depends not so much on the method selected as on the rejection of infected material at the start. Dirty, wilted and partly rotted food carries multitudes more of organisms into the canning process than fresh, sound, clean fruit and vegetables. Dirty tables, dirty jars and lids, sewage polluted water and flies are sources of contamination which should be eliminated.

Such food as has spoiled should be destroyed. Do not salvage it. If you do, you do it at a risk. It is not fit for human food and should not be fixed up into salads, mincemeat, catsup or pie stock.

Typical spoiled cans are readily identified. Doubtful cases, however, occur occasionally. A consumer unfamiliar with a particular product is frequently puzzled by its odor, as it comes from the can in an apparently sound condition. Cooking appears to be the practical method of eliminating the danger. Heat destroys the toxin, and if the jar, top and contents are heated until the contents to the very center of the jar are at a boiling point there will be no trouble.

Suspected foodstuff should not even be tasted, for death has occurred after tasting two teaspoons of spoiled product which contained the Bacillus botulinus. Feeding suspected food to domestic animals without safeguards is undesirable for some of them are very susceptible to the toxin.

No person should take the responsibility of serving other people any food product which has commenced to decompose. Let your nose be your guide and discard food with a putrid odor, warn the expert food chemists of the department of agriculture.

LIMONEIRA CAROBS

I have noted with interest your article in the last Cultivator on the carob. It will undoubtedly interest you to know that the Limoneira Company has now a plot of somo two acres of carobs two years old planted on a steep, rocky, dry hill, and many of them are five feet high. The seedlings which we planted were potted and very small and we have had a deal of trouble in keeping them wet. The experiment has been largely in my care and I have tried to learn all I could about the carob tree, but the information has been quite limited. I have written to several nurseries to try to get a hundred or more young seedlings, but so far have found none. However, we have come to the conclusion that it is best to hold the trees until they are the size of young citrus trees for planting, before putting them out, because it is so difficult to keep the top layer of soil damp around very small trees. I have just addressed a letter to the U. S. experimental gardens at Chico, and it may be that we can get a few trees from there this year. We have plenty of dry hill land back of our lemon groves for these trees if they prove a success.—C. C. Miller of the Limoneira Company.

THE OLIVE OUTLOOK

Exaggerated reports of death from botulinus poisoning in olives has created a serious situation in the olive industry in Tulare County, which is one of the largest olive producing sections in the world. Although olives in tin cans are subjected to such a heat in the retorts that all germs are killed, the heat being 235 degrees, while chemists declare a much lower temperature will kill all germ growth, the sale of the fruit has dropped to almost nothing, and where normally the packing houses have sold their output, this season a large percentage of the crop is still in the hands of the packers.

WATER CONSERVATION

(Continued from Page 727.)

River supply are at a normal flowing level.

As percolating water flows very slowly this process not only acts as an underground reservoir but also as an equalizer of dry and wet years.

The Orange County delegates were not unwilling to acknowledge that all the water that can be saved from flood flows, and thus kept in the valley up stream, is eventually available for the Orange County wells in future years.

All this expense has been met by voluntary cooperation, and it is only to be regretted that San Bernardino County has contributed but little towards the meeting of this expense. The system has the double advantage of saving flood losses by absorbing a portion of the flood water and storing for future use.

GUARANTEED COTTON SEED REACHES IMPERIAL

Through cooperative effort the state department of agriculture and the U. S. department of agriculture have succeeded in placing in Imperial County a supply of pure "Lone Star" short staple cotton seed sufficient to plant 110 acres. Three tracts of land, two of 40 acres each and one of 30, have been secured, and the seed has been delivered to the farmers for planting. The farmers agree to sell to the U. S. department of agriculture two-thirds of the seed crop for the prevailing oil mill price plus cost of extra handling. This seed will be distributed to the growers next season and will further supply the demand for pure seed. The growers also agree that seed sold by them from their one-third of the crop shall be sold at a fair price, such price to be passed on by the U. S. department of agriculture and the state department of agriculture.

The placing of the pure seed under such conditions will relieve the present serious shortage of pure short staple cotton seed, and by thus eliminating the desire to import seed of unknown strain from boll weevil and pink bollworm infested areas, will give added protection to the California cotton industry.

ONE REASON FOR THE SCARCITY

By W. V. Shear, State Department of Agriculture

The writer has just spent a week in the mountain districts of California discussing potato problems with the farmers in these sections. There are large areas well adapted for the production of potatoes throughout the state in which very few potatoes are grown for the reason that it is impossible to get them to market as they are harvested.

California has a wonderful highway system, because of the ease with which city people and tourists can travel over it. It also has another system of roads surpassing description owing to their impassability, especially during wet weather. To get to these farming districts, our party had to travel over roads where it required one person to drive the auto, and three others to push it through the mud holes and over the rocks. It was frequently necessary to pile brush and anything else that might be available into the holes before they were passable.

With good roads through these agricultural districts it would be possible for the potato growers to haul their potatoes to the nearest railroad stations and thus find a profitable outlet for them.

Riverside board of supervisors is contemplating passage of an ordinance providing for quarantine on bees from other sections of the country.

will help your motors

They have proved it by their service on many thousands of farms in the last ten years.

Time has established the "Leak-Proof" principle of insuring power and compression. McQuay-Norris Leak-Proof Rings are the only piston rings of their kind. There is no such thing as a "Leak-Proof type" of piston ring. Their design is exclusively their own.

These tried and true rings will help tractors, automobiles, trucks and stationary engines develop more power, save fuel and decrease carbon.

They are made in every size and over-size to fit every make and model of any kind of gasoline engine. Your dealer has proper sizes and over-sizes or can get them promptly from his jobber's complete stock.

Write for this Booklet →

"To Have and to Hold Power," which clearly explains piston rings and their connection with motor power and economy. Address Dept. AB

MOLINE

The Universal Tractor

DOES all field work—including cultivating, harvesting and belt work. One man operates both the tractor and the implement. The operator sits in complete safety in the usual place—on the seat of the implement.

The work is always in plain sight—no looking backward. Tractor and implement form one unit—can back and turn short.

These indispensable features are particularly profitable at harvest time, when one man instead of two can cut the ripe grain at the rate of 40 acres in 10 hours.

The necessity for saving time and labor is the greatest consideration before the farmer today.

MOLINE PLOW COMPANY

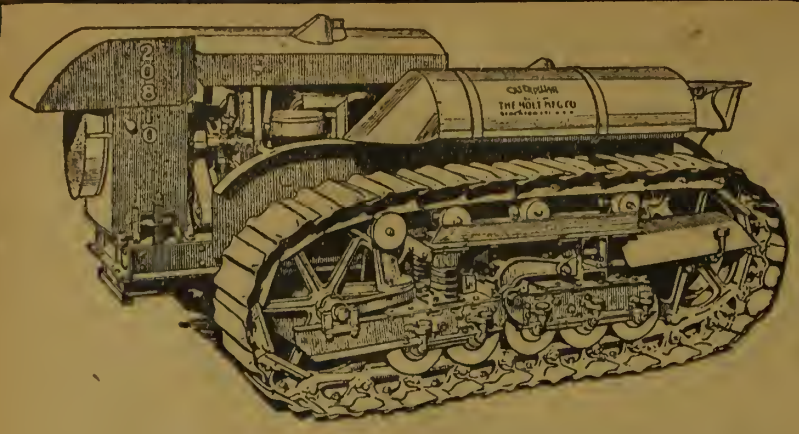
D., Des Moines, Bloomington, Ill., Indianapolis, Columbus, Ohio, Jackson, Mich.

Shorten Your Harvest Days



Liberal Power for Orchards

Here's the VERY tractor you've wanted for orchard work—a tractor that's big in power, strength and capacity for work, yet with the small tractor's ability to get between, under and around the trees. In the "Caterpillar" 45 Orchard Tractor you are offered a high-powered, short-turning, easy-handling tractor, of Holt superior design and construction.

COMPACT—Here is a tractor of minimum bulk with no lessening of practical serviceability. Note the torpedo-type shields—there are no sharp edges or corners to damage the trees or hinder the work.

POWERFUL—A big tractor in a small size is "Caterpillar" 45 Tractor. With its liberal power it can pull a sub-soiler. It can handle the orchard cultivation quickly, saving the moisture that is lost by evaporation when slower methods are used. It can do at one trip work that requires repeated travel of less powerful tractors—travel that bruises limbs and fruit.

DURABLE — Sound construction and surplus strength—found in this tractor—mean much in eliminating delays and providing continuous, consistent, trouble-free service, day after day, season after season.

FLEXIBLE—Short turning and quick response make the Orchard-type "45" an easy handling machine, even in closely planted orchards.

ECONOMICAL — Big capacity for work, coupled with low operating and upkeep costs make this tractor the best-paying investment.

Avoid the handicap of insufficient power. Avoid the expense of inferior quality. Make this Holt tractor—a proved success in orchard work—your choice.

SETTING OUT THE ORCHARD

The Victoria Journal of Agriculture, Austraiia, gives the foiiowing method of setting out orchards in that state.

In starting to peg out the orchard, different systems may be adopted. A method commonly used is to first obtain a straight base line by means of sighting poies about 6 feet long, with white paper wrapped round them to insure easy vision, and by using a rod of desired length to measure distance for pegs. A fairly satisfactory result may be obtained in this way by those experienced in the work, but a better plan is to use a measuring wire instead of the rod, as this insures rapidity and accuracy not possible in the other way.

The measuring wire should be made of No. 10 gauge galvanized wire of sufficient length to measure the longest row. An iron ring three inches in diameter is fixed to each end of the wire. One ring is placed on a bar or stake driven into the ground, and the wire strenched tautly to its full length, and the ring at the other end fixed in the same way. The measurements along the wire should be accurately made, allowing for an overlap of four or five feet at each end of wire between ring and first mark on the wire.

Commencing then at a point, say four or five feet from the ring, a piece of copper wire is wound round the measuring wire and soldered into position. This plan is continued every 20 feet, or whatever distance between the trees has been decided upon. The use of copper wire for markings is preferable to paint, as the latter is liable to rub off, and copper markings will be as readily visible as paint when pegging is being done. Pegs or stakes are then driven at each copper wire and the measuring wire swinging at right angle for the second side of field and also pegged. This gives the two necessary base lines, or all four sides may be pegged. To get precise right angle use the builders 3-4-5 rule. For field work we may multiply these figures by 20, making 60-80-100. Measure down one side 60 feet, down the other 80 feet, and when it is precisely 100 feet across the corner, the right angle is perfect.

CROP REPORTS

Bureau of Crop Estimates, U. S. Department of Agriculture

California fruits and nuts were severely injured by rains and frost during March. Brown rot, it is reported, will destroy from 30 to 40 per cent of the anticipated apricot crop, and prunes have been slightly damaged by the thrips. The almond crop will probably not exceed 45 to 50 per cent of that of a year ago. Shipments of California oranges during the first three months of 1920 aggregated 9,855 carloads, as compared with 11,413 carloads during the same period in 1919; and of lemons, 2,133 carloads, as compared with 2,086 in the first quarter of 1919.

Prospects for other crops in the state are much better than at this time last month. Planting of beans is proceeding under favorable conditions, although acreage will be materially reduced as compared with 1919. In the Imperial Valley, including that part located in Mexico, 225,000 acres have been planted to cotton, as compared with 145,000 acres in 1919, and practically all of the anticipated Pima or long staple crop is under contract.

A. A. Brock, Horticultural Commissioner, Ventura County

Apricots, 40 per cent.

Fred G. Stokes, Horticultural Commissioner, Lake County

Bartlett pear orchards are in excellent condition as regards pruning, cleanliness and cultivation, and present indications are for a good crop, although in spots orchards are lightly touched up by the frost of April 21 and 22. No pear selling has yet been done as last year growers who sold before the pears set, received some $30 a ton less than those who sold in May and June.

A Lake County Pear Growers Association was organized on Aprii 16, and it will tend to make priccs this year more uniform and selling iate. About 60,000 Bartlett pear trces were planted in Lake County this season and are doing weli.

About 1,700 French prune trees, pianted this season, aiso coming along weil. Prune crop wiii be iight as there was a heavy crop last year and frost has done some damage, but too early to state how much.

Almonds will aiso be shy from the same cause, except on the higher lands.

Cherries, apricots and peaches are used iocally and of no importance commerciaily.

Appies all right at present and majority not yet in biossom.

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill into the soil 110 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%. Send for Circulars No. 6 and 7.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 degree BE., etc., Fungicides and Insecticides.

Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR CO.
624 California Street, San Francisco, Cal.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET"; also booklet "NEW USES FOR SULPHUR" Price-list and Samples.

Ask us for prices for Carbon Bisulphide, the surest remedy for destroying ground squirrels.

Make Your Valuable Orange Crop Safe From June Drop and Fungus

Are you sure there is no Black or Citricola Scale in your grove, sapping the very life out of the trees that are setting what will be a burdensome crop?

Investigate for your own good. One Black Scale will produce 2000 to 3000 more, quickly spreading to healthy trees. Left alone it retards the growth of the tree and injures the fruit, sometimes lowering the grade considerably.

You can thoroughly clean your trees and eliminate Black and Citricola Scale, Red Spider and Fungus, if you will apply

TIZIT SPRAY

There is a grove near you where TIZIT has done all we claim for it. Send for the name and address of the nearest TIZIT SPRAY user so you can see the results.

The sooner you put TIZIT on, the more work it will do. The genuine TIZIT is labeled TIZIT—Trade Mark Registered.

Folder sent on postcard request.

The Tizit Spray Manufacturing Company

1344 Willows St., Los Angeles, Cal.

Also may be ordered through The Fruit Growers Supply Co.

General Motors Trucks

Answering the Question "What Truck Shall I Buy"

When you have decided that you need a motor truck you are faced with the question:

What truck shall I buy?

After the matter of capacity has been considered—a matter which will depend on your work—your choice should be based on just one big point—one which means more to you than anything else.

From your point of view, the truck that can be depended on to stand up and keep on running is the one that will, by all odds, serve you best.

GMC Trucks have been built for years with this ideal in view—that they shall make for themselves a reputation for absolute dependability.

And that reputation is established; it is becoming more notable every day.

In GMC Trucks there is real, honest quality —*built in at the GMC factory.* And you can't get more out of a truck than the manufacturer puts into it, no matter how hard you may try.

Ask for a copy of our free book (C) "Motor Trucks on the Farm"

GENERAL MOTORS TRUCK COMPANY

PONTIAC, MICHIGAN

Branches, San Francisco and Los Angeles (638)

Santa Paula Chronicle, Santa Paula, Ventura County, Edith Bristol

Regarding the aspect of the local apricots for the coming season, I have interviewed W. L. Ramsey of Santa Paula, who is considered among the best authorities in apricot matters, who says:

"The apricot crop of this locality will be about 50 per cent of the normal crop, in my opinion; some buyers and growers say 35 per cent, and in some parts of the county, noticeably those portions which have been short of rainfall for two consecutive seasons, there may be no more than 35 per cent of a normal crop; hut taking Ventura County as a wbole I should say that 50 per cent of normal is a fair estimate.

"Some orchards have a heavy setting of fruit of superior quality, bringing up the average for those parts of the county in which the fruit shows poor in quality and scarce in quantity."

I have not had time to question authorities in regard to the other crops you mention. Suggest that Ojai is a better locality than this for information concerning apples, cherries and almonds, as we have more citrus trees and nuts in this immediate section.

Lester C. Reed, Simi, Ventura County

The apricots in the Simi Valley are so spotted it is hard for anyone to make more than a guess as to what the harvest will be. Apricots bave been blossoming for the past six weeks with some still coming. Some of the earliest were killed by frost. The rain got some of the later bloom and we cannot as yet say what this late hlossom will do. It is the most peculiar season I have seen in my 14 years experience. I am sure the crop won't be over 50 per cent of normal, and may be quite a lot less.

California Prune and Apricot Growers' Inc., San Jose, H. G. Coykendall, General Manager

On prunes we feel it is entirely too early to make any accurate predictions as to crop conditions. We find that there is a good deal of thrips damage in different spots throughout the state, just to what extent we are not prepared at the present time to say.

On apricots we find that some districts have been very materially hurt by the rain during blossom time and that others are showing the damage from frost. We think tbe Santa Clara Valley district has suffered considerably as a result of the rain during the time the trees were in bloom and we know that in different districts frost has taken considerable of the crops. However, we feel that a conservative estimate would be about 75 per cent of last year's crop. Should you be interested a little bit later on in hearing wbat reports we have from our field men, we would be more than glad at all times to give them to you. However, as stated above, it will probably be a couple of weeks before we can make any accurate prediction as to the prune crop.

C. G. Marchus, San Pasqual, San Diego County

Apricots are almost a failure in this section. Some trees contain one-fourth crop of half grown cots and at this writing contain some blossoms. Some trees have large cots but hardly any leaves as yet. In 25 years have never seen the conditions which obtain this year. The Cultivator is giving good service in getting these reports.

E. M. Thompson, Fruit Crop Specialist, U. S. Bureau of Crop Estimates

California, the leading peach producing state of the Union, promises a bumper crop again this year. Last year California produced over 16,000,000 bushels of peaches and over 50 per cent of the United States commercial production. Nearly 90 per cent of California's crop, bowever, is normally canned or dried.

Ernest W. Curtis, Tehama County Agent, Red Bluff

Frost injury to fruit crops in Tehama County has been very serious. In tbe district around Red Bluff and Los Molinos the almond and apricot crops are practically wiped out. Corning district was not quite so badly injured but will not have much over 25 per cent of either of these fruits Elberta peacbes were badly damaged and the crop will run between ten and 25 per cent. Muir peaches got off a little easier, but the crop will he far below normal, probably 60 to 75 per cent.

O. E. Bremner, Horticultural Commissioner, Sonoma County

Almonds: About 50 per cent (hetter than last year).

Apples: Too early. Gravensteins look normal, 100 per cent.

Apricots: No crop. 25 per cent.

Cherries: Blooming heavy. Too early to say.

Peaches: Fair bloom, not so good as last year.

Prunes: Fine bloom but late; have not set.

Plenty of moisture, so that we may have normal crop of major products. Little early to say.

Fairbanks-Morse
"Z" Farm Engines
FAIRBANKS-MORSE QUALITY
F M
100%
KEROSENE
now takes the place of distillate and the "Z" Engine owner can use it just as efficiently. The "Z" is designed for kerosene and operates on gasoline as well. Over a quarter of a million farmers have proven "Z" superiority.
This rare combination of scientific design and construction—efficient operation—right price—successfully answers every farm engine need.

POISONING SPARROWS

The office of pest control, California department of agriculture, says:

Sparrows and linnets are easily poisoned. From all information available on the suhject we gather that cracked wheat is probably the best hait. This material can be obtained at any store handling poultry foods and is preferable to whole wheat, being cheaper and also smaller, therefore more readily eaten by small birds.

Accustom the birds to feed regularly at some open place in the orchard by distrihuting the bait (cracked wheat) freely for several days until it is noticed that a large number of the birds congregate there at feeding time.

Take one-eighth of an ounce of strychnine sulphate, dissolve by boiling in one pint of water, and add two teaspoons of gloss starch or wheat flour, stirring until the mixture tbickens. Pour the mixture over one quart of the wheat and mix thoroughly. Distribute the poisoned grain in the same manner and at the same point where the birds were baited and are used to feeding. As it takes from six to eight grains to kill a hird, the number in the flock will determine the amount that should he mixed and distributed. Care should be taken to keep poisoned grain, etc., out of reach of children, irresponsible persons, livestock and poultry.

FRESNO COUNTY WILL FIGHT WATER HYACINTH

An infestation of water hyacintb in the Centerville bottoms was recently explored by Fred P. Roullard, horticultural commissioner of Fresno County, and Ethelbert Johnson of the state department of agriculture, at the instance of Director G. H. Hecke. The report of the investigation shows the plant to lie in at least one of the sloughs in this vicinity. It extends down the slough for about a mile. This slough leads directly into the Kings River, and while the channel is much divided and the flow sluggish, in a season of flood it is extremely probable that the plant will be carried into the main channel of the river.

SHIPMENT OF NITRATE

During January, 1920, the production of nitrate of soda in Chile was a little more than 200,000 tons, but the exports were over 450,000 tons, the heaviest month's export ever known in the nitrate trade, and more would have gone out but the rail facilities are very poor, having only narrow gauge tracks with small cars. The association which handles nearly the entire output reports that European orders for 1920 delivery, largely from Great Britain, total over a million tons. The latest consular reports are that the available supply will last for several months, but the increased demand is causing the opening of works long closed and new fields will douhtless be developed.

DANISH POTATOES

The United States consul at Copenbagen reports on February 14 that about 90,000 tons of Danish potatoes are available for export. We quote: "A shipment of 10,000 tons is heing sent to Great Britain, but it would seem that most of the supply would eventually go to America if the favorable rate of exchange continues."

The Real Meaning of *"Best in the Long Run"*

"BEST IN THE LONG RUN" is a slogan that is almost as old as the history of tires. It grew out of the performance of Goodrich Tires on bicycles, and it grew into the *dependability* of Goodrich rubber products of all kinds.

It is not just a catch phrase. It is a plain statement of fact. It is really a mirroring of the confidence placed in Goodrich products by their users.

In five words it crystallizes the ideals, the policies, the principles of Goodrich.

It means "the long run" of good faith and good will—the steady building up of a confidence in the minds of the users, *which is the greatest asset a manufacturer can have.*

That is how Goodrich translates this slogan into terms of longest average wear, utmost dependability and known quality in all kinds of rubber products.

Water Right

I own land crossed by a ravine down which flows water from an irrigated orchard above and also a large volume of waste water from power house The power house water may be thrown some other way next season, although part of it may remain. If some of this water remains there, can the water company charge me for what I use although I can show that there was enough of the orchard waste water for my use running in the ravine prior to the erection of the power house? Can I use this water for operating a water wheel or for any other purposes? Should I file a claim for this water right? My neighbor above is also pumping and claims that he has a right to deprive me of my water because he pumped a year before I did. The ravine is not on his property, although a few yards distant. Can I prevent him from pumping when no more of the power house company's water is left in?—Subscriber, Newcastle.

The courts have held in two late well considered decisions that where water escapes or leaks from or where the producers abandon it, as in this case, and it flows promiscuously over the lands or finds its way to some other stream than the one from which it is diverted, anyone may appropriate such water, but by such appropriation he takes the water only, that is to say, the original owner of the ditch or artificial water course is at liberty at any time to change or alter it without invading any vested right of the appropriator, even though the effect of such change must deprive him of the water which he has appropriated and used, perhaps for a long period of time. He does not, therefore, procure any right to have this water escape in the way it does as against the original owner. So in the above case the operator of the power house would be fully entitled to change the course of the waste water and the owners of the orchards could use their water fully so that no waste water could come. But this waste water may be appropriated just as though it was an original development of water, saving at all times, of course, the rights of the original owner to fully use it. In a late case the exact point has been clearly decided that such waste water belongs to the person first actually appropriating it rather than to a mere riparian owner. By actual appropriation of the orchard waste water, the person so appropriating it could not be obliged to pay anything whatsoever to the water company, as it has no interest in the orchard waste water. What interest the company has in the power plant waste water is not stated. In the event of any contest with the water company, if they have an ownership in the power company water, it would of course be necessary to prove the amount of orchard waste water flowing down the ravine which was actually put to a beneficial use and would be entitled to receive that amount without payment. As between your neighbor and yourself it would probably be best for you to file an appropriation in the usual way, but the usual rule is that the first one actually appropriating and making use of water has the first right thereto. Sufficient facts are not stated with respect to the priority between your neighbor and yourself to enable a definite opinion to be given in respect to whether or not he would be entitled to deprive you of all of the water. The general rule, however, is that a prior user who has not made an appropriation of water can claim only that amount which theretofore he actually took out of the stream and placed to beneficial use. Consequently he would be entitled to receive only that amount which he placed to an actual beneficial use during the year prior to the time when you commenced pumping. As this character of water belongs to the first actual appropriator it is posible that you would not be able to prevent him, although that would depend upon the exact situation between you and your neighbor, the facts of which are not given.

Horse Trading

A man traded a horse with me and said it was gentle. The next morning when I drove it, it ran away and threw me out of the buggy and broke two ribs and I was unable to do anything for a long time. I took the horse back to the man from whom I obtained it. Can I demand payment of doctor's bills and damages?—Subscriber, Fresno.

One who sells personal property, knowing that the buyer relies upon his advice or judgment, thereby warrants to the buyer that neither the seller nor the agent employed by him in the transaction knows of the existence of any fact concerning the thing sold which would to his knowledge destroy the buyer's inducement to buy. There is, however, a diversity of opinion as to whether personal injuries due to defects warranted against are an element of damage, although it is generally considered that where such personal injuries must have been the natural and direct result, as where a dangerous article is sold as safe for use, the warranty is in effect a warranty that the article is not dangerous to use and it has been held that damages for personal injuries are recoverable. Generally damages may be recovered if the defects warranted against result in injury to the buyer.

Compulsory Schooling

To what age are children required to go to school? I understand that when a child finishes the eight grades of grammar school, he is released.—Subscriber, Fresno.

Unless excused by reasons hereinafter given, everyone having control or charge of any child between the ages of eight and 15 shall be required to send such child to a public school during the time in which said public schools shall be in session, except in such cases where the board of trustees may be satisfied that the child's bodily or mental condition is such as to prevent or render inadvisable attendance upon school, for which a physician's certificate shall be taken as satisfactory evidence or where such

We Match Your Power

There is a Ross Ensilage Cutter that will exactly match your power whether a "four-horse" gasoline or kerosene engine, a tractor or heavy-duty steam engine. And no matter what model you choose, you'll get a cutter that will give you better silage; one that will go through any job of silo-filling without choking or chattering—at low speed and at low power cost.

ROSS ENSILAGE CUTTERS

The Ross special Ball-bearing End Thrust and Extra Knife Adjustment holds the knives right up against the shear-bar—*all the time*—assuring clean-cut silage with all the rich corn juices retained, instead of silage that is "chewed" and torn.

Study the Ross carefully. Note the Six-Fan Blower, Wish-bone Steel Mounting, Self-conforming Bearings, and, on the Flywheel Type, the genuine Rockwood Fibre Pulley which absolutely prevents belt slippage and gives you maximum power.

Write today for free literature and name of nearest Ross Dealer. Get all the facts about this highest-quality cutter which matches your present power, operates at lowest cost *and cuts clean*—always!

The chief cause of engine troubles—sediment in inferior oil

How black sediment in ordinary oil ruins engine efficiency

WHEN your passenger car breaks down repeatedly or your trucks and tractors are laid up for repairs and goods are held for delivery

—when repair bills mount up

—that's when you want to know what causes such common engine trouble.

Automobile engineers find that *90% of all engine trouble is caused by improper lubrication.*

Unseen damage day by day

Ordinary oil breaks down under the terrific heat of the engine—200° to 1000° F. A great quantity of sediment forms which has *no lubricating value.* The oil film is destroyed. Metal-to-metal contact results. Friction and wear begin. The engine overheats. Bearings burn out. Carbon forms rapidly. Serious trouble inevitably follows.

Ordinary oil after use — Veedol after use

Sediment formed after 500 miles of running

How Veedol solves the sediment problem

Veedol, the lubricant that resists heat, reduces the amount of sediment formed in the engine by 86%. Notice the sediment test above.

Veedol maintains the piston seal, preventing leakage and contamination of oil in the crankcase. Common engine troubles are almost eliminated. It also reduces evaporation between 30% and 70%—giving long mileage per gallon of oil.

Buy Veedol today

Drain oil from crankcase, wash out with kerosene, then fill up with Veedol.

A run on familiar roads will show you that your automobile or truck has new pickup and power.

Leading dealers have Veedol in stock. Every Veedol dealer has a chart which shows the correct grade of Veedol for your machine. The new 100-page Veedol book on scientific lubrication will save you many dollars, will help you to keep your engine running at minimum cost. Send 10c for a copy.

child is being taught in a private school by private tutor or at home by a person capable of teaching in such branches as are taught in the primary and grammar schools of the state, or where a child between the ages of eight and 15 has been given a permit to work in accordance with the act prohibiting the employment of minors under certain ages, or in case no public school is located within two miles by the nearest traveled road of the residence of the child, or in case the child has completed the prescribed grammar school course, in any of which cases it is the duty of the board of education upon application of the person having control of said child to excuse such child from attendance, or if the person having charge of said child presents by affidavit proof that he is unable to compel the child to attend school, then the child is deemed to be a truant and subject to assignment to the parental school in the jurisdiction of the truant officer. Any parent, guardian or other person having control or charge of said child who shall fail to comply with the provisions of the act shall, unless excused or exempted therefrom as hereinbefore provided, be deemed guilty of a misdemeanor, the punishment for first offense of which is a fine of not more than $10 or imprisonment for five days, and for any subsequent offense not less than $10 or more than $50 or imprisonment for not less than five or or more than 25 days.

Damage by Domestic Animals

A neighbor's dog (I think) killed 30 of my rabbits. I have now set a trap to catch him alive. If I catch him can I kill him and how can I make the owner pay for the rabbits already killed?—Subscriber, Riverside.

If domestic animals injure property while wrongfuly in the place where the injury is done, the owner is liable although he had no notice that such animal was accustomed to do such wrong. A cause of action arises therefrom to the owner of the property injured against the owner of the animal, and it is not necessary to allege or prove on the part of the owner that the animal had previously been vicious. The value of the property damaged should be recovered, but it is well settled that the mere trespass of the dog will not justify a land owner in killing it. If he should kill it, he is liable to the owner of the dog for the value thereof and might probably incur criminal liability for malicious mischief. It is only where the dog is caught in the act of injuring property and it is necessary to save property which is of prohably more value than the dog or to save the person from injury tnat anyone is justified in killing a trespassing animal.

Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Spring Snowflake

A bulbous plant in an old flower bed has small white, bell shaped flowers with a green dot on each petal. It flowers quite freely in March and April. Can you tell me what it is?—Subscriber, Covina.

From your description we judge it to be Leucojum vernum, the spring snowflake, a member of the amaryllis family, native to Europe.

Blackberry Pruning

Last year we planted some blackberries which are now in full bloom and strong new shoots are coming up. Should these be cut out?—Subscriber, Oxnard.

The hest berries are grown on the young wood. Do not cut any of this out. It is best, for the home garden, to pinch the end or terminal growth off with the thumb and finger so they will not grow longer. This is done when they are at any length, according to system of trellising, usually from two to four feet. This pinching will cause them to throw out lateral branches and these may be pinched off at a foot long. This will result in the heaviest crop. In hig plantations these growths are allowed to become woody and are slashed off with shears or hooks, but for home garden vines are best pinched off while soft.

May in the Ornamental Garden

Northern California

By A. R. Gould

THE month of May should be gay with flowers as many annuals will be in bloom. Last month we gave a list of useful flowers to grow for the season, naming varieties of gladiolus, dahlias, liliums and carnations, and we advise those who contemplate a long season's display to secure these subjects as it will more than pay.

Some Popular Annuals

These we shall divide into two groups. The first will comprise those it is advisable to sow in their flowering quarters. They are: Clarkia; mignonette; evening scented stock; lupins; nemophila insignis; phacelia; poppies, Shirley, single and double annual; cardinal, double fringed, carnation, peony flowered; dimorphotheca and Bartonia aurea.

For transplanting sow asters, Semple Cregos, giant pink, rose, lavender, purple; astermum, single types in blue and rose; ageratum; agathea; candytuft, zinnia; larkspur; marigold, French and African; lobelia; nemesia; pansies; phlox Drummondi; snapdragons; sunflowers, stocks and verhenas. These will all flower satisfactorily this season if secured at once.

Plants for Ground Cover

Many people have banks and much bare ground to cover and often it a problem. For covering these we recommend coprosma Baueri, hypericum Moserianum, ivy geranium, English ivy, mesembryanthemum, evergreen strawberry, gazania, vinca minor, honeysuckle, halleana and lippia repens. These will thrive on most ordinary soils. They may be secured from your nurseryman.

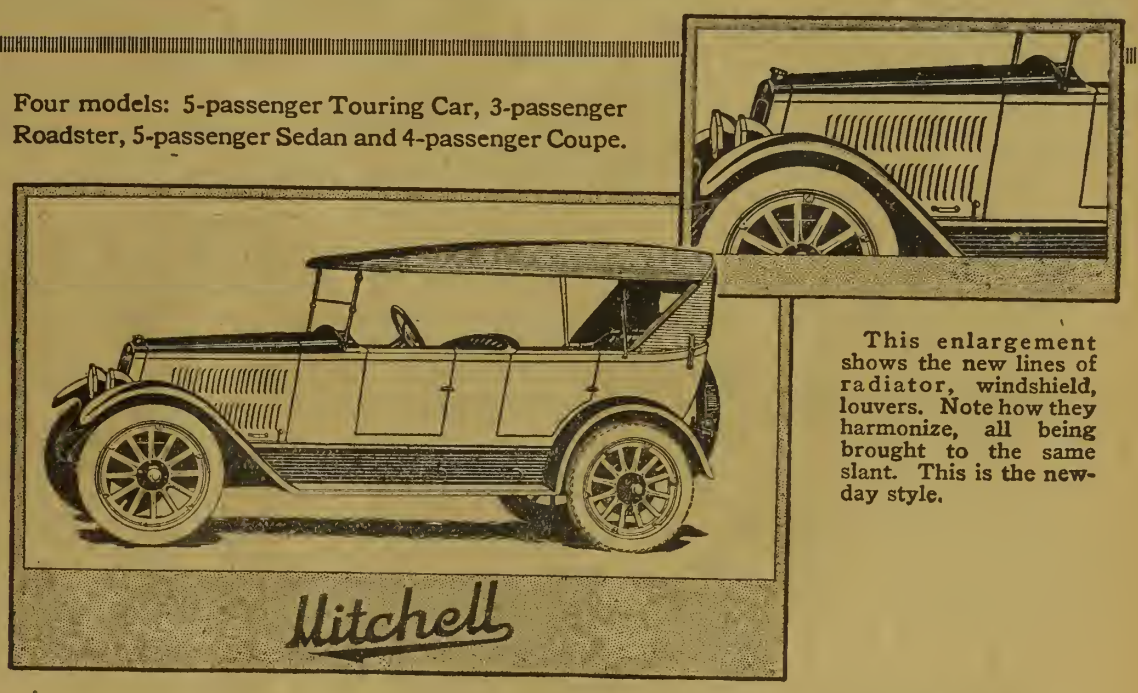
You save much in first cost

and upkeep when you choose the New Mitchell

Four models: 5-passenger Touring Car, 3-passenger Roadster, 5-passenger Sedan and 4-passenger Coupe.



This enlargement shows the new lines of radiator, windshield, louvers. Note how they harmonize, all being brought to the same slant. This is the new-day style.

The new Mitchell Six challenges comparison. People marvel how we can afford to give so much.

The secret is that we have learned how to put in over-values by making countless savings in manufacture. For example, Mitchell is one of the very few makers that builds bodies. Thus we save the profits to outside body-builders. That saving goes into the car.

Throughout we build for strength, durability, lasting newness. Every item is finer. For instance, the top is hand-tailored, to insure its shape and finish. Examine every item, note that no car of equal price offers so many.

This new Mitchell is a 14 year development, the climax of a master-group of builders. You cannot afford to decide upon *which* car, until you have investigated it, until you know how much more it offers for your money. We invite comparisons.

The new Mitchells can be seen at the nearest Mitchell Dealers, or we will be glad to send our latest catalog, describing our new models in detail.

But don't delay getting acquainted with this new car at once. Then place your order early so as to insure early delivery.

Southern California

By Ernest Braunton

THE merry month of May is not a time of planting, though with late and copious rains the past April became a normal March with consequently belated planting. Therefore we may assume many have been delayed in gardening operations and now would plant of things usually disposed of in April.

Owing to cool weather we should still find plump bulbs of amaryllis, begonia, canna, cyclamen, dahlia, gladiolus, tigridia and tuberose. All will flower if put in ground at once, but cyclamen should go in a cool, shaded spot. It is still early to take up spring. flowering bulbs, but later in the month beds of narcissi and other bulbs should be yellowing in the tops and drying in the bulbs, so they may be removed

It is better not to closely clean these of soil now; leave such work for the replanting season when the clumps may also be divided. A good curing plan is to put all freshly dug bulbs in damp sand, place in a cool, dry place, and the bulbs will slowly become dormant as the sand dries. If sand is not available, sifted soil will do. This process results in bulbs retaining much more vigor and recuperative power than when dried hastily.

Seed Sowing

Seeds sown now will need closer care than those sown earlier. True, they will respond more quickly, due to increased temperature, but they will also burn more quickly or die from lack of soil moisture. Either lightly shade the seed beds during the heat of the day or water often and lightly.

Annual carnations, calceolaria, cosmos, coreopsis, candytuft, centaurea, foxglove, gaillardia, marigold (African), nasturtium, phlox, petunia, poppy, primula and scabiosa may still be sown, but calceolaria and primula should be sown in the house or a place well protected from heat. Nearly all those listed will germinate a larger per cent if sown or kept in partial shade.

Rains were late and sufficient this spring so that lawns have not dried out nor has grass been as vigorous as in hot, early springs. But when warm weather comes lawn grass needs much water, as it grows faster than in any other month. See that the water goes deep so new roots will reach down so far that grass will not wilt if unwatered for a day or two. Lawns merely sprinkled on top every day will need daily care throughout the summer for the spring rooting will be made near the surface only.

Chrysanthemums and carnations may both be planted now and both will need to be pinched or cut down to avoid spindly and too forward growth. Both these are cool weather flowers and should not develop blossoms until November. Possibly some 'mums may be allowed to bloom in late October, but carnations are best in December. Keep buds picked off from carnations until that time, for two reasons: First, because hot, dry weather dwarfs and burns the blooms, and, second, because the vigor should go into the plant and build it up so it may better yield good blooms in proper season. Both 'mums and carnations are gross feeders and must not at any time suffer for water or stems will become hard and permanently restrict growth.

Southern Arizona

By M. E. Bemis

AS in the vegetable garden, the number of varieties of plants which may be started is small among the flowers. Cosmos, a tender annual, with fine cut feathery foliage and large showy blossoms, is one of those which may be planted in May. The red flowered, or giant types, which grow five to six feet high, are best for this section. These produce handsome cut flowers and are easily grown and should be grown more extensively. There are two distinct varieties, the crimson and pink, also the mixed colors.

The zinnia also may be planted any time during the summer. These add to the beauties of the flower garden and should be cultivated wherever there is a vacant place.

It is not yet too late to plant castor beans, and where quick shade is needed these serve their purpose.

The running vines, such as balsam. may also be planted during May.

May in the Vegetable Garden

Southern California

By D. F. Reichard

MAY is here. The time for looking out for weeds, bugs and disease among your plants is also here. The fine rains of the last two months have given the weeds and grasses a new lease on life and they are taking the substance and moisture out of the soil as fast as they can where they have not been properly controlled. Besides being robbers, weeds harbor disease and insects. It is certainly depressing to see potatoes or corn trying to grow in a poorly plowed field with weeds running a winning race with the intended crop, whereas had the would be farmer taken the pains in the first place to have turned the weeds under properly and harrowed the ground, then waited a couple of weeks for the weeds to decay, then worked the ground over again, if only with a cultivator, he would get rid of most of his weeds and his ground would be in good shape for planting, and with little care would return a good profit.

For good garden results the plot should have been worked up some time ago, but for those who have not been able to get their garden started until now it should be given a thorough working up with incorporation of as many of the weeds as possible. Then soak it well and cultivate and your ground should be in fair condition for planting.

There seems always to be an impulse to put in potatoes. Do not do it for the next three months—conditions are not right for potato growth and development at this time; the yield will not justify the effort. The same may be said of peas. This is, however, the ideal time for planting all the more tender summer crops such as melons, cucumbers, casabas, corn, beans, roselle, pumpkins and squash. Put out plants of tomatoes, peppers and egg plant.

In the gardens that are under way it is well to look around to see if some of the stuff planted last January and February is not ready to be used. Pick stuff while it is young and tender. It is so much more pleasing to the palate than the stuff grown in a commercial way. Watch for aphis or other insects that might be about your plants. Keep a small quantity of Black Leaf 40 on hand for aphis and dry arsenate of lead for worms and other chewing insects. An application of these at the proper time will save your garden. Thin out the melons, cucumbers and squash planted last month to two or three plants to the hill; it makes stronger plants and they will yield better. Watch stuff that it does not want for water. If we don't have an occasional rain, irrigation will have to be resorted to.

Southern Arizona

By M. E. Bemis

THE list of crops which may be planted in May narrows down to a comparatively few things. This does not mean, however, that garden activities should cease during this month. The crops already planted and maturing need attention. Those which are growing need constant cultivation and watchful care. With the coming of warm weather there is a growing need for more frequent irrigations and each irrigation should, for best results, be followed by cultivation. The dust mulch is the ideal condition for the garden during the heated period which may be said to begin with May. There is no use in planting such things as beets, carrots, lettuce, etc., during the summer months; the seeds will not germinate.

Casabas, pumpkins and squash may be planted in May. The casaba is probably a hybrid of the muskmelon and watermelon. These follow the cantaloupe and mature on through the fall, taking the place to some extent of cantaloupes and watermelons, and are, with a great many people, a very popular melon. They should be planted the same as the cantaloupes. Casabas are at their best when allowed to become very ripe. The rind of casabas is very hard and they should be kept until they are mellow. There are several varieties. The winter pineapple is perhaps the most popular. This is a large green fleshed melon with corrugated skin and a decided pineapple flavor.

The ordinary varieties of summer squash, as mentioned in last month's garden calendar, or the common varieties of pumpkin, may be planted during May.

Another crop which may be planted in the garden or field, and which is deserving of more attention than is usually given, is peanuts. These do exceptionally well in the lighter soils, and, considering their food value, both for home consumption and for hogs, they should be grown far more extensively than they are.

The large Virginia Bunch has proven to be the most popular and yields the best of any varieties grown in Southern Arizona. It has been sometimes stated that two crops of the Spanish variety might be raised in the same season. Very likely this would be true under exceptional conditions, but these exceptional conditions have been found to be impracticable for growing these on a commercial scale, so that those who have had experience are practically unanimous in their statements that the Virginia Bunch is the best peanut for this section of the country. They should be planted in rows 20 inches in the row and the rows three feet apart. About ten pounds of shelled peanuts or 15 pounds of unshelled are required to plant an acre. The ground should be ridged just enough to provide for a small irrigating stream between the rows.

It is the common practice to throw the earth towards the vines so as to assist in burying the blossoms which contain the fruits, which appear in the form of pegs. Where the ground is very mellow these shoots or pegs will bury themselves in the soil of their own accord, but great care should be taken to have plenty of loose earth so that this effort of nature is aided rather than impeded.

After the nuts have formed it is very important that there should be sufficient irrigation to keep them growing and thus enhance the crop and hasten maturity. A shortage of water at the critical time in the heated period results in a crop of empty shells. Two or three irrigations a month will be required. The land should be cultivated after each irrigation, as long as it is possible to get between the rows. Gradually throw the earth towards the vines. Fortunately this crop is not molested to any considerable extent by insect pests.

There are a number of field crops which may be planted during May and some of these might well be used in the garden to occupy otherwise vacant ground, or in some cases to serve as a cover crop. Cow peas serve this purpose admirably. As a strictly commercial crop it is possible that cow peas have considerable value. These are sometimes sold in the Phoenix markets in a green state and are not an unpalatable dish.

The grain sorghums may be planted and as these furnish a considerable amount of grain they are a profitable crop to produce, providing the land is not needed for some other purpose before maturity. These grain sorghums include feterita, kafir corn, hegari and milo. The shallu, or Egyptian wheat, while it makes a splendid feed for chickens, is not grown to any extent in Southern Arizona, although for a few seasons it was very popular. More recently it has been entirely supplanted by the grain sorghums mentioned above. Hegari was grown in the Salt River Valley to a very large extent this past season and it is somewhat questionable whether or not this is of more value than the milo. My personal observations lead me to believe that the dwarf milo is the best of the summer crops for this vicinity. Two varieties have been grown here from selected seed and either one of these is of great value and is far superior to any seed which can probably be brought in from any other section. One of these varieties is known as the Avondale. This has been selected for its head qualities without so much regard to type of plant. Selections of this have been made for a number of years and have been grown very carefully so that seeds show a marked superiority and yields are all that could be expected. The Stannard variety is a strictly dwarf variety which has been carefully selected by the Stannard family for the past four or five years. Only first class heads from a desirable plant which is typically dwarf have been used for seed purposes. Consequently a field of this variety shows remarkable uniformity. Both of these two varieties are most excellent.

Millet as a catch crop or a cover crop may be planted any time during the summer. Golden millet is the popular variety for Southern Arizona. It requires about 30 pounds of seed for an acre and matures quickly, but is available only as a catch crop or a cover crop. The sweet sorghums can also be planted at this season.

For a summer forage crop there is nothing that does better, so far as quantity and quality is concerned, than Sudan grass. This should be sown broadcast at the rate of 25 pounds to the acre.

Broom corn is a crop that brings high prices and costs but little to raise. The average price of good broom corn is around $250 a ton. The yield should be from one-third to one-half ton per acre. The best variety for this section is the Oklahoma Dwarf. The chief expense of producing broom corn is in curing the brush. This by good rights should be cured in the shade.

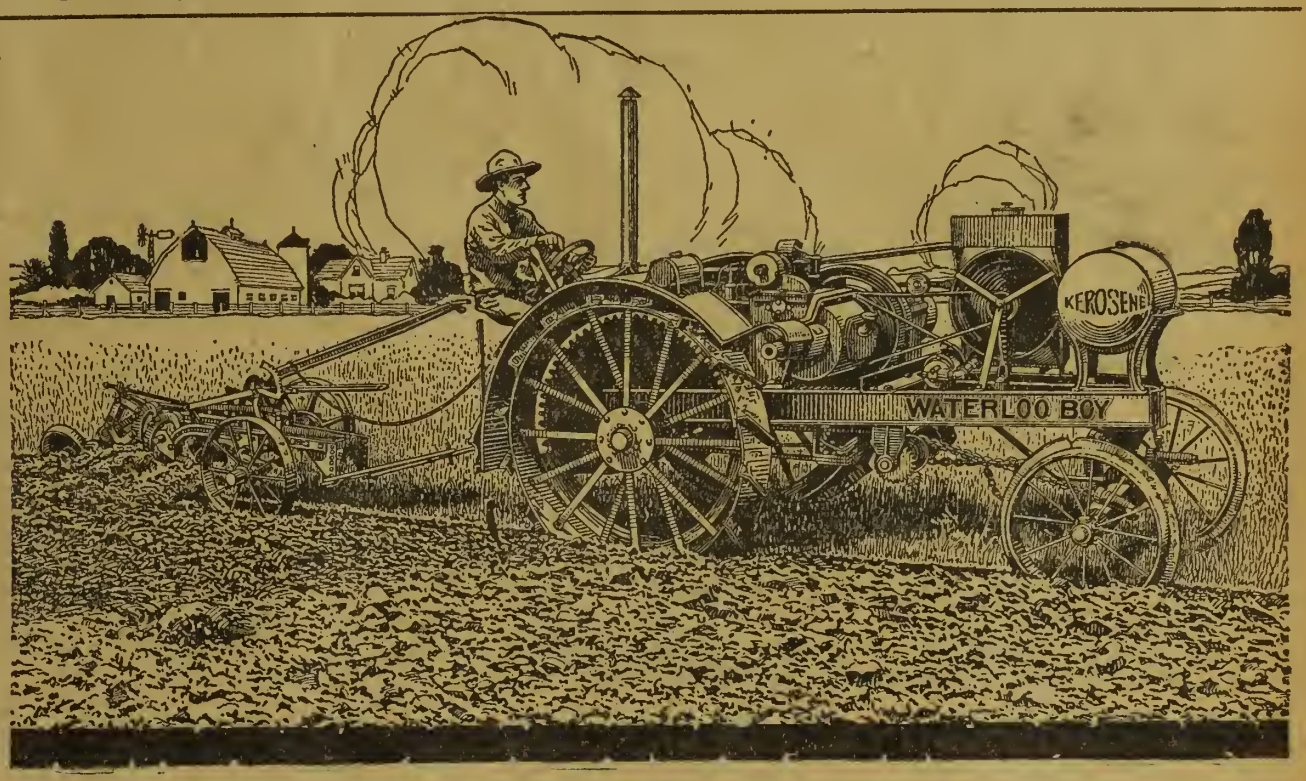
(Calendar for Northern California, Page 755.)

GROW A GARDEN

In these times of high prices every home should have a garden. It should be near the house. The housewife or her help cannot be expected to go far for products and they will often fail to use some if too much trouble to procure.

The home garden should grow all that the family desires in both fruits and vegetables. We must have fruits and berries of all sorts, and a great variety of the best vegetables. All these should be chosen with a view to seasonal supply, striving to use the extremes in both early and late sorts so fruits and vegetables may grace the table every month in the year.

You will be saved both time and money and have better products than you can buy, at lesser price, and if sufficient variety is grown one-half the table expenses will be cut off. Fruits and vegetables keep the system in good order and medicines are banished. Three-fourths of these drug store purchases are laxatives of some sort and all are unnecessary with a well balanced diet of vegetable oils, acids and other juices. To live long and live well the home orchard and garden is almost indispensable.—E. B.



Power You Can Rely Upon

To make you the most profit, each of your different farm operations must be timely. Often weather conditions call for extraordinary effort. It is then that you can count on the dependability and rugged power of the Waterloo Boy.

WATERLOO BOY
BURNS KEROSENE COMPLETELY

It gives you dependable service at small operating cost. Its twin-cylinder engine develops full 12 H. P. at the drawbar and 25 H. P. on the belt, using kerosene as a fuel. A patented manifold converts every drop of this low-priced fuel into power. Two gallons of kerosene per acre is the average amount used when plowing.

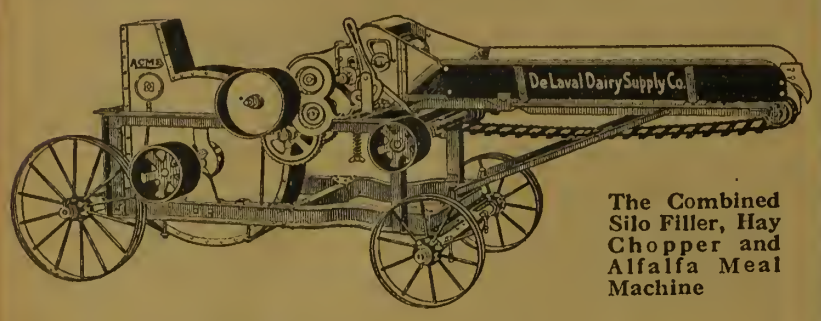
The cooling system always holds the engine at the proper temperature. While the motor runs at the right temperature for perfect lubrication, enough heat is maintained to insure complete combustion and full power. The radiator holds thirteen gallons of water. You don't have to stop in the field every few hours and fill it.

The Waterloo Boy is especially strong and rugged. Its various parts are designed to meet every possible strain. Every part is easy to get at. The engine runs without vibration. Its well-balanced weight provides proper traction in soft ground.

Buying a tractor is an important investment. We have a booklet describing the Waterloo Boy fully. Drop us a postal card or letter today. Address John Deere, Moline, Illinois, and ask for booklet WB-57.

JOHN DEERE
JOHN DEERE MOLINE, ILL
THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

Correct Type Superior Construction



The Combined Silo Filler, Hay Chopper and Alfalfa Meal Machine

The ACME Cutter

EXPERIENCE has proven that the cylinder machines far excel other types in capacity, quality of product and adaptability to varlous feed cutting purposes.

Your logical choice then, lies with the most durable and lightest running of the cylinder types. Study the construction of the Acme.

Note how the blower, the knives, the gearing and pulleys are set into and rigidly supported by the parallel steel frame members—two heavy channels on the outside at the bottom—three parallel steel angles at the top—all rigidly cross braced and securely riveted.

This sturdy construction, with three bearings for the cutter shaft, all bearings held in permanent alignment by rigid attachment to the steel frame insures a freeness from vibration and a degree of durability found in no other cutter manufactured.

OTHER VALUABLE FEATURES INCLUDE:

Build Up Your Soil With Whip-Poor-Will Cow Peas

WHAT THEY WILL DO:

They make the best summer covercrop.
Maintain a molst surface mulch.
Will prevent June drop.
Require less irrigation than other crops.
Need no irrigation where soil moisture has been conserved.
Build up poor soils with more nitrogen bacteria and humus than any other covercrop.
Afford the best kind of pasture for cattle and hogs.
As a hay have a food value of 43% more than Alfalfa.
Will improve your silage.
There is no better Bee Pasture.
Thirty pounds of seed is sufficient to plant one acre.
Our seed germinated 96%.

UNIVERSITY FARM PICNIC

(Continued from Page 730.)

they wanted. Preliminaries began in March with 54 students. The number was gradually cut down until 20 men qualified for the finals.

During the morning the visitors were accorded the freedom of the farm. Each department had provided exhibits setting forth their principal activities, and the instructors were on hand to answer questions and to explain the hundred and one exhibits. One could, with very little effort, gain a useful short course in agriculture. More and more the tendency seems to be to stress the many opportunities to get before the public the newest and best practices of our rapidly developing agricultural science, and picnic day seems to present the opportunity.

During the morning a meeting of the Sacramento Development Association was held. The work and plans of the association were outlined by W. A. Beard, the secretary. Of particular interest was his review of the present status of the much talked of Iron Canyon project. The secretary said that there was little doubt but that the project would be carried through. Guy Chick of Sacramento told of the efforts to construct a dam at the lower end of Suisun Bay in order to keep the salt water from menacing the rich delta section during times of low water.

Dean Hunt of the college of agriculture and Dean Van Norman of the university farm school told of the work of those departments. Dean Van Norman also spoke of the increasing difficulty in conducting the institution on the appropriations based on estimates of several years ago.

The institution is really facing a critical period. The number of students is growing rapidly and the calls upon the small force of instructors are making it very difficult to operate with efficiency. So serious has the situation become as regards the animal husbandry department that the livestock interests of the state are becoming alarmed and expect to make a strong effort to get increased support for that division. There is a growing feeling that a different plan from the present organization must be developed and put into practice if the college of agriculture of the University of California is to take a high place among the leading institutions of the kind. Expressions are freely heard on the part of students, faculty members and farmers and ranchers that the place for the college of agriculture headquarters is at Davis rather than at Berkeley. And when the suggestion is studied, it does seem that Davis is the logical place and that eventually such a move must be made. Certain it is that until that end is accomplished students and graduates are handicapped in the amount of real practical training that they are given. The idea that a semester or two at the farm, coupled with their training at Berkeley, is going to turn out as efficient graduates as is possible in institutions where the boys have four years of training on a farm is a proposition that admits of no argument.

At the noon hour everyone and his family ate their lunches, if mountains of fried chicken and the usual "accessories," ad lib. and ad infinitum, can be termed a "lunch," under the trees of the campus and along the banks of Putah Creek.

The big event of the day was, of course, the parade, and this year's parade was decidedly an improvement over former years. Aside from the magnificent livestock from the barns and paddocks of the farm, the many floats were most creditable and were conceived with the idea of really carrying a message.

During the afternoon the visitors were entertained with many athletic events. Several notable speakers, including Governor Stephens and President Barrows, addressed the visitors. A circus was staged by the students, and for those who were not able to get in the main tent there were a number of side shows. One large hall was given over to the young folks who wanted to dance, and many danced all afternoon and late into the night, for the big event of the evening was a dance.

This annual event is decidedly worth while. It serves in a most acceptable manner to bring the farming interests of the state in closer contact with the work of the institution. The strong features and possibilities of the school are made plain along with the weaknesses of the institution. If this year's picnic does nothing more than convince those most interested that if the most is to be made of the great opportunity for making available in the most efficient manner the possibilities of the school, it will soon be necessary to consider a complete reorganization of the college of agriculture, the event will be justified—besides furnishing a pleasant day of recreation for the thousands who attended.

BONITA HOLSTEIN CALVES SELL WELL

Satisfactory prices were obtained at the sale of Holsteins held at Bonita Stock Farm, owned by J. M. Henderson Jr., Sacramento, last week. The offering was notable in that it consisted entirely of young things and was the first sale of the kind ever held in this state. Buyers from a wide territory were in attendance and evidenced a strong demand for young breeding material.

The top price of the sale was paid by M. H. Cusick of Lodi for Bonita Pontiac Mystic, a yearling daughter of King Segis Pontiac Polkadot. Cusick also bought the top bull, Bonita Sir Glista Aaggie, a son of Supreme Glista Pietje and Willow Grove Glista Spofford.

C. L. Hughes of the California Breeders Sales and Pedigree Company managed the sale and Ben A. Rhoades of Los Angeles, assisted by J. A. Davis of Manteca, cried the sale.

The detailed list of sales follows:

FEMALES

1, Bonita Lyons Nudine, Oct, 1917, F. A. Faist, Franklin, $290.
2, Florrissy Lawn 2nd Bonita, Feb., 1919, J. R. Crawford, Burrell, $255.
6, Bonita Mooie Reka, Dec., 1917, F. A. Faist, $100.

HOME OF THE CHAMPIONS

Rhoades & Rhoades, livestock auctioneers, announce the complete dispersal sale of the Fred Hartsook herd of registered Poland Chinas. Sale will be at the Hartsook Ranch at Lankershim next Thursday, May 6. Rhoades & Rhoades announce this to be a complete dispersal sale without reservation of these pure bred hogs. Among the offerings will be winners of blues and championships at California state, Riverside, Fresno, Modesto and Los Angeles fairs. Among these is a grand champion junior yearling that was at the California state fair in 1918. Mr. Hartsook has spared no pains in gathering the herd that will make this sale true to name, "Home of the Champions." There will also be offered a number of registered Holsteins, including several young bulls. These are from some of the state's greatest butter makers. Amongst these are producers from 24 to as high as 37.34 pounds butter in seven days.

Dissolution of Partnership Sale

75 Registered Holsteins 75

An offering of highly bred cows, heifers and bulls of splendid individuality, and in fine physical condition

Leeman & Kilgore Farm, Ripon, Cal. Wednesday, May 12, 1920, at 10 A.M.

The dissolution of partnership which makes necessary this absolute dispersal sale affords an opportunity to buyers for the selection of breeding animals of rare merit considered from any standpoint, individuality, pedigree, production, and good health. Among the many splendid females will be found:

MISS GELSCHE WALKER KORNDYKE, daughter of Prince Gelsche Walker and a 29 lb. daughter of Korndyke Queen De Kol's Prince. At last freshening she made 32.76 lbs. butter from 708.9 lbs. milk in seven days, and is being carried on strictly official test up to sale day. In 90 days she has made 324.54 lbs. butter from 8,165.1 lbs. milk. As a junior two year old she mads 687.31 lbs. butter from 15,246 lbs. milk in 348 days.

FAYNE SPRING FARM PONTIAC DE KOL, a 26.30 lb. four year old daughter of the famous bull Spring Farm King Pontiac 6th. She is fresh and on test at this writing and promises to substantially increase her record. She is a beautiful individual and is one of the best bred young females to be sold in California this season.

MERCI PAULINE BURKE DE KOL, has recently completed a record of 29.18 lbs. butter from 535.9 lbs. milk in seven days, and she is a high class individual, sired by De Kol Hengerveld Burke.

A 25 POUND DAUGHTER of Segis Pontiac De Kol Burke, out of a 24 lb. three year old daughter of King Mead of Riverside.

A 27 POUND DAUGHTER OF A 28 POUND COW, bred to Sir Aaggie Korndyke Alcartra, grandson of Tilly Alcartra.

A DAUGHTER OF KING MORCO ALCARTRA out of a dam that made over 1,000 lbs. butter in one year and over 33 lbs. in seven days.

A 24 POUND GRANDDAUGHTER of Sarcastic Legislator, bred to King Gelsche Walker Korndyke, who is by King Morco Alcartra, son of Tilly Alcartra, and out of the 32 lb. Miss Gelsche Walker Korndyke.

A 24 POUND 3 YEAR OLD daughter of Karel Vale Cornucopia, bred to King Gelsche Walker Korndyke.

A 24 POUND JUNIOR 4 YEAR OLD daughter of Dutchland Colantha Sir Ormsby.

A 22 POUND DAUGHTER of Woodcrest Aaggie Jewel Son, bred to Sir Aaggie Korndyke Alcartra.

A 20 POUND 4 YEAR OLD whose dam is sister to two 1,000 lb. yearly record cows.

A YEARLING DAUGHTER of the above cow sired by King Morco Alcartra.

A 22 POUND DAUGHTER of Dutchland Hengerveld Sir Gladi, bred to King Gelsche Walker Korndyke.

A 19 POUND 3 YEAR OLD great granddaughter of King Segis, bred to King Gelsche Walker Korndyke.

A 16.81 POUND 2 YEAR OLD daughter of a granddaughter of King of the Pontiacs that made 850.33 lbs. butter from 18,712.1 lbs. milk in one year as a senior three year old.

A YEARLING DAUGHTER OF KING MEAD OF RIVERSIDE, out of a daughter of Korndyke Queen De Kol's Prince, that made 634.48 lbs. butter in one year as a junior two year old, her dam with 828.62 lbs. butter in one year.

A YEARLING DAUGHTER OF SEGIS PONTIAC DE KOL BURKE, out of a dam that made 801.08 lbs. butter in one year.

A 16 POUND 3 YEAR OLD daughter of Count Segis, bred to Sir Aaggie Korndyke Alcartra.

A 15.76 POUND 3 YEAR OLD granddaughter of King Segis, bred to King Gelsche Walker Korndyke.

A DAUGHTER OF KING KORNDYKE SADIE VALE 22ND, out of a 30 lb three year old.

A DAUGHTER OF KING SEGIS PONTIAC JANNEK, out of a 27 lb. four year old.

A DAUGHTER OF PRINCE GELSCHE WALKER, out of a granddaughter of King Segis Pontiac that made 549.53 lbs. butter in one year as a junior two year old.

DAUGHTERS OF OTHER GREAT SIRES, out of highly bred dams.

An Extraordinary Offering of Highly Bred Bulls

Besides the two royally bred herd bulls there are in this offering a splendid selection of young bulls, many of which are out of young dams that already have large records and that can be expected to increase them materially at later freshenings. It is a foregone conclusion that owing to the number of young bulls to be sold there will be some rare bargains. Following are some of the bulls in the sale:

SIR AAGGIE KORNDYKE ALCARTRA 194050, born Oct. 16, 1915. This is the senior herd sire. He is by Prince Alcartra Korndyke, the great son of Tilly Alcartra heading the J. S. Gibson Co. herd at Williams, whose daughters have made up to over 1,000 lbs. butter in one year, and over 31 lbs. in 7 days. The dam is Hazel Aaggie of Oakwood Daughter, with 860.91 lbs. butter from 21,208.5 lbs. milk in one year. She is now on yearly test again in the Gibson herd and promises to go right around the 1,000 lb. mark. The records of the dam and sire's dam of this bull average 1,096.58 lbs. butter and 27,316.6 lbs. milk in one year. Look over his calves in this sale and you will concede high merit to him as a herd sire.

KING GELSCHE WALKER KORNDYKE, born November 22, 1918, the junior herd sire. is by King Morco Alcartra, the great son of Tilly Alcartra in service in the Morris herd. The dam is Miss Gelsche Walker Korndyke, whose records have been fully set forth above. Six of the seven nearest dams of this bull average 30.56 lbs. butter from 692.9 lbs. milk in seven days. Three of his seven nearest dams average 1,031.56 lbs. butter and 25,832.4 lbs. milk in one year. Here is a high class individual of the richest breeding, and he is just ready for medium heavy service.

A SON OF KING MORCO ALCARTRA out of a 16 lb. two year old whose dam made 850 lbs. butter from over 18,700 lbs. milk in one year.

A SON OF KING MEAD OF RIVERSIDE out of a 27 lb. dam that made 589.92 lbs. butter in one year, second dam a 28 lb. cow that made 780.48 lbs. butter in one year as a four year old.

A SON OF SIR AAGGIE DE KOL ACME, son of the world's official record cow Aaggie Acme of Riverside 2nd, 1,331.78 lbs. butter in one year. The dam is out of a cow that made 520.12 lbs. butter in 305 days as a four year old, third dam with 646.97 lbs. butter in one year.

A SON OF KING MORCO ALCARTRA out of a 23.73 lb. four year old daughter of Prince Gelsche Walker that made 652.48 lbs. butter in one year as a junior two year old. Second dam a 31.91 lb. daughter of Korndyke Queen De Kol's Prince. Third dam a 23 lb. cow that made 701.53 lbs. butter in one year.

TWIN SONS OF IT, whose dam was the first cow to make over 1,200 lbs. butter in one year or 37 lbs. in seven days. The dam is a 15.76 lb. granddaughter of King Segis.

A SON OF SIR AAGGIE KORNDYKE ALCARTRA, out of Miss Gelsche Walker Korndyke, the great 32 lb. daughter of Prince Gelsche Walker.

A SPLENDID LOT OF YOUNG SONS OF SIR AAGGIE KORNDYKE ALCARTRA, out of well bred dams, many of them with good records.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER;
EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED

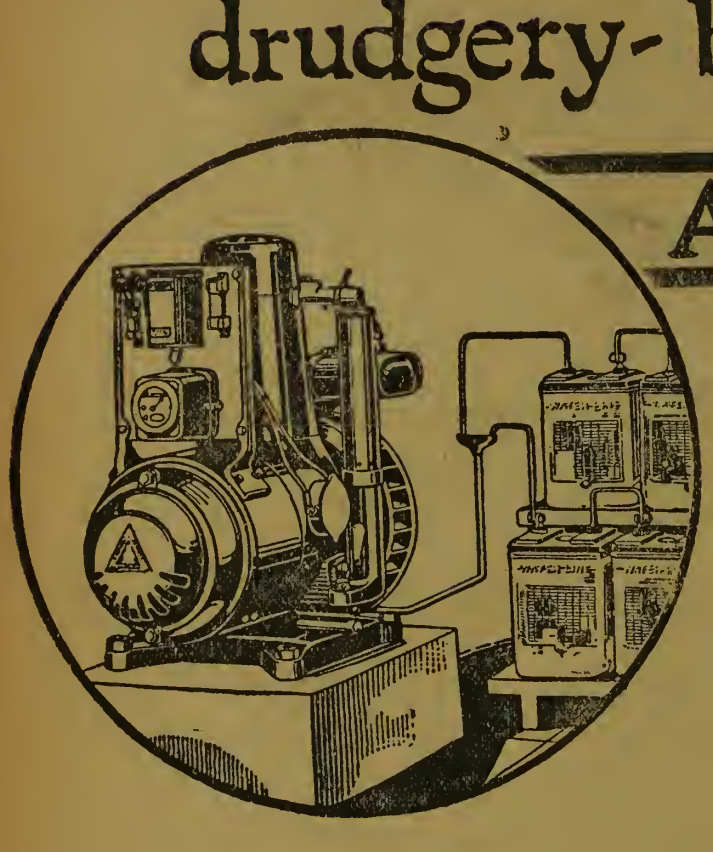
A TIME AND LABOR



A complete electric light and power plant for farms and country homes, self-cranking—air cooled—ball bearings—no belts—only one place to oil—thick plates—long-lived battery—runs on kerosene.

Among the 100,000 Satisfied Users Are More Than 3,000 on the Pacific Coast

When DELCO-LIGHT brought the first cost of an electric light and power unit within the means of every thrifty farmer, it performed a personal service TO YOU. You will appreciate this fact as soon as you install a DELCO-LIGHT—so why not act at once? Why not be among the 100,000 satisfied users who say that it is one of the triumphs of this electrical age? Without it, countless farms could not share in the blessings of electrical development. Country life would be no further advanced in this respect than in pioneer days.

From E. W. Slygh, Armada, Calif.—"The Delco-Light installed over a year ago has given perfect satisfaction. The fuel expense in October and November for lights and ironing was 70 to 80 cents per month. If I had to go back to using a lantern in the barn I should feel that I was one hundred years behind the times."

DELCO-LIGHT is as "good as gold" for any of the many tasks it is called upon to perform. But even gold is first tested for its worth. So, also, Delco-Light expects to be called upon to prove its merit to you. For this reason, it is sold on a money back guarantee. You can have Delco-Light installed in your home at once to make good in a 30-day test—and it will. But if you are not satisfied with the way it lights your home and outbuildings or with its labor-saving performances, it will be taken out without expense to yourself and your money will be refunded cheerfully.

From Cottage Garden Farms, McKinleyville, Calif.—"Our Delco system comes up to our fullest expectation. After tests and comparisons, I find the Delco system the safest, most economical and most compact lighting outfit made."

You want electricity as distributed by DELCO-LIGHT because of the increased health that comes to your household from constant, dependable brightness—because of the untiring help it contributes through its economical labor-saving devices. DELCO-LIGHT gives them to you at once. No waiting for power companies to find men and materials to put electricity in your home. No paying or waiting for transmissi

iron for fifteen minutes; or will drive an electric vacuum cleaner long enough to clean 450 square feet of carpet; or run a sewing machine or 12-inch fan two hours; or lift 100 gallons of water 100 feet; or run separator, churn, saw wood, clip horse, cut fodder, etc., at corresponding "penny cost."

From Bell & Canfield, Lompoc, Calif.—"About a year ago you installed our Delco-Light. We consider Delco-Light a number one investment as it saves us about $360 a year."

Don't go through another hot season without the comforts of DELCO-LIGHT electricity. No more hot oil lamps to draw the bugs and raise the temperature of kitchen and living rooms. No more dangerous, smoky lanterns in the barns. Instead, all the easy comforts of the city. A button pressed—and you have bright, clear lights to read and work by; electric fans to cool the house. No more fear of fire from exposed flame. No more dread of encountering pitchforks or sharp tools in the barns and outbuildings.

From J. L. Nagle, Sacramento, Calif.—"I am so proud of my Delco-Light that I am boosting it wherever I can as I am a firm believer that it has filled a long-felt want for the rural districts. My only regret is that I had not installed this plant years ago. It does the work of a main power line but with considerable less trouble and expense."

Write or call today on the DELCO-LIGHT dealer nearest you. Direct him to install a DELCO plant in your home at once on the money-back guarantee of a 30-day satisfactory test. Don't lose a day in the delivery of a light and power service that give satisfaction the moment you call on it. Remember, more than 3,000 DELCO-LIGHT plants have been sold on the Pacific Coast during the past four years with the above warranty—and not one has been turned back.

You, too, can start increased profits at once; add to the health and efficiency of every member of your household; stimulate labor production and get bigger returns with less hardships.

DISPERSAL

50 Young Registered Holsteins

30 Heifers 20 Bulls

State Fair Grounds, Sacramento

Saturday, May 29

This is a complete dispersal of the remaining stock owned by Henderson Company, all young things under milking age.

THE HEIFERS are mostly granddaughters of King of the Pontiacs, being sired by King Pontiac Segis Inka. They are a beautiful lot and many have high record dams.

THE BULLS are mostly sons of King of the Black & Whites, out of choice dams, and they are a most attractive lot of youngsters.

Write for Catalog.

Milking Shorthorns

May 5, Thos. Harrison, Santa Rosa.

Duroc-Jerseys

July 21, Elmer Lamb, Ceres.

Fred B. Ellis of the Sunkist herd of Lindsay, has just received his big new Duroc boar, Major Disturber, of Disturber-Pathfinder stock, which he recently purchased from Marco Hellman of Los Angeles. Ellis is getting his new herd sire in shape to put up against all comers at the state fair association circuit of shows this fall.

Beauty of Walnut Park is queen of the J. E. Wherrell herd of Jerseys at Riverside. She recently finished a record of 655 pounds of butter fat from 15,000 pounds of milk for one year's time. In addition she dropped twin bull calves that have been sold for $600. Gross returns for the year's production, $1,400. Beauty of Walnut Park is dam of Walnut Park Noble at head of Geo. W. Thomas & Sons' Golden Glen herd at Arlington.

Geo. W. Thomas & Sons at Arlington are now lined up with one of the state's good business herds of registered Jersey cattle. The official test is to gauge the capacity for production in this herd henceforward. Mr. Thomas is confident that he has Register of Merit material in abundance. There are 30 cows in the milking string just now showing a composite test above five per cent, not a few running above six and seven per cent. A notable accession to the Golden Glen herd is that of 30 females from Nevada.

Geo. V. Beckman and Sons of Lodi report a fine bunch of spring pigs. Ten sows bred to Lakeside Defender farrowed 101 pigs. The smallest litter was of seven pigs. These, with a bunch of fall pigs, will be shown at the coming fairs. One of the fall litters is sired by Liberty Bond, a great Missouri boar.

Greenwood Farms, Live Oak, report the sale of the junior yearling Duroc boar with which they won fourth prize at the 1919 state fair, to Everett Platter of Sutter City. The boar was a son of Johnson's Defender Jr.

At the sale of grade Holsteins held last week by the Stockton state hospital an average slightly above $150 was obtained.

Forty-nine carloads of livestock were shipped from Cottonwood, Shasta County, April 24. The value of the shipment was placed at $129,000.

Professor F. W. Woll of the animal husbandry division of the University of California has left for an extended trip to Denmark and other European countries to study the foreign dairy situation.

Much interest is being accorded the forthcoming sale of milking Shorthorns to be held at Santa Rosa, May 5, by Thos. Harrison. This will be the first sale of the kind ever held in the West, and owing to the prominence of the herd and the quality of the cattle it is expected that the event will attract buyers from a wide territory. During the last few years the interest in the milking Shorthorn has developed very rapidly in the West and a number of very high class herds have been established.

A pure bred Holstein calf club has been organized at Live Oak, Sutter County. The boys will start with about 20 calves.

The dates for the annual fair held at Anderson, Shasta County, have been fixed for October 1 and 2.

F. L. Graham, manager of the Eastman Ranch, San Fernando, has recently secured an outstanding son of the noted Poland China boar, Liberator, from Bert Harriman of Missouri. It is probable that the youngster will be seen at the state fair and other fall shows.

E. N. Whittemore, manager of the Berkshire breeding herd maintained by D. J. Bastanchury at his Santa Catalina Rancho, La Habra, recently visited the Berkshire herds of the Sacramento Valley. Whittemore reports having purchased a sow from Zed Williams of South Carolina, carrying the service of Laurel's Champion Best, a full brother to the $5,000 Laurel's Champion Grand Leader. The Santa Catalina herd consists of around 35 head of sows.

Bruce S Bennett, field secretary for the Western Berkshire Congress, is now engaged in selecting consignments for the congress sale to be held at the university farm sometime next month.

California Ayrshires are making good. A splendid record has just been completed by the eight year old cow, Rena Ross 3rd, owned by J. Henry Meyer, Elkhorn Farm, Watsonville, her record being 16,134 pounds milk, 649.30 pounds fat, 4.02 per cent. This constitutes her third record, the three totaling 45,958 pounds milk, 1,884.70 pounds fat, or an average of 15,319 pounds milk, 628.23 pounds fat, 4.10 per cent. Rena Ross 3rd belongs to a noted family of producers developed by Highland Farms, Bryn Mawr, Pennsylvania. She has five daughters, all full sisters. The six cows have 15 Advanced Registry records averaging 13,389 pounds milk, 546.03 pounds fat. The five daughters are all sired by Finlayson Imp., leading A. R. sire of the Ayrshire breed, he having over 100 entries to his credit, averaging approximately 10,500 pounds milk and 450 pounds fat.

J. I. Cazier and Sons, Hereford breeders of Wells, Nevada, have just received a young bull from Robert H. Hazlett of Kansas. The youngster, a son of Bocaldo 6th, grand champion bull at the leading 1916 shows, and out of a Publican dam. Messrs. Cazier also selected four females from the Mousel herd and six from the Jesse Engle herd.

Chas. Rule of Jenner has purchased two young bulls and two females from the Mousel herd in Nebraska.

James Marwick of Santa Barbara, who has been breeding Percherons, has decided to enter the ranks of the Aberdeen-Angus breeders and has purchased a number of high class animals from leading Scottish herds to use as a foundation in building up a top herd.

E. E. Greenough writes: "Sunshine Farm Jerseys are coming fine on test. Our senior yearling heifer, Beauty of Sunshine Farm, will finish with over 400 pounds fat if nothing happens, class AA. Edna of Venadera's Birdie made 65 pounds fat in December. We have just sold our young bull, Duchess Exile King, to Mrs. Sylvia Stornetta of San Luis Obispo. This calf is a line bred St. Lambert-Flying Fox bull and should prove a fine sire. His dam was third prize aged cow, Sacramento, 1919."

WESTERN BERKSHIRE CONGRESS HOLDS SUCCESSFUL SALE

The Western Berkshire Congress held its first promotion sale of the season at Marysville, April 22. Much interest was shown by the farmers of that community, but the outstanding feature was the selling of some animals that had been developed by some of the pig club members of the community.

While the main object in holding these sales is the introduction of Berkshires into new territory, it is also planned to cooperate with pig club members and the younger breeders in creating a market for their breeding stock. That the main object was accomplished is attested by the fact that every animal consigned to the sale by the various breeders remained in the community.

The farm bureaus of Yuba and Sutter Counties gave the sale their hearty cooperation and much of the success of the sale was due to their efforts. The bred sows sold for an average of $90, while the bred gilts sold from $60 to $90. Cols. Leachman & Snook of Sacramento were the auctioneers. Bruce S. Bennett managed the event for the congress.

The De Laval Milker

Solves Milking Problems

One man can milk three times as many cows in an hour with a De Laval Milker outfit as by hand

The De Laval Milker is simple in construction, easy to operate, and dependable in action. It is faster, more reliable and more sanitary than any other method of milking.

The De Laval Milker is always on the job, week-days, Sundays and holidays, and during the present shortage of help, this is an important item in solving the milking problem. The fact that the De Laval way is easier and more pleasant lightens the work. Better satisfied help is the result, and the boys are kept on the farm.

Wherever cows are milked the world over, the name "De Laval" stands for quality and highest value to the user. The fact that it bears the name "De Laval" is a guarantee that it will give the service claimed for it.

Write to nearest De Laval office for Milker Catalog, mentioning number of cows milked

DISPERSAL SALE

28 Registered Holsteins

Because he must go East, and will not entrust the care of his choice herd to strange hands, Mr. L. B. Van Blaricon has instructed us to disperse it at public auction on his farm one mile north of

El Monte, California
Saturday, May 8, 1920

This is one of the choicest herds in Southern California. The owner has milked his own cows for the past six years, and the herd has been tuberculin tested regularly without a reactor for the past three years. The breeding of the herd is most substantial and the sale includes:

A GRANDDAUGHTER OF RAG APPLE KORNDYKE 8TH out of a 21 lb. four year old that made 512.12 lbs. butter in 305 days, second dam the 36 lb. cow Alba Sadie Cornucopia Creetia who made at a previous freshening 866.28 lbs. butter in 338 days.

A 26 POUND 4 YEAR OLD granddaughter of King Segis De Kol Korndyke.

A 25 POUND DAUGHTER of Arcady Cornucopia Johanna Lad.

A DAUGHTER OF JOHANNA McKINLEY SEGIS, 40 lb. son of King Segis.

A 21 POUND 4 YEAR OLD daughter of Woodcroft De Kol Sarcastic Lad.

A DAUGHTER OF A 28 POUND COW, that has three A. R. O. daughters.

SEVERAL 16 TO 19 POUND 2 YEAR OLDS, by good sires and out of highly bred dams.

TEN DAUGHTERS OF KING LYDA PONTIAC, who is by a son of King of the Pontiacs and out of a three-quarter sister to the first 41 pound cow Valdessa Scott 2nd.

If you want to buy clean, high producing, well bred females, in good condition, this sale is well worth a long trip.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL TUBERCULIN TESTED BY A DEPUTY STATE VETERINARIAN.

Milk Goats for Mining Camps

By E. P. Taylor, University of Arizona

"GOATITIS" is a new disease in Arizona. A well defined case always follows a good long draft of cool rich goat's milk and the symptoms are a call for more goat's milk and a desire upon the part of the person affected to immediately get into the milk goat business.

There are about 15 mining camps of considerable size in Arizona, some of them with a population of 25,000 or more men, women and children. Bisbee, Jerome, Clarkdale, Verde, Oatman, Ray, Superior, Hayden, Miami, Globe, Clifton, Morenci, Metcalf, Douglas, Ajo and the smaller camps have a combined population of about 175,000 souls, which is a very large percentage, about 50, of the total population of the state.

The people in these mining and smelter towns are up against it for milk for their babies and their families to drink. While dairy cows have vanished before the wave of cotton in the Salt River Valley to the number of 50,000 during the last year or a little more, the milk supply situation has become even more of a problem in the mining camps where alfalfa hay and all kinds of shipped in feeds come high.

I recently visited the town of Ray, a copper mining camp of about 4,000 stomachs and where the milk question has become a serious problem, and while there met a man with one of the best defined cases of "goatitis" it has been my pleasure to encounter. This man is T. S. Jacobs who is connected with the Ray Consolidated Copper Company and with other enterprises in the district which have given him a chance to see what a serious problem the milk supply for a mining camp has become. After witnessing what Mr. Jacobs is doing in the way of supplying goats' milk to his own family and neighbors to meet the situation I was convinced that his case of "goatitis" was fully warranted.

What Mr. Jacobs is doing thousands of others in mining camps and railroad towns and other towns in Arizona may do. His milk goat experience is worthy of telling for the benefit of others.

Mr. Jacobs lives on a hilside in Boyd addition to Ray. He has a wife and three healthy happy children all of whom like goat milk and who get plenty of it to drink. Mr. Jacobs started last November with "Altdorf Dora," a registered Toggenburg doe bought at a cost of $100 from a breeder in California. Dora likes the copper hillsides of Ray and, since bringing triplet kids several months ago, with the feed and care given her has been making a very fine milk production record. When fresh she gave four quarts per day and she now runs 55 to 62 ounces per milking.

At the time of my visit to "Altdorf," which is the name Mr. Jacobs has given to his goatery, Dora had just completed a milk production record for March of 99.2 quarts of milk for the month, or an average of 3.2 quarts per day. For February she had produced on an average of 3.08 quarts per day.

Tacked to the wall of Dora's milk house was a sheet with the exact records for February as kept by Mr. Jacobs, which showed feed and cost as follows:

Barley	41.25 lbs.	@	4.28c	$1.77
Bran	37.8 lbs.	@	3.84c	1.45
Beet pulp..	5.9 lbs.	@	3.1 c	.18
Corn	1.0 lbs.	@	.....	.08
Alfalfa				1.30
Total				$4.78

Her milk production therefore had been at 5.4 cents per quart for feeds and these at retail prices bought in a local way at mining camp figures. For the month of March cost of feeds amounted to 5.2 cents per quart.

Mr. Jacobs has compared this cost of production for February with the cost for feeds to milk cows at Ray. At wholesale prices feed in Ray to milk cows cost $17.78 per month per animal as compared with $4.78 for feed for a single milk goat.

During the month of March Mr. Jacobs had fed Dora all the baled alfalfa she would eat from her manger, and twice a day, night and morning, at milking time she now gets two cups (11 ounces) rolled barley and two cups (11 ounces) bran.

Mr. Jacobs has equipped his little goatery with three houses, a "kid house," a feed house and a milk house. Dora eats her feed of grain in a stanchion in an electric lighted milk room, standing upon an elevated milking platform while the milker sits at the side upon a projecting seat.

Only a small goat run is provided, such as most any miner's backyard would provide. Mr. Jacobs showed me hundreds of acres of hillsides tributary to the town of Ray, covered with wild grasses, alfilaria and brush which could be easily enclosed and utilized for milk goat pastures handy to the miners houses. Goat milk sells for about 30 to 35 cents per quart in a city like Los Angeles and it is safe to say would bring much more than this in a mining camp where only canned milk, patent milk powder, and milk substitutes abound. A look at the rosy cheeks and healthy bodies of Mr. and Mrs. Jacobs' three children fed upon goat milk convinced me that goat milk for babies was the proper thing.

Goat milk properly handled does not have a bad odor nor does it have a disagreeable flavor. There has been a prejudice against it which is rapidly being overcome. In Europe goats milk is a common article of diet. Physicians give testimony to its value as food for infants as well as for older children. It is in great demand as an invalid food and many adults prefer it to cows milk. It is very rich and usually requires dilution.

Milk as a necessity in the diet of the child is being urged by mothers, physicians, school nurses and home demonstration agents. In Arizona the home demonstration agents have made this subject one of the leading projects for education among the people. The supply of milk has fallen very low. In one railroad town in northern Arizona the home demonstration agent took a survey in a group of 85 children to ascertain the number of children who were receiving milk to drink. She was surprised to find that not one received fresh milk in their diet. An investigation in the homes of these children verified the appalling fact.

Surplus male kids are a rare delicacy as food. Goat and kid skins are of considerable value. The number of goat skins imported into the United States annually in normal times is 40,000,000. The milk goat industry is one which is sure to develop rapidly for as shown milk goats may be kept where milk cows cannot.

HANDLING OF FOAL

It is of the highest importance in horse producing that the young start life in full health and vigor. The foal should as soon as able to stand, take a good draught at the "colostrum" or first milk of the mare. This milk or colostrum has purgative properties which discharge from the alimentary tract the foecal material which collected within during foetus life. If the foal does not naturally pass the foecal matter, then give a gentle purgative of castor oil.

With the alimentary tract cleared the foal can utilize the natural milk which follows. The young foal will naturally at once gain weight, strength and make a good growth. The owner of the mare and foal should know the condition under which the dam must foal.

If the dam is not able to supply the proper amount of nourishment, the foal will not make the proper growth and development. The mare should have a good pasture grass, but if this is not available some concentrates, such as, oats, rolled barley or wheat bran with some corn should be used.

The first few days after foaling, the mare should be in a box stall and a small lot, with simple feed and not too abundant.

In seven to ten days the mare and foal may be turned to pasture; but protect them from the inclemencies of the weather. Keep under favorable conditions, and the mare and foal will shift for themselves, but use watchfulness as to the first appearance of dif-

LISTER MFG. COMPANY
Box 716 Clarinda, Iowa

Tulare Cooperative Poultry Association store is now doing a daily business of $1,000

ferent ailments. Diarrhoea is one of the most common troubles and should be checked at once. The correctives for this are as follows: Boiled milk, parched flour or a gruel. These materials are simple and can be used most successfuily. Constipation, another ailment, may be relieved by the use of castor oil.

At the age of two months the foal should acquire a taste for grain. As soon as the colt begins to eat readily a pen should be built, making it high enough to keep the dam out, and the foal will pass below. Thus, it will soon get the habit of feeding from the regular feed trough. Keep the ration, and especially the oats, well supplied.

By using this system the colt at weaning time will be easy to wean, and then it does not miss its dam. The foals are usually weaned at five or six months. At weaning time increase the ration and the foals will make a good growth and later mature into a good grade of horses.

THE HORSE COLLAR

Friction and pressure are the two important factors to be considered when fitting a collar on the horse. The injuries due to pressure can be largely eliminated if distributed over as large an area as possible. The contact area of the collar of the horse when pulling should be distributed with the same intensity from the withers down to the breast on a line with the shoulder joint, including the anterior edge of the shoulder blade.

This adjustment is not easy at all times on account of the variation, in conformation and size, of the animal. If the collar is of the correct size and the structure of it and the hames are such as to give it the proper rigidity, these variations on the bearing surface of the animal and collar will soon adjust themselves and come into correct apposition. The contour of the bearing surface of horses usually varies considerably and, therefore, the collar when once molded to one horse should not be used on another.

Friction cannot be entirely eliminated on account of the variations of movement of the animal. Correct apposition, however, in adjusting the collar will eliminate much of it.

The bearing surface of the collar should be smooth and cleaned frequently. Dry perspiration on a collar will soon cause sore shoulders.

The collar should not pinch at the crest of the neck and should be loose enough below to permit the free passage of the open hand between the neck and the collar. Pads under the collar should not be used except when a sore area is being protected by a window cut in the pad thus preventing the collar from coming in contact with the irritated portion.

PIN POINTS ON SILOS

By University of Arizona.

The tractor will help farm more acres, but will not grow beef and dairy products.

The tractor does not add fertility to the soil.

The silo dies not change roughage into concentrates, but it does reduce the amount of grain necessary to keep cattle in first class condition.

A pit silo is good insurance; costs little; will not blow down or burn up; is easy to fill.

It is dangerous to feed moldy or frozen silage to pregnant cows.

One acre of corn silage at ten tons will feed two cows a year. More tonnage, more cows per acre.

Care must be taken to feed only first class silage to horses or mules, and then in limited amounts only.

In the corn crop, 30 to 40 per cent of the crop value is lost in the fodder that is not used.

Dry fodder plus water in the silo increases the feeding value 50 per cent.

There are types of silos to fit every need, so build the silo that fills your requirements.

There is no best silo. Any silo rightly made is good. The most expensive silo, poorly constructed, is worse than none.

It is not a good policy to build the silo in a barn, especially a dairy barn, on account of the odor.

Silos with angles are hard to tramp and the air is liable to circulate down the corners and cause the silage to spoil. A round silo is best.

Be Fair to Yourself

Every man or woman in California who owns a herd of registered Holsteins; every man or woman in California who hopes to own a high class herd of registered Holsteins, should, in justice to their own best interests, attend the dispersal of the famous W. J. Higdon herd, for it is one of the rarest opportunities to secure breeding animals of the very first rank. Mr. Higdon retains only the young daughters of King Korndyke Pontiac 20th as the basis for a future herd, the sale offering consisting of

55 Registered Cows, Heifers and Bulls
Sale Pavilion, Tulare, Cal.
Wednesday, May 5, 1920

King Korndyke Pontiac 20th

SIX 30 TO 36 POUND COWS constitute the largest group of thirty pound cows ever offered by a California breeder at one time, and as individuals and as to pedigree they are equal to their great records.

COWS AND HEIFERS WITH 1,000 LB., 800 LB., 700 LB. YEARLY BUTTER RECORDS are in the offering, splendid individuals.

TWENTY DAUGHTERS OF PRINCE RIVERSIDE WALKER will be sold, and they are one of the very best groups of daughters of one bull ever offered in any sale ring. Remember that they are all granddaughters of Aaggie Acme of Riverside, 1,054 lbs. butter in one year at 12 years of age, she the dam of Aaggie Acme of Riverside 2nd, 1,331.78 lbs. butter in one year, the world's official record, she in turn the dam of Miss Aaggie Acme Burke, 1,034.44 lbs. butter in one year as a first calf junior 2 year old, and her record of 24,338.8 lbs. milk in one year the world's record in class. Think what wonderful foundation breeding animals these heifers are.

You know all about KING KORNDYKE PONTIAC 20TH, who is bound to make a fortune for the lucky breeder who takes him out of this sale ring.

AND DON'T OVERLOOK the real herd headers among the younger bulls, including three sons of King Korndyke Pontiac 20th out of 30 lb. dams; a son of Prince Riverside Walker out of a 32 lb. 3 year old with over 750 lbs. butter and over 20,000 lbs. milk as a junior two year old; a son of King Korndyke out of a great yearly record daughter of King of the Pontiacs; two younger bulls of rich breeding.

Every Animal Positively Guaranteed to Be a Breeder; Every Animal Tuberculin Tested and Sold Subject to Retest by the Buyer.

REMEMBER—That this herd has been regularly tuberculin tested since its foundation; that there has never been a case of contagious abortion in the herd; that the herd is composed of young cattle that are on the upgrade, the sort that can not fail to make money for their new owners.

SONOMA FARM BUREAU ACTIVE FOR BETTER LIVESTOCK

A meeting of the executive committee of the dairy department of the Sonoma County farm bureau was held at Valley Ford on April 22 to outline a plan of work for the coming year. The question of marketing hogs was brought up and various plans considered, such as holding auction sales at regular intervals and pooling hogs in carload lots and sending to San Francisco with a local manager. In the San Joaquin Valley the counties of Stanislaus, Tulare, Fresno, Kings and Kern have organized a hog auction system whereby there is a sale held in one of these counties each day of the week. This system has been extremely successful in that better prices are obtained by the producer and the farmers have seen the value of producing good hogs and the kind that the packing houses want. The system of pooling hogs and selling them through a local manager has been tried in Napa County with similar success.

It was suggested that it might be a very good plan to cooperate with Mendocino, Marin and Napa Counties so that a series of sales could be held regularly. Under such a condition a permanent manager could be employed to arrange and supervise these sales and grade the hogs, and buyers from a distance would be attracted to compete for these hogs.

A committee of the following men was appointed to look into the feasibility of establishing either hog auction sales or a pooling system: W. B. Hopkins, J. R. Gallagher and E. Steinbeck.

The plans for holding a sale of pure bred dairy bulls were put in the hands of A. Purvine, C. A. Le Baron and S. A. Gambonini. The dairymen of this county have already obtained some pure bred stock and desire to increase this number. By having a sale in September there will be an opportunity to purchase pure bred sires, as well as to see what good stock looks like. The fact that the sale will be held within reach of the dairymen should increase the interest taken and guarantee its success.

At present there are about 3,700 cows under regular monthly test in this county. The benefits of cow testing are growing more apparent to the dairymen and there are many whose cows are not now being tested who desire to put their herds under test in the future. There will therefore be a reorganization of the cow testing work so that more territory can be covered with less duplication. Next year there should be more than double the present number of cows under test.

It is desired to have an exhibit at the county fair this August showing the benefits derived from cow testing. This will be handled by the cow testing committee, composed of J. R. Gallagher, W. B. Hopkins and E. Steinbeck.

Mr. Rathbone of the Petaluma high school is arranging the preliminary organization of a calf club. This plan has been tried in other schools and has proven successful financially to the members as well as in educating them regarding the use of pure bred stock.

A plea for real hog pasture, not simply hog yards, is made by Forest Henry of Dover, Minnesota, a well known institute leader for the agricultural extension division of the Minnesota college of agriculture. Mr. Henry believes in giving the hog a goodly modicum at least of the treatment and attention accorded other farm animals. He says:

"The most profitable hog pasture is a pasture so large that the hogs do not eat one-half of it. If it be alfalfa or clover, what remains uneaten at haying time can be cut and cured into hay. An acre of alfalfa or clover will make as much pork, so far as it can be used, as an acre of corn. The one builds up the farm and requires very little labor; the other reduces farm fertility and requires much high priced labor.

"Good pastures not only make cheap pork, but keep the hogs in much better health and reduce the danger of hog cholera to the minimum. In these days a hog cannot be grown on grain alone and at the same time make money for his owner."

Harrison's Opportunity Sale of Milking Shorthorns at Santa Rosa, Cal., Wednesday May 5, 1920

52 Head, 43 cows and Heifers

Including most of the Harrison show herd of recent years. Cows and heifers of Blue Ribbon Caliber, some of which are as yet undefeated in the show ring. Many Record of Merit cows and others on official test.

9 Bulls an offering of real merit

Including Foothills Corporal, Grand Champion at Portland in 1919 and one of the best Dual Type bulls in the United States. Also young bulls of Royal Heritage and worthy of consideration as herd heading propositions.

Foothills Corporal 510415

When such individuals as Foothills Corporal, a Grand Champion and one of the best dual type bulls ever offered at auction, Colonel Oxford 1st, a young bull very rich in Clay breeding, Welfares Belle, winner of five blue ribbons last year and as yet undefeated in the show ring. Naomi 2nd, whose February record stands third in the United States, Bethsinda, one of the most richly bred cows of the breed and many others now on test and with enviable records are offered for sale, it is time for the admirer of Dual Purpose Shorthorns to act. It is with great reluctance that Mr. Harrison has consented to part with some of these cattle that would be priceless at any other time. Now is the opportunity to improve your herd at your own figure and obtain the benefit of Mr. Harrison's years of constructive breeding.—J. P. Bennett, representing the California Cultivator.

Caledonia Farms' First Sale of Shorthorns

At The Farms, West Sacramento

Thursday, May 27

70 Scotch and Scotch Topped Cows

Imp. Caledonia

The forthcoming sale of Caledonia Shorthorns should be regarded as one of the important events in the development of the breed in this state. The writer has been familiar with every Shorthorn sale held in California during the last four years, and he does not hesitate to say that, taken as a whole, the offering from Caledonia Farms constitutes one of the most uniform and desirable lots yet to be offered.

It is not only the largest offering of females ever made in the West, but it makes available for the first time cows bred to or with calves at foot by the outstanding bulls, Imp. Caledonia, Gainford Matchless and Pine Grove King. It is quite within the facts to say that no Western herd possesses three bulls of as great merit.

It has long been Mr. Cebrian's intention to make Caledonia herds a source from which foundation material could be supplied and the present offering has been selected with a view of supplying the needs of the established breeder and particularly the beginner. There will be included a goodly number of Scotch females, but the major part of the offering will consist of carefully selected Scotch topped females. The offering will be presented in splendid breeding condition. Every animal is guaranteed to be a breeder and all have been tuberculin tested.

There is in this state no more alluring opportunity than the production of registered Shorthorns and the coming sale affords an opportunity to select superior females from one of the choicest collections of the breed owned in America.

(Signed), R. P. ROYCE, Livestock Editor, California Cultivator.

Caledonia Farms offers about 40 exceptionally good young bulls suitable for range service, at private sale. They can be seen and purchased on sale day. Write for the special bull sale list.

Good Milk Fails to Make Good Butter

By E. H. Hageman

QUESTIONS like the following come constantly to the Cultivator. Therefore these are quite fully answered in the hope that many readers may benefit.

What is, or may be, the reason for good milk failing to make good butter, or sometimes, to make any butter at all? The cow is well fed, mature but not aged, the milk plentiful, sweet and rich, the handling cleanly and careful. The cream, fine in color, taste and quantity, acquires a slightly bitter taste after 36 hours; the butter is impossible to get in cold weather, and when obtained is not sweet enough to be choice and is too dry in texture. Bean straw is not the trouble.—Subscriber, Carpinteria.

I have a good Jersey cow, fresh for the first time. Gives about one gallon of milk at a milking. We feed her good alfalfa hay, wild oat hay and good barley hay and have been giving her a good armful of green mallard weed every noon. She came in fresh three weeks before she was due. Her milk is nice and sweet, also the cream, but when the butter is about 36 hours old it commences to get strong. My wife works the butter thoroughly. Please advise what to do to keep the butter sweet longer than it does.—Subscriber, Porterville.

Subscribers having trouble as above may be assured that unless the cows find or are given strong flavored food, such as spoiled silage, onions, cabbage, rag weed, or any other strong flavored material, it is not the cow that is guilty, but invariably the person handling the milk from time of milking until the finished product is reached, because the good "bossie" protects the milk in her udder just a little better from contamination than does the average dairyman after the milk is drawn. The process of making butter really commences at the time of milking,

In a one or two cow dairy the tendency is natural on account of the small supply produced at each milking to hold the milk in the pans or other vessels too long before skimming the cream. Then the cream is usually held too long before churning, which results in undesirable bacteria or ferments gaining control of the flavor.

In small dairies a dairy thermometer is usually lacking when we know that it is a fact that proper temperatures are a leading factor in dairy manufacture. A churning temperature for winter or cold weather will not do for summer or warm weather, or vice versa. It is for above reason that often in cold weather when cream is churned at weather or natural temperatures, butter will not come at all. Temperatures must be controlled by artificial heat or cold in dairy work if success is expected. On account of weather changes, lactation period of the cows, feed conditions, etc., a change of cream raising and churning temperature is required also, and therefore the necessity of good thermometer.

No one can give you word for word instructions to make good butter. You must experiment and think out a lot for yourself. A little expense and effort should not be spared, because you can feel just as proud and pleased to make good butter from the cream of one or two cows, as from a larger herd, bec use it is more difficult to make uniformly good butter from a few cows than from many cows.

Cream and milk should not be kept in the house near the stove in cold weather, where it may acquire the flavor of each member of the family or placed near vegetables or other food products. Provide a nice clean dairy room, protected from the cold weather and hot weather in summer for which a concrete built room answers best.

Pasteurizing cream for butter making is not being practiced in small farm dairies, but it is worth while to give it some thought. Practically all butter made in creameries is made from pasteurized cream. The greatest obstacle on the farm would be to cool the cream from pasteurizing temperature which is 145 degrees Fahrenheit to churning temperature of about 50, which would require some source of artificial cooling. The process would be as follows:

Heat the cream on the stove in a double boiler to 145 as quickly as possible, stirring cream while heating. When 145 is reached hold at that temperature for 20 minutes, then cool as quickly as possible to 50 in ice water. Hold at 50 for three hours and churn as usual. Pasteurizing as above will rid cream of foreign flavors, dirt and disease germs and will make a uniform, good keeping quality butter.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.
Unsigned communications receive no attention.

Hog Paralyzed

I bought a young hog about six weeks ago and the morning after bringing it home noticed it was stiff and sore all over. In a few days it went down behind and is not able to stand very long at a time. Its hind legs give way and it falls down while eating. The hind legs are full of hard lumps. I thought it was kidney trouble and gave medicine for that, but it did no good. It does best on milk diet and seems worse when feeding stock feed. What would you advise doing?—Subscriber, El Cajon.

Probably he got warmed up too much bringing him home and caught cold, giving him rheumatism. That also will affect the kidneys. Keep him in the sunshine as much as possible but protect him from the cold at night. Give him a warm, dry place to sleep. Feed sour milk if you can get it. Get four ounces of tincture of juniper berries and two drams of salicylate of soda. Mix them and give a teaspoon of the mixture in the feed twice a day.

Cow Pox

I am having some trouble with my cows. The skin above and on the udder is swollen and breaks out with small sores that have bloody matter in them. I called a veterinarian to see the first one that had it and he said it was cow pox. Is there any solution that I can dip the cows in that would stop it?—Subscriber, Dunham.

Bathe the parts once a day with a solution of permanganate of potash, using a dram to a quart of water. Wash the hands after milking each cow to prevent spreading the trouble. Also mix five pounds of epsom salts and three pounds of common salt and give a handful in the feed once a day.

Cow Ailing

I have a cow that came fresh January 14, having gone two weeks over time, and bore a heifer calf. The afterbirth did not follow in time and I had to have it removed. She is in good condition and gave eight gallons of milk for a while, but dropped back to seven, which she kept up until recently. She has now dropped to three gallons and is having some trouble with the two back teats. They do not milk out clear and feel lumpy and thick. She was tested for tuberculosis just before calving by the state and pronounced all right. She has plenty of grass and I am feeding a five gallon pail of mill run and beet pulp twice a day. Do you think I am feeding too heavily? I have three other cows that are doing all right, but am anxious to know what is wrong that I may save her and prevent trouble with the others.—Subscriber, Berkeley.

You are feeding the cow too heart-

DR. HESS DIP and DISINFECTANT

A Dip that is standardized, of uniform strength and **GUARANTEED.** One gallon makes 70 gallons of dipping solution.

For Scab, Ticks and Skin Troubles

Dr. Hess Dip and Disinfectant cleans and makes the skin healthy. It is more than a Dip—it is also a Disinfectant. The American Polled Hereford Association is planning an auction sale of bulls and cows to be held at Fresno, May 7.

ily. Her system is clogged, her blood too rich, and indigestion probably accompanies the rest. First physic her out by giving the following: One ounce of aloin, two drams of powdered nux vomica, three ounces of turpentine and one quart of raw linseed oil. Mix all together and divide into two doses. Give the medicine as a drench and give the second dose 24 hours after the first. Mix three pounds of epsom salts with two pounds of common salt and give a handful of this in the feed every morning. Also get four ounces of powdered gentian, four ounces of bicarbonate of soda, two ounces of powdered nux vomica and six ounces of corn meal. Mix all together and divide into 16 powders. Give one powder in the feed every night. You had better show this to your druggist and let him prepare it all for you and write directions. Reduce the feed you have been giving one-half and be sure to feed alfalfa hay or some kind of roughage that will form a cud. If you can get some green alfalfa or volunteer oats it will be good, but get the ripest you can find, so it will form a cud. Rub the udder and milk out all you can but do not try to inject anything into the udder.

Cow Swelling Under Throat

I have a cow that swells some under the throat and the swelling extends down the dewlap. Have bathed it with sheep dip and fed her sulphur but she does not improve. Our dog had mange and was with the cow a great deal. I thought that might have caused it, but she does not rub as I suppose she would with mange. Will look for a remedy in the Cultivator.—Subscriber, Live Oak.

Probably it is not mange and will leave soon. However, you had better wash it off clean and when dry rub in some engine oil, the same as is used in automobiles. That will cure the mange and will do no harm whatever is wrong. Feed laxative feed and give a handful of epsom salts in the feed for a few days.

U. S. BRED STALLIONS FOR FARMERS

The United States department of agriculture has bred and developed several stallions in its horse breeding project now located at the United States Wyoming horse breeding station, Buffalo, Wyoming. The stallions will be leased to private breeders and community breeding clubs for the coming breeding season. In this way it is proposed to assist in the improvement of the light horse stock of the range country where stallions of merit are not availabe and in those sections where light horses are preferred.

The number of available stallions is limited to about ten, as only the best of those produced have been retained or will be allowed to go out for public service. These stallions range in height from 15 hands 1 inch to 16 hands 2 inches, weigh from 1,500 to 1,400 pounds, and in nearly all cases are tried sires and known producers.

The object of the work at the station in which these horses are being produced is the preservation and development of a utility horse suitable for range and farm conditions. The points especially emphasized are the development of size, soundness, tractability, action, and stamina, in a useful animal which can be used under the saddle, on the road, or in the field.

Persons interested should address correspondence to the Wyoming Horse Breeding Station, Buffalo, Wyoming.

There was large enrollment of farmers at the short tractor course conducted at Fresno under the auspices of the state board of education and the farm engineering department of the college of agriculture.

Chico, Butte County, held wild flower show and festival last week.

COMPLETE DISPERSAL SALE

OF THE

Fred Hartsook Herd

OF

REGISTERED POLAND CHINA HOGS

"The Home of Champions"

At the Hartsook Ranch, between 3rd and 4th Sts., on the Lankershim Blvd., at

Lankershim
Thursday, May 6th
at 10 A.M.

The owner has instructed us to close out without reserve one of the grandest lots of registered Poland China Hogs that have ever been offered at public sale in California.

To those who have attended the California State Fairs, Riverside, Fresno, Modesto and Los Angeles fairs this herd needs no introduction as it took a very large percentage of all the ribbons.

Included in this sale is a sow that was the Grand Champion Jr. Yearling at the California State Fair in 1918. A sow that was included in the Grand Championship Herd at Sacramento, Fresno, Riverside and Los Angeles. Three sows and a boar sired by Model Major, 1916 Grand Champion, Aged Class, State Fair, and the Boar that won the Sweepstakes over all breeds at Modesto. Three sows and a boar from Big Beauty, Grand Champion at Sacramento in 1918 and one of the Grand Champion Show herd. The balance are sired by either Model Major or I B A Wonder, the Reserve Grand Champion at the Panama Pacific Fair and one of the Grand Champion herd at the Liberty and Riverside Fairs. Six young boars out of Beauty's Pride and sired by Long Smooth Jumbo, a boar that stands 46 inches high. A special attraction. An 18-month-old boar sired by Model Major and out of Big Beauty. Never before in California have buyers had an opportunity such as this to select the very cream of the Poland China breed.

The Registered Holsteins

Include seven young bulls, a number of which are ready for service, sired by Hazelwood Finderne Fayne, whose sire, Finderne Pietertje Fayne, is siring some remarkable high producing daughters and is by King Hengerveld Aaggie Fayne, the sire of Finderne Holigen Fayne, who produced as a 3-year-old 37.34 lbs. of butter in 7 days. The dam of Hazelwood Finderne Fayne is Bonnie Lass Pauline, butter 7 days 33.79 lbs. and 30 days 133.58 lbs. She was the Grand Champion cow at the National Dairy Show in 1912. The dams of these bulls to be sold are ARO cows with records as high as 24 lbs. of butter in 7 days. Never before have Southern California dairymen had such an opportunity to buy royally bred herd sires at their own price. FRED HARTSOOK, Owner.

Rhoades & Rhoades, Auctioneers

BERMA RANCH

Size and quality predominate in our big type Poland Chinas. No better big type sows are found in the state. Buy Berma Poland Chinas and you buy wisely.

WANTED

I WANT A MAN

A REGULAR MAN!

I am tired trying to get along with inefficient labor. What I want now is a man ambitious, straight-shooting, who knows how to farm, who is honest and not afraid to work or use his head. If I can find such a man, married, of course, who is really capable and familiar with Island farming, I can make him an attractive offer. If you can't fill the bill don't bother to write—but if you can, write Box 913, Sacramento.

Herdsman or Foreman (married) with college training and lifetime experience handling purebred dairy cattle. Will consider change of position, lease or partnership. Familiar with all the fine points of breeding and general dairy farm management. Box 3, California Cultivator.

Wanted—To hear from owner of good ranch for sale. State cash price, full description. D. F. Bush, Minneapolis, Minnesota.

If You Want to sell or exchange your property write me. John J. Black, 116th St., Chippewa Falls, Wisconsin.

Wanted—Position on ranch near Los Angeles by man familiar with all kinds ranch work. Address Box 1, Cultivator.

FERTILIZERS

The Gypsum You Need — Best agricultural lime, complete fertilizers. H. E. Matthews, 1010 N. Madison, Pasadena.

FARM LANDS FOR SALE

SPANISH
PEANUTS

After SEVERAL YEARS of successful experimenting on our loose sandy soil, filled with lime, we are embarking, on a large scale, upon the raising of Spanish peanuts.

IRRIGATED LAND
FOR RENT WITH
OPTION TO BUY.

Responsible and experienced farmers can get share leases on tracts of 40 acres and upward of land, all plowed, ready for planting; good water rights, in concrete mains, low rates.

Land is in Southern California, fifty miles east of Los Angeles, bordering on or close to paved highway.

One man with team can readily care for forty acres. Good farming produces crops of from 1000 to 2000 pounds, which should sell, at harvest, from 10 cents a pound upward. The hay can be sold in advance, on contract, at three-fourths the price of prime alfalfa. Produces a ton to the acre.

The peanut is a legume and enriches the soil in which it grows. Investigate this, you will see that a good farmer, with a team, should clear several thousand dollars in a season.

OPTION TO BUY.

Lessees are given, without charge, option to buy and any time within six months, at low prices and on very easy terms. Splendid fruit-growing soil and climate. Peanuts are splendid for intercropping. Rent terms, one-fourth crop; company pays one-fourth water. Provides threshing facilities.

INVESTIGATE.

You will be amazed at the development of demand for peanut oil and products, which has shot up the demand and price. This is the opportunity you have been looking for, to rent land, try it out and have option to buy. But it is time to GET BUSY. We have forty tracts of forty acres each, only, and they will go fast.

FONTANA LAND COMPANY,
Fontana, California, or
1237 Citizens' Bank Bldg., Los Angeles.

For Sale—Two acres in North Moneta, 7 room Colonial bungalow with tile bath, toilet, and strictly up to date with built-in china closet and buffet and beautiful open fireplace. Plate glass windows in front, hardwood floors throughout. This is a beautiful home, and must absolutely be seen to be appreciated. This house was built by day labor and very best of material used. There is a family orchard of 125 fruit trees, all varieties, up to date garage, cement walks throughout the place, lawn, flowers. The place is equipped with two large up to date chicken houses twelve by sixty feet each. The price will be made right to the party who appreciates an ideal up to date place. Address Owner, E. G. Gildmacher, R. D. 2, Box 541, Inglewood.

Stock and Dairy Ranch—600 acres, 200 grain, 300 pasture, 100 hay land, 50 A. good potato land. Could be irrigated; 10 miles from railroad on highway in Calavaras County; 75 head cattle, 10 horses, 100 hogs, 2 houses, 3 barns, harnesses, wagons and all farm implements; plenty of spring water all year. This place joins town. Anyone wanting a stock and dairy farm would be pleased with this, the best buy in the state, $30,000: terms to suit. For further particulars apply to T. S. Nemie, 1448 East Washington Street, Stockton, California.

Oranges and Grapefruit
15 Acre Farm $2500
Bearing grove 100 orange, 50 grapefruit, 25 peach trees, also pears, plums, guavas; 7 acres fine truck land, some wood, near RR station, all conveniences, pretty bungalow, fireplace, 2 porches, good water; aged owner makes price only $2500, easy terms. Details page 58 Strout's Spring Catalog Bargains 33 States, copy free. STROUT AGENCY, 831 E J, 405 So. Hill St., Los Angeles, California.

12.80 Acres—5 acres bud soft shell 13 yr. old; 3 acres common soft shell; 79 full bearing Navels; 79 full bearing Valencias; about 3 acres 2 and 3 yr. old Valencias. No buildings on place. 10 shares Santa Ana Valley Irrigation Water stock. Price $42,000. Income $5,000 per year and increasing; 3 crop payment per year. $20,000 down, balance 60 per cent. Write Sadie A. Skiles, 2701 N. Main, Santa Ana.

FOR SALE AND EXCHANGE
10-20-40-60 and 80 acre ranches, rich, level, plenty water; proven grape (Thompson seedless), fig and alfalfa land. Price right, easy terms.

FOR SALE
Some of the finest dairies in the state. Chas. McNeely, Alpaugh, California.

For Sale—Five and 35-100 acres exclusive of roads three miles N. E. of Redondo Beach, California. Being the North six of lot 7 McDonald tract, San Pedro Rancho. Address Jas. T. McPherson, Box 685, Willows, California.

Napier Grass—Strong roots, 25 one dollar; hundred $2.50; thousand $20.00. W. Rubell, 221 N. Catalina Ave., Redondo Beach.

For Sale—About 140 lbs. desert raised alfalfa seed. H. P. Ware, Goffs, San Bernardino Co., California.

Stock Beet Seed—Any variety. Write for prices. Aurora Seed Mill, grower, Stockton, California.

GOVERNMENT LAND

Millions Acres Free Land in U. S.—Full description and all the information as to how to find them contained in "The Homeseeker," a 100-page book. Send for particulars, or $2 for book direct, The Homeseeker, Dept. M, Los Angeles, California.

SALESMEN WANTED

Men With Spare Time—Ranchers especially, can find excellent renumerative proposition, salary guarantee, working for an old reliable California company. Turn your spare time into cash. Write J. H. Yetter, 115 North Broadway, Los Angeles.

THIS MONTH IN THE VEGETABLE GARDEN, NORTHERN CALIFORNIA

By A. R. Gould

NOW that the rainy season is practically over it will be necessary to conserve the moisture as much as possible and frequent cultivation will be the best method to employ. It has been proved that surface cultivation through established crops will not only keep the moisture in the soil, but increase the yield of the crop and make some difference in soil temperature. The wheel cultivator may be used advantageously and will save time where plots of one-quarter of an acre or even less are under cultivation. Where irrigation becomes necessary small furrows or trenches should be drawn between the lines of the crops, and if a good supply of water is given once every two weeks or so and the cultivator used the next day between the rows sufficient moisture will be retained for the crops. Any plots cleared from winter crops should be well trenched with manure before other crops are planted. It rarely pays to be too economical over the manure bill. Furthermore it is useless to expect good crops from poor soil.

Beans.

Sowings of the following may be made from now on: Canadian Wonder, Golden Wax, Stringless Green Pod, all good dwarf varieties, and the following pole beans: Early Golden Cluster, pods six to eight inches long, and Kentucky Wonder, a popular variety, very tender. The Scarlet Runner is a useful as well as ornamental climber and may be planted at once. Davis White Wax and Tepary are excellent varieties grown for shell beans. Sow in rows two to three inches apart and space the rows two feet apart.

Corn

Continue to sow Golden Bantam, Golden Cream, Country Gentleman and Crosby's Early. Sow in rows two feet apart and have the soil well prepared previously.

Celery and Leeks.

Plants of these may be set in trenches prepared last month and they should be planted at least nine inches apart to allow for proper development. Water immediately after planting out.

Peas.

Where the aphis or green fly are still busy with these, spray with Black leaf 40. Continue to sow Little Marvel and Stratagem for succession and these will require frequent irrigation to keep them in active growth.

Lettuce.

Sow Los Angeles, White Pari Cos or May King and transplant later to six inches apart in the rows. This crop repays for extra care, frequent cultivation and watering.

Cucumbers, Melons, Squash.

These may be planted in the prepared plots this month. We advise the following varieties: Arlington White Spine cucumber, very early; Long Green, for general purposes. English Telegraph is usually grown in frames for early use and is long and very tender. Lemon is a most popular variety also, being lemon shaped and yellow in color.

The best melons are Honeydew, Persian and Rocky Ford, all muskmelons or cantaloupes. Casabas, usually grown for their winter keeping qualities, are Winter Pineapple and Santa Claus. For watermelons plant Chilian, Kleckley, Sweet and Klondyke.

Squash and vegetable marrows are worthy a place in every home garden. Sow seeds of the following summer varieties: Early White Bush Scallop. Mammoth White Bush, English Vegetable Marrow; winter varieties for keeping. Delicious Hubbard or Perfect Gem. For pumpkin pies, Mammoth King and Small Sugar. For stock feed grow Connecticut Field, which will produce over 20 tons to the acre. Work plenty of manure into the hills before planting and water the seedlings until they get well established.

Tomatoes.

There is still time to secure strong, healthy plants of varieties, Stone, San Jose Canner, Ponderosa and Earliana. Protect these from the strong sun with paper covers or cheesecloth for a few days after planting. Do not use the same plot for these as used the previous year, and it is not advisable to use the old potato plot.

Potatoes.

The early varieties as recommended last month may still be planted, but secure good seed and plant on clean ground.

The FARMER says=

"for stumping genuine GIANT has no equal"

From recent letters of ten farmers who have used Giant Powders for Stumping we make these extracts:

"1. Your Giant Farm Powders shoot the roots. 2. They have wide breaking power and less bad gases than others. 3. I get the same excellent results from them every time. 4. They are always uniform. 5. I used eleven tons and wouldn't have any other make. 6. I want to sell a lot of other powder that I have because Giant does the work much better. 7. Genuine Giant can't be equalled. 8. I don't have to use so much powder when I blast with Giant. 9. You know what we need for stumping. 10. I save money by using Giant Powders."

Write today for our free book, "Better Farming With Giant Farm Powders." It tells how to save money and get better results in stumping, ditching, tree-planting, etc.

Keep Close to Nature, a Veteran Turkey Breeder's Advice for Raising Poults

By Jean A. Koethen

"KEEP them dry. Keep them clean. Keep them hungry." This is the formula W. D. Robinson of the Robinson Turkey Ranch at San Dimas gives for raising nearly every poult hatched. Mr. Robinson has been breeding turkeys a good many years and has forgotten more about turkeys than most of us will ever know. In fact, he understands them so well that he can almost raise turkeys with his eyes shut. "Don't let them out in the wet." "See that there are no lice on them or on the mother." "Move the coop often." "Above all, whatever you do or don't do, never overfeed," All this sounds familiar. It has been drilled into us from the day we set our first turkey egg. Yet, coming from a man whose yards are filled with beautiful big Mammoth Bronze turkeys, it has added emphasis.

"How do you know," I asked Mr. Robinson, "that you are not overfeeding?" and he answered in almost the very words of the Rhode Island station bulletin, "When they don't come running the minute they they see you, there is something wrong."

No Grain for Poults

The natural feed for little turkeys is greens and animal matter. Grain, Mr. Robinson believes, should not be fed till the birds are nearly grown. Hard boiled egg is the best substitute for the bugs and flies and grasshoppers a little turkey picks up on range, and so, till they are large enough to go out and hunt their meat, egg takes its place.

The poults are not fed at all the first two days after they are hatched, but are kept confined in the coop. As they are always raised by turkey mothers they are not urged to eat but are quietly hovered till they begin to look for food.

The first feed, and the only feed the Robinson turkeys get for ten days or longer is a mixture of boiled egg, lettuce and onion tops and rolled breakfast oats, with a little sand added. One egg for ten turkeys, with an equal amount of rolled oats and twice as much onion and lettuce, all chopped together, makes a satisfactory mixture. Half a teaspoon of this for each poult is thrown on the ground for the first meal, the morning of the third day, and this meal is repeated at noon and again at night. The hen is fed by herself and is not allowed to eat with the poults.

Eighty-seven Years Young

Mrs. Robinson looking over her Los Angeles County Turkey Ranch. They are the Mammoth Bronze and true to name both in coloring and size.

This ration of egg and greens and rolled oats is continued for a week or more and then the egg is gradually discontinued till by the tenth day the birds are getting only rolled oats and green. By this time they are able to pick up quite a little on range and are allowed to run except when the weather is wet or chilly, the hen being kept in the coop. Lettuce and onion are the only greens Mr. Robinson feeds, and the onion is never omitted.

When they are a month old the poults are still on rolled oats and greens, but by this time they are able to range some distance from the coop and pick nearly all their living. The noon meal is now dropped and the poults get only a little at night, Mr Robinson's only rule for feeding is to watch the turkeys and keep them ravenous.

POULTRYMAN'S CALENDAR—MAY, THE TURKEY MONTH

Hatch turkeys with chicken hens, turkey hens or incubators, but brood them, if it is at all possible, with turkey hens. A turkey hen can hatch and rear 18 or 20 poults at one time, and she does not overfeed them as a chicken hen does. A chicken hen can cover from eight to ten turkey eggs.

Probably nine-tenths of all the little turkeys that drop off before they are three months old die from overfeeding. Feed very little at one time and never more than four times a day. Feed green with every meal, especially onion tops. Avoid corn. The most successful feeders give no grain except rolled oats till the poults are three months old.

Keep them hungry. Keep them clean. Keep them dry.

All little turkeys should have green range. Adult birds may thrive in confinement for a while but poults must run and pick most of their living.

Sour milk and cottage cheese are generally believed to be particularly wholesome for poults.

enously hungry. If they come in at night with full crops they get very little, if anything. They have the run of the ten acre citrus orchard, but the mother is always confined. "If you have a patch of alfalfa for them," said Mr. Robinson, "they need no other food."

Mash After Three Months

When the turkeys are three months old and have "shot the red" a commercial egg mash is placed before them and they have access to this at all times from now on. The grain they get they have to thresh for themselves. A bale of barley or wheat is placed in the pen and they help themselves. A little rolled barley and milo is also given but no corn is fed till fattening time.

The breeders are fed in the same way, with mash always accessible and rolled barley or milo at night.

Water is an important part of the turkey's ration and should be always fresh and clean. Three times a day in summer is not too often to replenish the water vessels.

To insure fertility Mr. Robinson mates a tom to from eight to 12 hens, but changes toms every day. The turkey hen, he has discovered, is quite temperamental and will often refuse to mate with one tom but encourage another. His breeders are from one to two years old. Older birds than this are not good breeders and if younger birds are used the progeny are apt to be weak or the eggs infertile.

Poultry Queries

Conducted by J. A. Koethen

Use Mature Toms

I got into hot water, it sems, when I quoted a government bulletin as recommending the use of young turkey toms for breeding. I. H. Severance of Cowell, who has raised turkeys by the thousand, he says, writes: "I know, spite of al the bulletins this side of Washington, that a turkey tom is not fit for a breeder before he is two years old, and three years is better. You never heard of a 15-year-old boy being the father of a Jim Jeffries, and you never will. Nature don't work that way."

I had misgivings when I quoted that bulletin, and yet some expert breeders advocate the use of yearling toms. W. D. Robinson of San Dimas, whom I visited recently, says it doesn't make much difference, if only the toms are well grown. It stands to reason, however, that any bird used for breeding should be fairly mature if the offspring are to be large and vigorous.

Good Book on Poultry Raising

Please tell me where I can get a good book on success in poultry raising.—Subscriber, El Cajon.

Have you tried the Cultivator book, "Poultry for Profit"? It does not pretend to say all there is to be said about successful poultry raising, but it makes a fair start. When you have digested that, try Professor Dryden's new book, "Poultry Breeding and Management," published by Orange Judd Co., New York, and then Harry R. Lewis' "Productive Poultry Husbandry," published by J. B. Lippincott Co., Philadelphia. I do not know the price of the two last named, but the Cultivator book is $1. There are a number of good bulletins on the feeding of hens and raising of chicks published free by our own agricultural experiment station at Berkeley.

Squab Raising

Please give me the name of a book or paper on squab raising. I should also like the names of breeders of Carneaux and White King pigeons.—S. D. M., Ceres.

The names have been mailed you. The best book I have seen on squab raising is the National Standard Squab Book, published by George H. Dean Co., Boston. It gives full directions for feeding, housing, etc.

Blackeye Beans for Poultry

Roy R. Mathews of Buena Park writes: "We have fed Blackeye beans, field run and as screenings from the cleaners without being reground, and prefer them for grain ration to any other grain. Our first test of value came in June when our hens (about 500) had begun to decline in production on a mash, milo maize and cut alfalfa diet. We substituted Blackeyes for milo and after a day or two the flock began eating readily. Within a week or two egg production increased materially, ten to 15 per cent, till we used up our supply, when we discontinued as before with milo and the hens began to decline as is usual during summer months. A short time later we found a couple of sacks of cull Blackeyes we had overlooked and again substituted, with a marked egg increase. The following season we got similar results. We feed them through a self feeder or in straw litter, giving all the hens will eat. If I could get them at the same price as

Milkoline **will help make your hens lay more eggs.**

Feeding Milkoline will make you more money —reduce mortality of your flock— keep flock healthy and less liable to disease.

Increase Poultry Profits Any poultry raiser can easily double his profits by doubling his egg production. Feeding **Milkoline** with other feed greatly assists assimilation, keeps digestive organs vigorous and is a wonderful appetizer, tonic and bowel regulator. **Milkoline** contains nutritive elements vital to egg production and not found in grain rations.

13,000 More Eggs

Jas. E. Keyes, Petaluma, Calif., says: "After feeding **Milkoline** for eighteen months to 2,500 hens, I find that worms cannot exist in poultry where **Milkoline** is used. I reduced mortality with laying hens 10 per cent. I increased the egg production of my flock **thirteen thousand eggs** in one year. Feeding **Milkoline** to laying hens keeps them in splendid health thereby preventing disease and derangements of all kinds."

Milkoline

has a base of modified buttermilk with essential fats and acids added. **Milkoline** comes in condensed form. Will not mould, rot or sour. Keeps indefinitely in any climate. **Milkoline** is simply **"Good Buttermilk Made Better for Feeding."** Flies don't bother it.

Lowers Feeding Cost

Many feeders say **Milkoline** lowers feeding cost one-third, because their hens assimilate all feed they eat. Our liberal **Guaranteed 30 Day Trial Offer** enables you to try **Milkoline** at our risk—to prove that it will make you mighty good money.

Prevents Disease

Milkoline is not featured as a cure for anything or a preventative, but due to the acidity in the buttermilk it is a germ destroyer and helps keep poultry healthy, which is the best preventative against disease. **Milkoline** is invaluable as a life saver for baby chicks.

PRICES

These prices are F.O.B. Kansas City or the address of our nearest dealer. Dealers in all parts of the United States.

5 Gal. Keg	$7.50
10 Gal. Keg	12.50
15 Gal. Keg	16.50
32 Gal. Barrel	32.00
55 Gal. Barrel	49.50

Prices on smaller packages given in booklet. Buy in barrel lots—it saves you money.

Only 2c a Gallon For feeding mix one part of **Milkoline** to 50 parts of water (small feeding 5 tablespoons to gallon of water). Feed either with water or mash feed. **Milkoline** keeps their appetite keen and its action is highly essential to normal egg production. When fed as directed **Milkoline costs only 2c a gallon** or less. Trauhaft & Newman, Lankershim, Calif., say: "We would not go back feeding straight buttermilk at any price."

Guaranteed Trial Offer **Milkoline** has been producing so many amazing results and we are so certain of what it will do for you that we will ship you 1 Gallon for $2.25, **express prepaid.** Take 30 days—feed half to your poultry. If not entirely satisfied simply return unused portion and we will refund every cent you paid us. No charge for portion you have used. **Milkoline** is legally guaranteed to be satisfactory. You are always the judge. We suggest ordering larger quantity—you get the benefit of lower price—you risk nothing—you must be satisfied or we refund every cent you paid us. **Make this test now.** The sooner you begin using **Milkoline** the quicker you will be making money.

Stock hay	29.00@32.00
Oregon Cheat and Oat mixed	29.00@32.00
No. 1 Barley straw, bale	70@1.00

Citrus Markets

Los Angeles, April 28, 1920.

With a shortage of cars and the natural slowing up of shipments at this time of the year, there has been a dearth of good stock in the market. Prices have mounted and first class Navels and Valencias are commanding around $9.00 and $10.00. Large size stuff is still off.

Lemons have not been favored as have the oranges. Imports large. California growers holding back stock for better prices.

Shipments

Shipments of citrus fruit to date from Southern California since November 1, 1919: Oranges, 15,200 cars; lemons, 2,933; total, 18,133. To same date last season: Oranges, 17,801; lemons, 4,174; total, 21,975. From Central California this season: Oranges, 4,304; lemons, 286; total, 4,590. To same date last season: Oranges, 2,440; lemons, 251; total, 2,691. From Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

ESSEX MOTORS DETROIT USA

The Roadster, too, Has All the Noted Essex Qualities

Speed---Power---Endurance---Economy ---Utility. It is an ideal Car for Business as well as Pleasure

The wide uses for which the Essex Roadster is adapted in farming activities are instantly apparent.

Besides fast, comfortable communication with the city, it has many valuable utilities. The carrying arrangements in the rear deck provide space for large crates, cases, boxes, etc. But no evidence of them is revealed when the Roadster is used as a pleasure car. Every line is smart, trim and graceful. It takes but a moment to make the change.

A World Endurance Record Proves Essex Dependability

A large class of Essex buyers are farmers. They choose it for utility and dependable transportation. It becomes, in fact, a part of their business system. It must be on the job, keep all engagements on time, and be as responsible as an engineer's watch.

These same qualities, with its rare good looks, make the roadster unsurpassed as a smart car for pleasure.

Economy, durability and train-like regularity are the standards set by Essex. These things have been shown in the hands of more than 30,000 owners.

It was more dramatically proved on the Cincinnati speedway when an Essex stock chassis set the world's long distance endurance record of 3,037 miles in 50 hours. The same car, in three separate tests traveled 5,870 miles at an average speed above a mile a minute. Another stock Essex set the world's 24-hour road mark of 1,061 miles over snow-covered Iowa roads.

Its endurance and riding ease make it ideal for those who must cover wide territory, quickly and frequently. Though not large, the Essex is commodious. There is plenty of room for passengers, and its special arrangements for carrying even bulky, heavy loads make it an unusual convenience in farm service.

Come see the Essex Roadster. Ride in it. Try its paces, whether you want it for business or pleasure, you will appreciate why Essex in its first year set a new world's sales record.

POULTRY QUERIES

(Continued from Page 757.)

other grains I would feed them alone.

Another subscriber, who does not wish his name published, writes:

"It does not seem to be generally known that all stock will eat cow peas. I have fed them for years, both here and in the South, both the Blackeye and others of the cow pea family. Two years ago when beans were cheap I bought a lot of Blackeyes and Lady Washingtons. I never could get the hens to eat the Washingtons, but in three days they were eating the Blackeyes just as readily as corn or wheat. The old hens ate them the first time I fed them. I put a few in the pullets' mash dishes and in three days they ate them readily. I consider them one of the best grain foods. Hens will gather them from the vines if turned on them, and as they grow so easily in California, with or without irrigation, and make such good hay they should be grown much more for feeding. There is a variety called the Brabham (?) that is immune to the eelworm and can be cut two or three times if given water. In fact, I have grown two crops without water. It is a very rank grower, upright in growth and a good yielder of small seed."

We are very glad indeed to hear from both these men. In these days anything that can be grown at home deserves a trial.

Waste Oil for Mites

A very cheap and effective remedy for the "mighty mite," lasting longer than carbolineum or cresol and right at hand for every motor car user, has been discovered by Roy R. Mathews of Buena Park. "Secure the drainings of old used oils from your own car and tractor crankcase," he says, "or from garages, and daub with an old rag or paint brush on every inch of the roosts, the walls where the hens' bodies may touch and sides and bottoms of nests, and you will get every mite. As there is a body to these oils an application protects from mites for several months and is not injurious to hens. I believe crude oil as it comes from the well would serve as well. If this is too thick, thin with kerosene or distillate."

Sore Eyes

Every summer there appears in flocks which run at large or in confined flocks that are fed on barley a condition often diagnosed as "swellhead" or eye trouble, but which is really due to foxtails or barley beards in the eye. Sometimes these "stickers" can be seen and then they are easily removed with the fingers or a pair of tweezers. Sometimes they are in the nasal passage, and then the hen often goes blind and sometimes dies just because her owner does not discern the cause of the inflammation. W. P. Wolfe of San Ysidro has found an effective method of locating this concealed sticker. He writes:

"Whenever I notice a hen in my flock with a watery or swollen eye I take time to catch her and clean out the crevices in the roof of her mouth, for just there is where the trouble starts. Then I pull a feather three or four inches long from her wings. This feather I put first in the opening in the roof of her mouth which leads to her eye, slanting it in an angle toward the affected eye, and push it gently toward the eye. As the quill comes out of the eye I take hold of it and pull, turning it as I pull. This cleans out whatever is clogging the channel. I often find two or more pieces of barley beard on the feather. I have practiced this now for ten years in my flock and have never lost a hen when I noticed the trouble in time."

Weak Legs

We have several hens attacked by that weak leg trouble, and while I noticed your answer in the last Cultivator, still it does not seem to fill our need. Five hens have now been attacked and we have wondered if lime was lacking. We do not feed lime nor use shells, so all the lime they get is from the ground and alfalfa.—Subscriber, Runnington.

Certainly your hens need shell, and unless they are on granite soil they also need grit. Lack of lime would be responsible for the soft shelled eggs but not for inability to stand in adult hens. That is something that goes deeper. When there is stiffness, swelling or soreness of the joints, we diagnose rheumatism or tuberculosis. Inability to stand, without visible symptoms, might be due to paralysis, as I suggested in the Cultivator of April 10, but there is another disease, a very rare one, in which this symptom appears. This is a blood disease called infectious leukaemia. In this disease there is considerable temperature and death occurs in a few hours or within two weeks. I should not dare to say, without knowing more particulars, that this is what your hens have. You do not say how long they live or whether any have died. At all events it will be well to isolate the sick birds and clean up thoroughly. Infectious leukaemia is a filth disease and can only be prevented by rigid sanitary measures. There is no cure for the affected birds.

Portable Henhouse

Please give me some information in regard to small portable henhouses for use in groves.—R. H., San Fernando.

A coop we have used for several years should be satisfactory in a grove. It is six feet long, three feet wide, three feet high in front and two at the back. One side is open. It is built of 1 by 3 timber with shingle roof, and the back and sides are covered with burlap. Sometimes we have had the back and sides covered with tarred paper and the roof might be the same, but we prefer shingles. This coop will hold 20 hens. It is not suitable for rainy weather but no portable house would be.

Mating Ganders

Is my gander, ten months old, too young to mate?—Subscriber, Bellevue, Washington.

Yes, far too young. Geese are not mature till they are three or four years old and it would be foolish to mate that gander before he is two years old. You might get a few fertile eggs, but they will not hatch well, and the goslings, if they do hatch, will be small and weak.

AMERICAN EGG LAYING CONTEST LEAVENWORTH, KANSAS

FARM BUREAU EGG LAYING CONTEST AT SANTA CRUZ

Bellows Bros of Lakeside set a new weekly record for the contest, with a score of 57 eggs for their ten hens. The average per cent production for the week was 66. Five hens scored 100 per cent, while 100 hens each made a record of 85.7 per cent; 399 hens laid a total of 1,846 eggs.

High pens for the week are: Bellows, 57 eggs; Gray, 56; Wood, 56; Gibson, 56; Stailing, 55; Enterprise, 55; Barker, 52; Wallis, 51; Amsbaugh, 51.

Household Department

ARIZONA

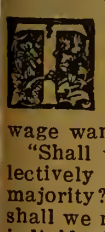
A ride across the desert on an Arizona train
Reveals some mighty wonder-works of mountain and of plain.
It seems as if some giant lifted up the hills amain,
Then tired of his burden, and let them fall again.
On one side, massive granite peaks lie just as they were hurled;
The other side lies level to the last rim of the world.
One sees the hills where Chief Cochise, with his Apache band,
Took shelter from pursuers in his fatal, final stand.
A country filled with romance—on every range a tale
Of how men fought, and built, and wrought to make their will prevail.
These men were of the sturdy type, who faced whatever came—
They never asked about the past, nor even asked a name,
They judged a man by what he did and how he bore his share
Of hardship and the seamy side of life as lived out there.
They drove the Indians from the hills, they sacrificed their lives.
To make it safe for other men to come and bring their wives.
They're gone! But in their place have come the men who grow the grain,
The cattle and the sheep and goats, to populate the plain.
These men have made the fertile land, long dry, again to bloom
With varied fruits and nuts and flowers and cotton for the loom.
Impounded waters in the hills, which erstwhile ran away,
Are waste no longer, but are used to make the desert pay
Its yearly tribute to the men who satisfied its thirst;
The waters then may flow away, yet work their wonders first.

But leave the roaring way of steel, its soft and cushioned ease,
And come with me into the wilds of Arizona, please.
I'll take you out beneath the stars, set in a vivid blue—
A blue so clear, so deep, so bright, that it will seem to you
The velvet curtains of the night have let the stars drop through:
They really seem so very close you'd like to pick a few
Out of the garden of the sky, there are so many there—
From horizon to zenith there are diamonds everywhere:
One needs no moon nor sun to shine, in this ethereal night,
For the desert in the starlight is a land of heart's delight.
What if the tall seguaro (tree cactus) throw its arms
Athwart the sky as we go by, and cause us brief alarms?
What if the barrel cactus, with its "Donofrio" air.
Give one the stark impression there are brigands everywhere?
We know they are immovable, have neither words nor mouth;
We detect old Donofrio from his leading toward the south—
We forget them and look upward to the constellations high,
And give each its designation astronomical—or try.
We watch the sunrise splendor o'er the mesa from the dawn,
Or see the hill top sun drop like a gopher in a lawn,
When night comes on so quickly we can scarcely realize
That the glory of the night-sky is again before our eyes.
'Tis a cycle of magnificence,—a wondrous twenty-four—
Nor eons of eternity may add an hour more!
We can see "the painted desert," the old Apache trail,
The Colorado canyon; we can shoot the mountain quail;
But the charm of Arizona is the desert, free and wide,
Lacking e'en the settler's cabin with the olla just outside.
To the far-flung verdant spaces, with the yucca all ablow,
And the bright-hued cactus flowers—that is where I like to go;
Where mesquite grows; and cat-claws keeps grabbing at your hat;
Where ocotillo rubber plant points now this way, now that;
Where rounded hills and spike-rock buttes invite a close inspection
Of hidden springs and other things that wait for your detection.

This land of Arizona grips you, holds you, makes you fall
Fast in love with all its wonders: If you come, you'll stay—that's all.

—The Goat Journal.

WHEN CHARLOTTE UNDERTOOK



THE Club of Fearless Women was tasting new life, for it had thought of another fearless thing to do. This was when first it had decided to wage warfare on the price of shoes.

"Shall we put it to a vote, and collectively abide by the decision of the majority?" asked the president, "or shall we make it a matter of voluntary individual pledges? The question is open for discussion before voting."

There was a short silence.

"But would we have to wear them everywhere—to church and everything?" asked a member in a far corner, aghast.

"I will reread that part of the motion," replied the president. "It provides that the members of the Fearless Club shall appear on all occasions in wooden shoes until the price of customary footwear shall have dropped 6 per cent, and until such later time as the club shall deem the purpose of the measure best fulfilled."

The members stirred and looked at one another, but without comment, until trim little Mrs. Harden said, looking at the toe of her little boot. "Then I would favor making it a matter of individual pledges."

No other expressions ensued, and it was put to a vote. The novelty of the suggestion was alluring, but the vote decreed that pledging should be individual and voluntary with the members. At its announcement there were some smiles of scorn for such recreancy.

The pledging did not follow so rapidly as the first enthusiasm for the measure had promised. The three youngest members and the president responded the first day. Others promised to reflect on the matter.

On the succeeding Sunday the prelude to the first hymn was being played in one of the city churches when there was an unusual sound at the rear of the room. Some heads turned back. The sound was lessened as the cause of it reached the carpeted aisle, and Charlotte Benton was seen making her way to a vacant seat. She walked rather queerly, and her face was deeply crimson. Some members of the congregation looked at each other open mouthed, and two small heads ducked low in the pews from which stifled snorts were heard to issue. Mrs. Hardin's small gloved hand was observed to cover her face in what seemed to be a very protracted devotion that shook her frame slightly. Charlotte Benton was wearing shoes of wood.

Had anyone but had time to notice it, her face, though nearly poppy-colored, was much less red than that of a young man who sat in the gallery. At the close of the service he waited for her at the rear of the room.

If coming into the church had been an ordeal to Charlotte, meeting this young man was a worse one. But she had been steeling herself for it, and after flinching for an instant before the dreaded disapproval in his eyes she laughed and defied it.

"Charlotte, what nonsense is this?" he groaned.

"No nonsense—just an unusual degree of common sense," she replied. "We're only used to mild doses of that, you know. This may look a little queer at first, but every improvement does."

"Do you know that the whole congregation was looking at you through out the service, and that half of them are probably hanging about to see you come out of the church?"

"Do you know what my last pair of shoes cost?" she countered.

"Is that all. And do you mean to wear these quite regularly? Because I should say it would be to the interest of the church to take up a collection and buy you a pair of shoes. The sermon would get more attention."

There was a queer little silence. Then:

"We're beginning to get acquainted, aren't we?" she laughed.

"I should say so!" he snapped.

She looked at him in a strange, composed manner.

"Charlotte," he said, with earnest exasperation. "we're not quarreling, of course. But won't you just tell me the real reason for this little freak? Was it somebody's dare?"

"I've told you, Frank. Shoes are costing so much more than they need to. It would be different if I were doing this alone. But women everywhere are considering it, and some are doing it. There have to be pioneers in everything, you know. That's what our Fearless Club is for."

"But, Charlotte," he said, flushing, "you don't have to be concerned with the price of shoes. It would be different if you did."

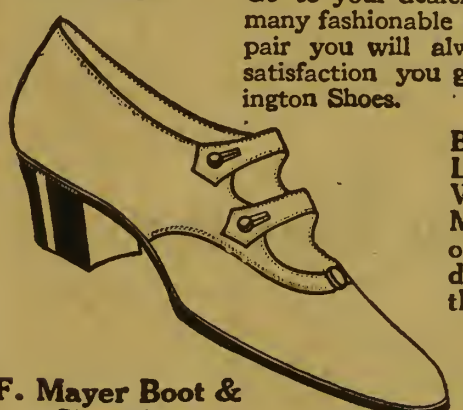
"Wouldn't it be farcical," she demanded, "if our club, organized to stand on principles instead of conventions, were to shirk this little thing they can do to remedy a wrong?"

"But other members of your club were there, and their feet were—'not

WOMEN who look for style and beauty first of all, find just what they want in Martha Washington Shoes. Late, correct styles always, and rare comfort built into every Martha Washington Shoe.

Try a pair of these famous shoes. You will like their comfort, the way they wear and the way they hold their shape.

Go to your dealer and choose from the many fashionable styles. After your first pair you will always want the complete satisfaction you get from Martha Washington Shoes.



Beware of imitations. Look for the Martha Washington name and Mayer Trade Mark on the Shoe. If your dealer doesn't handle them, write us.

This Folder Tells You How To Make Your Idle Land Earn Money

This is the day and age when you should make every foot of land produce profits for you. If you have any size tract ranging from 80 to 5,000 acres in the Western States that need development you should send for this book at once. It tells you the way to develop your property through the use of Hydro-Electric plants, gravity irrigation systems, pumping plants, grading, and buildings; in fact, it points out the various essentials that are necessary to make your ranch a producing property.

Now is the time to act, so that you can get a crop from your land next year. It is a certainty that crops will bring good prices next year, so take advantage of this condition and get your land under cultivation now.

Write today, stating location of land and number of acres.

The Modern Home Has a Player Piano

Today music in the home means more than it has ever before. A good Player-Piano brings within the reach of every member of the household the privilege not merely of hearing music but also of making it.

Picture a Player-Piano in your own home. Every evening it is played now by one member of the family, now another. The music is generally varied in character. First popular or dance music like "Venetian Moon," "Dardanella," "Karavan," etc. Then come, possibly, selections from current musical comedies, or one or two grand opera favorites and perhaps Liszt's "Second Hungarian Rhapsody," or something equally inspiring. The whole family will share in the enjoyment and the elevating influence of music.

We offer a very comprehensive stock of Player-Pianos —the Aeolian Company line (the famous Pianola and marvelous Duo Art). The prices cover a wide range. With the convenient payments terms which we gladly arrange, it is remarkable how easy it is to buy a Player—indeed no modern home need be without one.

Dealers in Steinway and Other Pianos, Pianola and Duo Art Pianos, Aeolian Player Pianos, Player Rolls, Etc.

ALFRED WARE CO., Dept. 101
Let us prove it. St. Louis, Mo.

arrayed like one of these,' " he protested, pointing to the curious shoes.

"Not all wore them. The soprano had them on, but she took good care to be in the railed choir box early. But I should be ashamed to have my name on their rolls if I hadn't stood by this."

He looked away for a while. "But you could have been in the church before the service began," he said.

She shuddered. "That was awful. I almost lost my courage when I found I would be late. Were you so very ashamed of me, Frank?"

Frank Holster colored again. "Of course it wasn't that, Charlotte. But you must see that it's rather striking, at the least."

"But I belong to a club that does striking things, Frank. Love me, love my club. We don't do them for the notoriety, as actresses and politicians do; we do them because the only thing that restrains other people from doing those things is fear, conventionality; because they're the reasonable thing to do, if you dare to really think about it. Every inventor is considered a crank, and every original thinker a madman, but why? Should they be? And if they shouldn't, why don't the rest of us help the original thinkers to push the world forward a little, or pull it back from a silly habit? And you know it is a silly habit to pay from 14 to 20 dollars for a pair of shoes. And you know that as long as we do pay it—

In this vein the little enthusiast continued till her fiance left her at her door. He had not reached the gate before he turned back.

"How long have you pledged yourself to wear them?" he asked.

"Until prices drop 60 per cent, or as much longer as it seems to be doing good."

"And what about June 4?"

She looked at him with reproach. "Why, Frank, do you think I would have risked not being free from these awkward things by then? Women everywhere are going to do it, you know. Dealers will have to take those startling tickets off their window models a long, long time before June."

"Oh, no, they won't. It takes months to organize concerted action of that kind, and then you will have to count on waiting for a supply of the wooden article. Besides, not every woman has so much heroism. Look here, Charlotte I'm not going to be married to a clattering Hollander."

She laughed, but his positive tone gave her a curious feeling.

"Not if I still am a clattering Hollanded on June 4? Of course I won't be, but if?"

"What will you do about it?"

"I won't break my pledge, Frank." She turned slightly pale.

"Which one, then?"

She was seriously troubled. "I'm sorry," she said. "I don't see how I could have taken such a risk. But I'll have to stick by this, Frank."

"Why the last pledge, more than the one to me?"

"Because this is the one I don't want to keep. I didn't want to take it. If I chose to keep the pledge I preferred, I would be in doubt of my own sticking powers always."

She looked so prettily distressed over it that he laughed tenderly and said:

"Never mind. It will come out rightly, somehow. I'm not giving up June 4."

"But you say you're not going to be married to me in my wooden shoes," she insisted. "If they're not off my feet by then, you can't keep both vows."

"We could have a quiet wedding, after all, instead of the one we planned, then."

'No, we couldn't, Frank, because that would be in a sense knuckling under on my part. I have to live up to these shoes. That's way I went to church this morning. We'll have the wedding we planned on or none on June 4. Besides, you've said that you won't marry a woman in wooden shoes, so you shan't. You'd be breaking a vow yourself if you did."

"But I've also vowed I won't give up June 4," he reminded. "There we are. We can neither be married nor not be married June 4, it seems."

She laughed. "Can't you think of a way out of that?" she said.

He could not.

"Why, I could be married to you without any shoes on."

"Charlotte!"

A phrenologist at that moment would have found Frank's "bump o conventionality" so swollen from th blow it had just received that he woul have credited its size to an undu share of that trait. But Frank wa not all made of conventionality.

"Suppose the price of shoes doesn' drop within that time. Or within year. What would you do, Charlotte Would you do that?"

"Frank Holster!" she stormed "Your conceit is positively past belief It is!"

"But what would you do?" he sai when he caught her eyes again. "Yo belong to the Fearless Club."

They were laughing eyes, but he di not seem dissatisfied with their an swer.

Time travels in a car in these days It very soon lacked but three week of June 4. No wedding invitations ha been ordered, for Frank had insiste that he would not be married to bride in such footgear.

Charlotte's entire club, a very influ ential one, now clattered unanimousl in wooden shoes.

A special meeting of the club wa called on a certain day. No one knew why.

The president, when she had calle them to order, held up a pair of shoes

"I bought these yesterday," she an nounced. "What are you going to d with me for it?"

There was a grasp of incredulity.

"Clara Worthington," said one o the members disgustedly, "if I'd bee told that one of us had weakened wouldn't have thought of you."

The president smiled at her with a fectionate mischief in her eyes. "An now, would anyone like to know wha I paid for them?" she said sweetly.

They considered. The shoes wer plain, but of excellent workmanship.

"Fourteen dollars," sai one.

"Fifteen," said another.

The president held out the bil "Seven dollars," it read.

"Oh! Mail order shoes," said on airily. She looked at her own woode ones with complacency.

"No. I purchased them at 824 Wa ton Street," smiled the president.

There was a stampede at her des for pencils. Everyone took the ad dress.

"But what about the pledged mem bers? We know nothing certain ye of the effect this man will have. H may put his prices over them all afte his opening week is over."

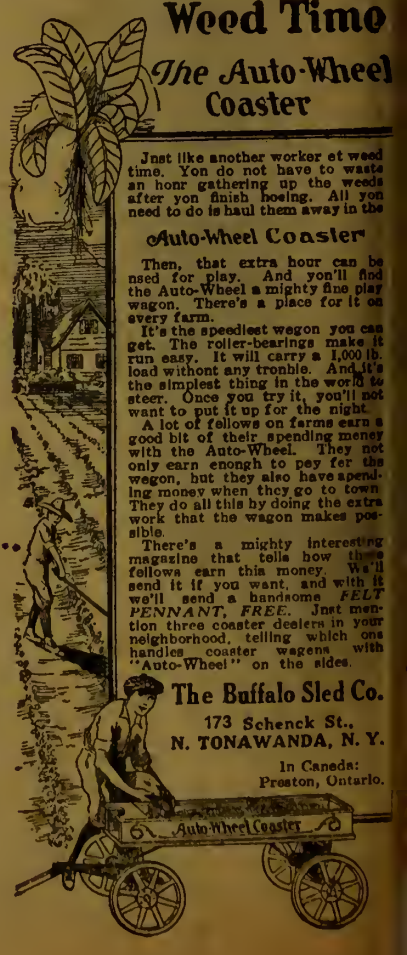
"I think not," said the presiden "He's here on principle, he declare You ought to go down and hear hi talk, women. We have won. Othe shoe men in the city will simply hav to come to his prices."

With two deft ankle movements, on of the pledged members sent her woo en shoes across the floor.

"Dear friends," she said. "I am no open to congratulations. I thoug

Weed Time

The Auto-Wheel Coaster



Just like another worker at weed time. You do not have to waste an hour gathering up the weeds after you finish hoeing. All you need to do is haul them away in the

Auto-Wheel Coaster

Then, that extra hour can be used for play. And you'll find the Auto-Wheel a mighty fine play wagon. There's a place for it on every farm.

It's the speediest wagon you can get. The roller-bearings make it run easy. It will carry a 1,000 lb. load without any trouble. And it's the simplest thing in the world to steer. Once you try it, you'll not want to put it up for the night.

A lot of fellows on farms earn a good bit of their spending money with the Auto-Wheel. They not only earn enough to pay for the wagon, but they also have spending money when they go to town. They do all this by doing the extra work that the wagon makes possible.

There's a mighty interesting magazine that tells how these fellows earn this money. We'll send it if you want, and with it we'll send a handsome *FELT PENNANT, FREE.* Just mention three coaster dealers in your neighborhood, telling which one handles coaster wagons with "Auto-Wheel" on the sides.

surely I should weaken before it was over."

"I knew you wouldn't," said another. "But I thought Charlotte might weaken about June 4. Aren't you glad——" she began, turning round to where Charlotte had been.

"Where is she?" she asked.

Then they heard her phoning in the hall. "Go down to a store at 824 Walton Street, if you can, Frank," she was saying, "and see if you find out any news. No, I'm not telling you what. No, indeed."

The Fearless Club voted to pay for and indorse a week's supplementary advertising of the new store, and invited the proprietor to speak before its next meeting.

At the end of the week his prices had wrought havoc among the gilt edged price tags throughout the city. The wings of soaring profit were clipped. Some dealers even undercut the new man slightly on featured lines; others dangled a few cents above his prices.

At the end of the week, also appeared invitations for the Benton-Holster wedding.

The event was a brilliant one. In the dining room the keynote of the decorations was the lady's slipper, for masses of which the members of the club had exhausted the resources of the city.

Among the invited guests was the new shoe merchant of Walton Street. Old friends did not understand why, until, after the ceremony, he came up to congratulate the pair.

"Mr. Snider," Charlotte said to him, "you did not know that, but for you, I couldn't have been a bride today."

Mr. Snider's eyes twinkled very small points of light. "Why, how is that?" he said.

"Because I had made a vow that I would never have a pair of wedding shoes like these"—she displayed a lovely pair— "while the shoe trade had us by the throat. And my husband wouldn't have me in my little wooden shoes."

Mr. Snider was laughing himself to tears. She looked at him with wonder.

"Is this knot tied securely and everything signed up?" asked the shoe merchant of the officiating minister.

"All is done," said the pastor.

"Then," said Mr. Snider, "don't thank me, Mrs. Holster. Thank him." He pointed to the bridegroom.

Charlotte gave her husband a look of unguarded admiration, which changed swiftly to one of mock severity.

"You!" she said.

"His capital," explained Mr. Snider. "I made up the speeches the customers got."

She gasped.

It seemed a long time before she had the opportunity to ask of Frank, "How much did the investment cost you?"

"Not half of what it was worth, dear."

"But you had to buy on the same basis as the men who sell for fabulous prices?"

"To start with I did. There wasn't time to choose new stocks, you see. I had to buy out a couple of retailers."

"Then my wedding shoes really cost you hundreds—thousands of dollars," she stormed.

"But you won, didn't you? I brought the other stores down to reason."

"No, Frank, we didn't win. Don't you see that the efforts of the club haven't brought about their natural fruits yet, if special interference stepped in? Eleanor," she called to her bridesmaid, and another apparition, almost as lovely as herself, came to her side.

"Please see that my wooden shoes get put into one of the suitcases. I am going to need them after today. We mustn't quit till we've won a victory for women. As for you, unprincipled man, your sentence will fall tomorrow, when you find you're married to little Dutchie after all."

"I don't object to the sentence, your honor," he replied. "Does little Dutchie?"

A few minutes later they rode away, and some one hurled after their limousine, as they went, a wooden shoe.—Oregon Farmer.

Soap that is allowed to dry and harden lasts twice as long as if used when fresh. Therefore it is cheaper to buy it in quantities and keep it in a dry place.

THIS WEEK'S PATTERNS

The dainty dress illustrated in 3188 is typical of the spring styles. The charming look of old time simplicity is combined with the "new silhouette." It may be adapted to almost any figure. The V neck is universally becoming; may be widened or lengthened according to thin or plump. The fullness at hips may be flattened or puffed out vice versa. It would be lovely in the soft, clinging voiles, marquisettes, or printed georgettes, or give the opposite sheer, flaring effect in organdie. Marvelously beautiful organdies are appearing in shop windows, of dark brown over brown silk slip; also dark blue, lavender, rose, etc. The browns are the newest quite, and in spite of their sheer fragility, look practical because of their lovely dark color. With flower trimmed hat of the floppy garden style you have a picture!

3198 is especially good for the stout, mature figure, equally attractive in soft wash goods, silk or wool.

The ever practical and attractive middy with kilted skirt is shown with slight variation in 3191. No girl—or her mother—can be quite happy without one or more. Make it of heavy wash material, Indian head, Devonshire, duck, denim, flannel, etc.

3199 has the flaring side pockets which daughter will like for their modish effect. This jumper-guimpe style is too practical and popular to need comment.

The two house dresses are good, as always. On the way to the office this morning I saw a lovely one in buff solid color gingham, trimmed with clear blue. Rather gay? Yes, but why not? It made one think of California's true colors, blue and gold, the blue of sky, the gold of poppies and daisies, and the altogether lovely out doorness of this wonderful springtime.

The little girl's dress, 3200, is simply irresistible. Can't you just see your plump, happy little girl in that dress of sheer white or soft solid color chambray, with its graceful drop yoke and dainty insertion?

Then the little house dress, 2813, made just like mother's, will be a delight to the little daughter who is going to be mother's helper. Maybe it will make dish washing and dusting a rather nice game.—R. P. D.

ANGEL FOOD

The Cultivator is glad to give a recipe for angel food which is vouched for by a friend as "simply heavenly." Here it is:

Whites of 8 eggs, 1¼ cups sifted sugar, 1 cup sifted flour, ½ teaspoon cream tartar.

Sift a little salt over whites, beat until fluffy. Put in the cream of tartar and beat until very stiff. Sift the sugar and flour separately and fold the sugar in first, then the flour. Bake in a moderate oven until it rises to the top of pan. Then put on more fire and bake for about five minutes. Use "pipe" cake pan.

Perfect Icing

1 egg white, 1½ cups sugar, 3 tablespoons water. Place in the double boiler, having the water boiling in the under pan. Beat with a Dover beater for five minutes. Spread on cake. (Cake should be cool.)

TO CLEAN NEGLECTED STOVE

Where the cook stove has been badly neglected a solution of any good washing powder in boiling water, applied with a scrubbing brush, will remedy the greasiness. After the scrubbing rinse thoroughly with clear water and wipe dry. The tarnished nickel may be improved by a brisk rubbing with steel wool. This is obtained from a paint or hardware shop. If this does not clean and polish, the nickel will need to be taken off and renickled at a foundry.

RAISIN BUNS

One quart flour, one half cup sugar, one-half teaspoon salt. Sift all together. In the meantime scald one cup milk and add a good sized teaspoon of butter. When lukewarm add one-half yeast cake and mix to a soft dough. More flour may be added to the dry mixture after sifting. Put these to rise about 9:30 or 10 a. m., and at 4 they will be ready to form into rolls. Put into pans a little bit apart. Let rise until light and bake in hot oven for about 15 minutes.

Any woman so capable and clever as to make her own and her children's clothes deserves better than an out-of-date, hard running sewing machine to work with.

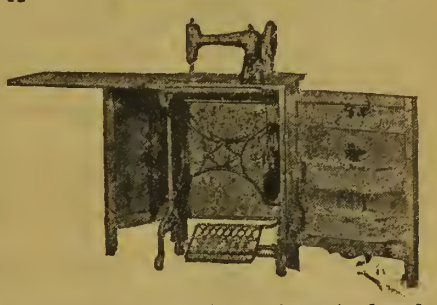
No matter how pleasing the patterns selected, or how beautiful the materials, it is Drudgery, and nothing else, to sew on an old awkward machine incapable of fine adjustments or good sewing. Such a machine takes the economy as well as the pleasure out of home-sewing. Besides it is a menace to good health and good dispositions.

It is easily possible to get the full present worth of your old machine and forever rid yourself of its many shortcomings. Trade in your old machine on

THE
"FREE"
SEWING MACHINE
Guaranteed For Life

and begin enjoying and profiting by the uses of this machine called rightfully, for its many perfections, "The Sewing machine of Today."

Two Illustrations of the "FREE"



In the illustration above, the unique and satisfying features of the "FREE" cabinet are shown, with the case open and extended. On the left is the same machine closed when not in use. In the "FREE" all the old, time-worn defects of imperfect sewing machines have been eliminated.

The "FREE" has these proven advantages:

It sews faster; it runs lighter;

It lasts longer because it has less vibration;

It makes an absolutely perfect stitch;

It is easier to operate; and lastly,

It is a beautiful piece of furniture.

Barker Bros. will accept your old machine in part payment on a "FREE" and will allow convenient payment terms on the balance.

If you want to know how to get full present value for your old machine, applied on the purchase of a "FREE"—and at the same time enjoy Barker Bros. convenient payment terms on the balance, write us fully, describing the make, condition and age of your old machine, and we will tell you how you may easily and quickly begin to enjoy sewing on a "FREE".

Every possible safeguard is taken to insure the uniformity of Sperry Poultry Feeds. Not only do our chemists make daily laboratory tests, but practical tests are going on all the time at our Experimental Farm.

— so that you'll KNOW what you're feeding

LONG before the present feed law became effective, the manufacturers of SURELAY recognized the right of every feeder to know *what* he was feeding his flock. That's why the exact analysis was printed on the back of every sack.

There is no secret about SURELAY—or what it will do. It is based on a practical formula that has made this top-grade feed a prime favorite among successful poultrymen. It contains at least a dozen ingredients balanced and blended more skillfully than can possibly be done by hand. Our daily laboratory tests (an advantage that the hand-mixer cannot have) assure *absolute uniformity* day in and day out.

In this way *we* know just what goes into SURELAY—and *you* know just what you're feeding. No guess-work about it! You know that every pound, every sack, you buy contains the *exact* ingredients your hens need to bring about the greatest egg-production in the most natural way.

Our booklet, "Makes Hens Happy," is a helpful handbook you ought to have. Full of many profit-hints and poultry pointers —and its free! Simply fill in the coupon and mail today!

Where Part of the Cars Were Parked

The twelfth annual picnic, held at the university farm, Davis, April 24, drew one of the largest crowds in the history of the event. Picnic day is an annual event, held each spring, by the student body of the college of agriculture, and serves to bring the public in close relation to the institution.—Photo by McCurry.

University Farm Picnic. Parade and Part of the Crowd

The only horses noticed at the last picnic held at the university farm were in the parade. Maybe a few visitors arrived on the trains, but most came in their cars, a few by aeroplane.—Photo by McCurry.

PATRIOT

Motor Trucks

This is one of the tests of the Washington Model Patriot Truck, capacity 5000 to 7500 pounds.

Circling through a freshly plowed field, with a load of 7000 pounds besides the body, every wheel cutting its own track. Try this with any other truck you know.

More power in trucks is the vital need of the farmer, and this is what the Patriot provides.

The Writing on the Wall for Cattlemen

By A. L. Spellmeyer

THE Year Book of the department of agriculture, 1918 issue, on page 290 gives us the information that in the year 1900 there were 89 cattle, all kinds, to the 100 of human population, and on January 1, 1919, 64. Since then more people and less cattle.

The same source gives an approximate slaughter record under government inspection of cattle, January 1, 1918, to January 1, 1919, 10,938,287, and of calves, 3,323,077, or a total number of over 14,000,000 cattle. Exports approximated in beef weight the equivalent of about 1,000,000 cattle. It is very probable that some 4,000,000 additional cattle were killed throughout the U. S. A. on farms, ranches and in local abbattoirs, not under government inspection.

Statistics are at times misleading, but their general trend will show fact, and the disparity of margin is so great that there is little doubt that a national cattle shortage is imminent in this country. It can be safely assumed that the men who decry such a conclusion are either ill informed or lined up with a packer propaganda, as the writing on the wall is plain to read and unless more cattle are raised or less killed, the shortage will bust the low price lid upon which the packers are heavily sitting at the present time.

The world is short of food, Europe is consuming the Argentine surplus and Australia has been drouth stricken. Production in this country has been badly injured through drouth and lack of profit and the price forays upon a manipulated beef market, and if there is any doubt concerning the general veracity of the government's cattle estimates it is probably because the number at present is overestimated, but there is no doubt of the actual record of animals killed and inspected.

The new report, December, 1919, of the federal trade commission, Part VI, gives pertinent facts regarding the growing cost of cattle, gathered by observation from many ranches and districts, and it is not your opinion nor mine, but cold, impartial fact. A calf crop of 57 weanlings from 100 cows is a good one for an average in this U. S. A., and one ranch which did make an 80.9 per cent calf crop from 100 cows had a calf cost at weaning time of $48.41 per head.

Now you have the official cattle numbers in this country, which approximated 45,000,000 beef type cattle and 24,000,000 dairy cattle, you have a probable slaughter number of 18,000,000, and the fact that the average calf crop raised to weanlings is under 60 per cent of cows run. And you have the additional fact that from 1907 to 1917, or for ten years, the average number of cattle slaughtered under government inspection approximated 9,000,000 cattle and calves, and in that ten years beef cattle numbers decreased from 51,000,000 to 41,000,000. The reported increases of a few million beef cattle in 1918 and 1919 are without doubt due entirely to closer taxation, and do not exist, although the dairy cattle have increased. But we finish in 1919 with some 4,000,000 less cattle of all kinds than we had in 1907, and it was in 1907 and 1908 that cattle started to advance due to known shortage.

For the last few years we are exactly in the position of a man living on his principal instead of his interest. An accounting cannot be long deferred, and there is no question but that facts and truth are known and realized by an overshadowing meat oligarchy, still in active operation, and that prices are being manipulated and held down.

It is probable in the cry for lower living costs such a course is being mistakenly fostered and encouraged by authorities who fear that higher prices to producers will mean higher prices to consumers.

Let us be conservative, not forgetting that in the ten years from 1907 to 1917 we ran behind in our total cattle numbers 4,000,000 head, with an average killing of some 9,000,000 government inspected.

Let us figure a total slaughter of this 9,000,000 and 3,000,000 outside of inspection, and see how much of a herd we must have (and figure 80 per cent calf crops) to maintain numbers and kill 12 head yearly: 12 twos steers, 12 yearling steers, 12 yearling heifers, 24 calves, 30 cows and twos heifers, 2 bulls. A herd of 92 cattle—and we have forgotten all about such things as loss, number maintenance, etc., or nationally figured 92,000,000 cattle to stand killing of 12,000,000.

If this is the case and you have followed such a dry subject as figuring this far, the natural inquiry is how cattle stood the average of 9,000,000 killed under government inspection and several million killed without it for ten years with only a decline of 4,000,000 total and with only a decline for that ten years in beef cattle from 51,000,000 to 41,000,000, to 1917 inclusive.

The answer accords with many of the objections of the men who think cattle supply adequate and even that a surplus exists, viz., that the government numbers were wrong and that, figuring in small units, a herd of 72 cattle did permit an annual slaughter of an approximate 12 cattle and only decreased 68 head, counting beef and dairy grades together, in ten years. If the government figures were wrong in 1907, why are they not wrong in 1919 or 1920?

But this we must not forget, that owing to war needs and taxation, great care was taken in recent food surveys; every assessor figured numbers of livestock closely, and people who previously were tax dodgers turned in their actual numbers. The efficiency of close estimation, of income tax, and of all war collections caused apparent increases in cattle which in actual fact were misleading.

Any way it is figured the fact stands forth that if this nation could not maintain its cattle numbers with 72,000,000 supply in ten years with a slaughter of only 9,000,000 to 12,000,000, it certainly cannot do it with less than 70,000,000 and over 14,000,000 slaughter under government inspection alone. 1920 figures show total cattle decrease of 500,000 head.

It won't be many years when the lid will come off of this cattle problem, and the country has no time to waste if it figures cattle as necessary for food, clothing or soil maintenance. Shortage is being catered to by continued price forays, and it is indeed a serious condition and indicates the attitude of food controlling forces when cattle producers cannot even make a living profit and meat is at the highest point in our history for the consumer.

What is the Citrus Experiment Station Worth?

By Fred M. Reed

THE writer is a near neighbor of the citrus experiment station at Riverside and also a rank and file member of the class of people generally known as "practical farmers." The term "practical farmer" seems to apply to people who have been engaged in farming for indefinite periods of time and who have made good at least to the extent that after spending most of their lifetime in the business they have not failed entirely and have some property to show for their work. Conversation among this class of men frequently leads up to the subject of the local station, and it is an interesting study to note the remarks and criticisms made by them about the station, its staff and its work.

Some farmers are seemingly hostile by force of habit and have never even looked for any benefit from the work of the station. Another great class of farmers has no knowledge whatever of the station nor of its staff, much less any idea of the problems that it is investigating. It is a safe guess that of all the citrus growers of Southern California 50 per cent belong to this class. Then there is, of course, a considerable percentage who have enough interest in the institution to visit it, to apply to its officials for information and help and to keep track of the results of its investigations as given out from time to time.

The objections of the hostile critics among the farmers seem to fall along the following general lines: They say the station is manned by "school men" of little or no practical experience as farmers and that their training and habits of work are such that they could not make a living in the citrus business if left to their own resources. They say the station groves are not a commercial success and do not produce sufficiently to make them a paying proposition on the best plots they have. They say the business management of the station is extravagant and that if a "practical" farmer were to run his property on such lines he would soon come to the end of his string. They say, also, that the statements of the staff both in printed publications and at public meetings, such as institutes, are vague, inconclusive and indefinite: They say several other things, but these are a fair sample of what some so-called practical farmers say about the station. When the writer has heard ten who were getting these criticisms out of their systems he has possibly heard one who recognized or spoke in praise of the demonstration of the effect of continued use of nitrate of soda, the demonstration of the necessity of available nitrogen in fertilizer, of the investigation of the best plants for cover crop purposes, of the demonstration of a practical treatment for "scaly bark gum disease," of the continual control and research in the work of fighting scale and other insects. Few of these volunteer critics speak of the value of having a staff of trained men within reach when new troubles show up in the citrus business. The cost and expense of the upkeep of the station is often dwelt upon as being out of all proportion to the results, but we have never heard anyone remark that the little kingdom of Denmark maintains some 28 agricultural experiment stations and schools. One seldom hears about the untold millions that have been spent and mostly lost by the successive waves of settlers in California who had no one to ask for advice except the real estate agents and the neighbors, as to what, how, when and where to plant. How many experiment stations could be equipped with the money that has been unnecessarily spent for potash in commercial fertilizers? In the future how much more productive will the average citrus grove of the state be in view of the demonstration by Dr. Webber in regard to the selection of seedling nursery stock? While it may be true that the aforesaid criticisms of the station will not do any great harm in the long run, it is equally true that great good would follow if a larger proportion of citrus growers could be put in closer touch with the work and results of the experiments at the station.

Agricultural News Notes of the Pacific Coast

Northern California

Chico will hold truck and tractor demonstration May 22.

Hop prices are hopping, some growers holding for as high as $1.25.

The university farm is planning for a tractor short course to begin June 1.

Santa Rosa honored Luther Burbank by May Day celebration and pageant.

Eldorado County farm bureau will erect fruit dryer of six tons capacity.

Mendocino County farm bureau members are discussing long and short pruning.

Sacramento canneries will turn out at least $15,000,000 worth of canned goods this year.

Florin, Sacramento County, will ship over a half million dollars worth of strawberries.

Santa Rosa hop growers have refused 80 cents per pound for the coming season's hops.

Great extension of berry fields will be made by berry planters of Paradise, Butte County.

Stockmen's Protective Association held a meeting at Livermore, Alameda County, last Saturday.

R. P. McCune of Paradise, Butte County, is to be the new president of the county farm bureau.

Serious injury was visited upon many almond orchards of Butte County by heavy winds last week.

A meeting of irrigation district representatives is to be held in Oroville, Butte County, Saturday of this week.

Mendocino County's precipitation for the season was about 17 inches, over four inches of this coming in April.

Over 207,000 trees have been added to Sacramento County orchards this year, Horticultural Commissioner Brosius announces.

The department of the interior has ruled against cutting the rim of Lake Tahoe and taking the waters for irrigation in Nevada.

Sheepmen of the Sacramento Valley are reporting extreme shortage of feed. Some growers have been compelled to sell their stock.

Irrigators are again asked to return to night and Sunday pumping so far as possible to conserve the current for industrial uses.

The movement for a new irrigation district in Alameda County, especially including lands near Livermore, is gaining supporters.

Governor Stephens is calling for purchase of a liberal number of the state highway bonds which are not selling because of Coast money market.

Tehama County farm bureau centers: Antelope, May 11; Dairyville, 12; Oak Park, 14; Richfield, 17; Bend, 21; Los Molinos, 24; Proberta, 26; Mantone, 28; directors' meeting, Red Bluff, 22.

The first California cherries shipped East this year sold in Chicago at $10 a pound, according to word just received by F. B. McKevitt of Sacramento, who shipped the fruit from his orchard in Vacaville.

Horticultural Commissioner Sherrard of Tuolumne County is able to prove to the farmers in the most emphatic way the value of squirrel eradication by the showing of crops in squirrel free sections compared to those ravaged by the pest.

Central California

San Jose reports apricots hard hit by frost.

Terra Bella, Tulare County, is organizing farm bureau center.

Fresno held a commercial car show last week and early this week.

Oakdale, Stanislaus County, farmers are building a cooperative garage.

Stanislaus County farm bureau is encouraging cooperative cold storage plant.

Porterville, Tulare County, held historical pageant, picnic, and made a holiday on May 1.

Canneries are hard hit by the sugar prices but report normal pack will be put up this season.

Tulare County reports the first cutting of alfalfa already stacked, of fine quality and a heavy crop.

The rate on irrigation water this season in the Tulare district has been fixed at $1.50 per acre irrigation.

Weed Patch, Kern County, farm bureau center has committee working on problem of cold storage plant.

The boys club of Kern County will hold sale Saturday, May 15. There will be 60 head pure bred hogs offered.

Los Altos, Santa Clara County, reports narrow escape from injury from light frosts in tomato and fruit growing sections.

Engineers have reported unfavorably on the proposed formation of five Miller & Lux and Mordecai irrigation districts.

The San Joaquin Counties Association is planning improvement of its exhibit in the state exposition building in Los Angeles.

Stanislaus County grain crop, especially wheat, is proving larger and of better quality than appeared possible early in the season.

San Joaquin County farm bureau cow testing association reports liberal proportion of cows running from 1 to 1.7 pounds fat per day.

Tulare County dairymen are building silos as never before. Barley is being used as ensilage. This will be fed out and corn silage filled later.

Warehousemen have applied to railroad commission for permission to increase charges, maintaining that labor and other expense compels it.

Los Banos, Merced County, as well as other West Side sections, reports serious loss of moisture from drying north winds. The hopes of many a grain farmer have been destroyed.

Apple shippers of Pajaro Valley, Santa Cruz County, are offended because of articles in Eastern papers which make what is charged "false and malicious attack on a California industry."

Santa Cruz County sealer of weights and measures has ruled: "When green peas are sold or offered for sale in sacks, such sacks shall contain not less than 68 pounds; that is, when such sack of peas is mentioned as indicating quantity sold."

Tulare County dairymen received over $230,000 for milk delivered at creameries for month ending April 15. The following prices obtained: L. A. Creamery, sour cream 70½, sweet 72½; Good Luck, sour 69, sweet 74; Dairymen's Cooperative, average 71.

Southern California

Ventura County has a county chamber of commerce.

Walnut growers are dusting orchards for the aphis.

The asparagus shipping season of the Imperial Valley closed with April.

Cucamonga, San Bernardino County, will have dehydrating plant for wine grapes.

Orange County's planting of beans will be 8,000 acres short of that of last year.

The minimum wage of women working in canneries in California will be $16 per week.

Imperial County farm bureau observed May Day with a farm home department picnic.

Fillmore, Ventura County, celebrated May Day with picnic and exhibition of products.

Arlington, Riverside County, Poultry Association is discussing brooders and brooding methods.

Mark Rose has been chosen by Holtville irrigators as irrigation director on the Imperial irrigation board.

Perris Valley, Riverside County, is planning to secure water from Warner's Ranch to cover at least 40,000 acres.

Lake Elsinore has been purchased by interests which will erect hotels and make of the section a greater health resort.

A Cotton Growers Association has been formed in the Imperial Valley. It will have to do with labor, marketing, or any problem of its members.

The melon shipping season of the Imperial is beginning, and during the next 60 days 14,000 cars of cantaloupes are expected to go out of the valley.

Several cotton growers of the Salt River Valley of Arizona have purchased a large tract in Blythe, Riverside County, and will grow long staple cotton.

The El Cajon, San Diego County, farm bureau center recently demonstrated the work of gopher eradication and held afternoon and evening social sessions.

"More refrigerator cars" is the cry from Imperial Valley. Cantaloupes are all ready for shipping and the loss will be very great unless a far greater number of cars is secured.

Imperial Valley cotton growers are petitioning the gins to finance aud render such aid to cotton growers as will enable them to handle the coming labor shortage economically.

Imperial Valley now has a cotton expert who is employed by the Goodyear Rubber Company, but will give much of his time to giving information where desired in cotton culture.

The Arrowhead Springs Hotel purchased by the federal government for $700,000 will soon be ready to receive patients in returned ex-service men. Most of the patients will be those who have suffered from shell shock.

Secretary Brooks of the Poultry Producers of Southern California is making addresses before poultry associations, giving information as to egg markets and production of a thoroughly standardized egg. One week's shipment of eggs recently totalled 43,000 cases, or 11 cars.

The Coast and General

National Wheat Growers Association recently met at Kansas City.

Lane County, Oregon, is conducting a $2,000,000 road bond campaign.

Cattle and Horse Breeders Association will meet at Burns, Oregon, May 24 and 25.

A hop grower at Aurora, Oregon, recently sold his 1920 crop of hops to an English concern for 37 cents.

Sheep shearing has started in Nevada. Large herds of cattle and sheep are being sent to northern pastures.

A farm in Chandler recently sold for $1,000 an acre. This is believed to be the record price so far for farm lands in the Salt River Valley.

An association has been formed for the improvement of the Apache Trail from the base of the mountains east of Mesa to the Roosevelt Dam.

Sheep shearing in the desert sections of Southern Arizona is practically over. The wool this year is said to be of exceptionally good quality.

Frank W. Hanna of the United States reclamation service is prominently mentioned as successor of W. R. Elliott, the present Salt River Project manager.

Some cotton has recently been sold at $1.35 a pound. This is the top price so far received by the grower for American Egyptian cotton in the United States.

Mesilla Valley Cotton Growers Association with headquarters at Las Cruces, New Mexico, will establish four gins; at Las Cruces, La Mesa, Anthony and Ft. Filmore.

Nearly 4,000 acres of land in Graham County in the Gila Valley will be planted to cotton this year. This is by far the largest acreage of cotton ever planted in this section.

Idaho and Utah beet sugar growers have a sliding contract with factories which provides $12 per ton minimum and $1.50 per ton increase for every cent increase in the price of sugar above eight cents a pound at seaboard during the year.

Mormon Lake in Northern Arizona is increasing in size. Thirty years ago there was practically no water there; now the lake covers ten sections of land. The lake is said to have raised six feet since last summer.

A plan is being proposed by W. S. Norveil, state water commissioner, for increasing the acreage of walnut trees in Arizona. Considerable work is being done under his supervision in grafting the Franquette variety of walnut on the native black walnut tree.

The exhibits and farm products which have been displayed at the Phoenix chamber of commerce, a part of which were shown at the International Soils Products Exposition at Kansas City last fall, have been divided among the other commercial organizations of Maricopa County.

The Arizona commission of agriculture and horticulture has recently adopted more stringent precautions regarding the introduction into the state of cotton lint, linters waste, seed or any product or commodity which has been used in connection with cotton or is a product of cotton, in order to prevent the introduction of the cotton boll weevil or the pink bollworm of cotton.

Grape Mildew and Its Control in California

By F. Flossfeder

CALIFORNIA is very fortunate in its freedom from most of the serious fungous vine diseases which do so much harm and cause so much expense and uncertainty of grape growing in Europe and other parts of the world. However, there is one fungus, the powdery mildew (Oidium Tuckeri-Uncinula spiralis), which when not controlled at the right time and in the proper way will very often cause serious damage in our vineyards.

This fungus, which belongs to the group or family of Erysipheae, is a native of America, from where it was introduced into Europe and noted for the first time in 1845 in a grape house in Margate, England. Two years later this fungus had spread to France and Belgium, and at the present time it is found all over the world where grapes are grown.

In California the oidium has never produced such widespread and serious injury as it does in France and other European countries. This is due to the dryness and heat during summer of the atmosphere of our grape growing districts. The dryness of our climate is undoubtedly the cause of our immunity to Peronospora, which can only germinate its spores in water. We very often find that in certain seasons the attacks by the disease (oidium) are more intense than in others and that a great deal more damage is done to the leaves, shoots and fruits than we suspect. Indeed, in certain districts where the moisture condition and heat are right for the development of the fungus, not seldom the whole crop may be lost. For this reason we should look out for this trouble as early as possible and eradicate it by use of sulphur.

As before said, this fungus infests all herbaceous portions of the grapevine. It goes through the winter in the "perithecia" form, containing a certain number of small sacks called "asci," and these latter contain the spores. The perithecia can be found on the canes of any grapevines badly infested with mildew during the winter, and also in the soil. The perithecia, or winter spore, is very resistant and as experiments have shown, excessive moisture and low temperature will do it no harm whatever. As soon as the temperature rises and the moisture conditions are favorable, the winter spores break open, emitting the spores, which are small single celled bodies filled with protoplasm. These spores when deposited on herbaceous portions of the vine will form a tube which will soon branch and we get what is called the mycelium, which consists of a very large number of branching threads running in every direction and having a grayish appearance. The mycelium is attached to the leaves or any other green portion of the vine by its haustoria, which penetrate the outer cells and by which the fungus obtains its nourishment from the host plant. The dark fernlike markings which are very often noticeable on the canes of the dormant vines in the winter time were caused by the mycelium when the shoots were young. As soon as the shoots of the vine are attacked they turn grayish white in color. The tip is turned downward. The leaves are attacked from the lower and upper surface and turned inward. Everything will look grayish white, and if we place a portion of the leaf under a microscope, we will find that this coloring is caused by the large number of branching threads, by hyphae and summer spores. The berries are attacked when green. The result is that the outer layers of the skin are destroyed by the haustoria. Finally the berry breaks open and will either dry out or rot, and the latter will infect the neighboring berries, and the result will be that the whole bunch of grapes will be destroyed.

Very often we have the mildew in our vineyard, but do not notice it until it is too late, and for this reason we should keep our eyes on the vines, examining them very often and carefully, not by looking at the vine from a distance but by going right into the center, and if there is any mildew present we certainly will find it there. Grapevines growing in the shade of trees or buildings are more easily infested than others standing in the open field, due to the fact that the conditions here are more favorable for the growth and development of the fungus.

It must be borne in mind that there is a considerable difference in susceptibility in the various species and varieties of grapes. All American vines such as the Labrusca, Riparia, Rupestris, etc., are much less severely attacked than the varieties of the European species, Vitis vinifera, L. Among the latter there exist, however, various degrees of susceptibility. The Carignane, Flame Tokay, Valdepenas, Muscat of Alexandria, Cabernet, etc., are very susceptible to the disease. For this reason, if we have two or more varieties of grapes growing, it is of the utmost importance to examine all the varieties thoroughly.

The only remedy we have in the control of this fungus is sulphur, which acts by means of the fumes it gives off when the temperature is sufficiently high. The sulphur fumes destroy the mycelium and the summer spores, and when present in sufficient abundance will destroy every vestige of the fungus in the vineyard except the perithecia or winter spores. The sulphur fumes are given off in effective quantities when the temperature of the air reaches about 75 degrees Fahrenheit. Above this point they are given off more actively the higher the temperature. The lower the temperature the more slowly the fungus is affected. If the highest shade temperature of the day is between 75 and 80 degrees Fahrenheit, it will require from seven to eight days to destroy all the mycelium. When the temperature rises to 90 degrees Fahrenheit the fungus commences to show signs of injury in 24 hours and in four or five days is destroyed. If the thermometer rises to above 100 degrees Fahrenheit in the hottest part of the day, one or two days are sufficient to completely rid the vineyard of the disease.

In order to obtain these perfect results, however, the sulphur should be applied to every part of the vine. The nearer a spore or a piece of mycelium is to a particle of sulphur, the quicker it is killed. There should be no square inch of leaf surface without sulphur, for except in the very hottest weather the sulphur on one leaf will be of no good to the neighboring leaf. We should take good care not to forget to sulphur the center of the grapevine, for it is here where the mildew is very frequent. The sulphur is best applied in the morning when the leaves are more or less moist with dew. It is much less effective when the leaves are wet, as the drops of water have a tendency to gather the sulphur into patches, which will leave parts of the leaf untreated. Grapevines should not be sulphured in very windy weather, as most of the sulphur will be driven away by the wind and fall on the ground, where it will be wasted.

The proper time for sulphuring will depend on the number of sulphurings needed, and this number will differ according to locality, weather, variety and the exposure of the vineyard, and will vary from one to three in the interior valleys, and from two to five in the coast counties, or even as high as six or seven with very susceptible varieties in bad seasons. The first sulphuring should be given when the young shoots are about eight to 12 inches long, and the second when the vines are in bloom.

It is true that we do not need to sulphur our vines when there is no mildew present, but it is just as true that a good many grape growers neglect to sulphur their vines because they are under the impression that as there was no mildew last year there will be none this year. This, however, is a great mistake. In order to be on the safe side we should go through the vineyard once or twice every week and make a thorough examination of our grapevines in every portion of the vineyard, bearing in mind that one variety is more susceptible than another and that those vines which grow in the shade of trees or buildings or along irrigation ditches should be given double attention.

The methods used in California for sulphuring vines are the following: Throwing the sulphur on the vines by hand; distributing by perforated cans of various forms; shaking through the tissue of a cloth sack; various forms controlled by any of these methods of hand bellows; various forms of knapsack bellows, and power blowers driven by a small gasoline engine. Both blower and engine are mounted on a vineyard truck.

That the disease can be completely controlled by any of these methods cannot be denied. However, they differ greatly in amount of labor, sulphur and care necessary in applying. If it is only a question of a few vines which have to be sulphured, there is no reason why the first three means of application should not be used. However, if we have to sulphur extensive vineyards we would not be able to use the latter forms of applying because about 90 per cent of the sulphur used is wasted, falls to the ground, where it will be of no benefit to the grapevine. The hand bellows is a fairly good method, but it is slow and very tiring to the arms of the man using it. The best of all are the knapsack bellows, also known under the name of dust sprayers, sulphuring machines, etc. These machines are made in America and Europe, and there are several good machines on the market. With these it is possible to cover the whole grapevine with a cloud of sulphur dust and do the work in a very fast and efficient way. Power blowers are more or less wasteful with the sulphur, but owing to the high wages which are paid to all kinds of help at the present time, it may be a paying proposition in large vineyards to use a power outfit which will do the work very rapidly, and the price of the sulphur wasted is very small compared to the increase in wages paid to the men doing the work with knapsack machines.

It is by no means a matter of indifference what kind of sulphur we use. There are a good many different brands of it on the market, some of them good, others bad and useless for this kind of work. If we wish to get the maximum amount of efficiency we should use nothing but the very finest sulphur which we can buy for the sulphuring of grapevines, and this will be the sublimed sulphur. It is true that this is the most expensive, but experiments have shown that it is the cheapest in the long run. It is not of so great importance how much sulphur we put on the grapevines as it is to have the powder as evenly distributed as possible all over the vine, and this can be done with the finest sulphur only. Sulphur fumes, atomic sulphur, bluestone solutions of various strengths applied during the winter, and other so-called patent sprays have been recomemnded for the control of grape mildew, but experiments carried out by this station have shown that finely ground or sublimed sulphur have given the best results.

Cantaloupes in Imperial Valley

By F. W. Waite

IMPERIAL County raises more cantaloupes than any state in the Union, and we are now on the eve of handling the largest crop in the history of the county.

Going back into history for a few minutes, we find that water was first turned into the Colorado Desert, now Imperial Valley, in 1901, and in 1905 there were 297 carloads of cantaloupes shipped, 577 in 1906, 644 in 1907, 1,891 in 1908. It might be of interest to mention that the crop for this year was very disastrous to the growers; many of them were in debt to the shipper after a year's hard work. Note the comparison: 1,891 cars for the year 1908, making a total loss, while in the years 1916-17-18 and 19 they averaged a profit around $300 per acre, with a total shipment in 1919 of over 8,000 carloads, due to improved methods of marketing under federal management and standardization.

In 1909 there were 1,411 cars shipped, in 1910 1,621 cars, 2,580 cars in 1911, 2,887 cars in 1912, 3,502 cars in 1913, 4,451 cars in 1914, 4,721 cars in 1915, requiring 8,500 planted acres to produce this number of carloads.

In 1916 there were 8,600 acres planted from which 4,617 carloads were shipped, the first car expressed on May 16. In 1917 there were 12,776 acres planted and 5,080 cars were shipped. From 10,942 acres planted in 1918 4,405 cars were marketed, 8,802 from 14,088 in 1919 and this year,

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Does the young California farmer spend the day before the picnic washing up and polishing his neat little piano box buggy, braiding the roadster's mane and tail and trying a blue ribbon on the buggy whip? He does not.

Note the upper of the two illustrations on the cover page of this issue. That's a California picnic scene in 1920. There wasn't a piano box buggy entered the grounds that day, but there were gas wagons until they couldn't be counted—literally thousands of them.

These are swifter than were the days of 1880 or even '90 or 1900. We are living faster; we are seeing more; we are accomplishing. To gas is due a portion of the credit, more to American genius and American push.

SULPHUR THE GRAPES

We do not know how much it costs, but the high cost of living has nothing on the high cost of mildew in California vineyards. Prof. Flossfeder writes about it in this issue and shows how exceedingly simple is the method of control. According to the methods suggested by Prof. Flossfeder's article, we may use a small gasoline engine with power blower or knapsack bellows or a pepper box or a cloth sack or, in the absence of all the improved methods, scatter the sulphur by hand, but in any case, use the sulphur.

WRITING ON THE WALL

Near the end of Mr. Spellmeyer's article he says: "It won't be many years when the lid will come off of this cattle problem, and the country has no time to waste if it figures cattle as necessary for food, clothing or soil maintenance."

The worst of it is that Mr. Spellmeyer isn't "seeing things"; neither is he naturally pessimistic. His article contains a world of information regarding the cattle situation. Cattlemen haven't had a fair deal and they know it. Worse, they know they are losing money, and the result will be to the cattle business the same as it would be to any other business—a continuous money loser is going to quit the game. He can't always continue to live on his principal.

INCREASING PRODUCTION

The British ministry of agriculture is endeavoring to secure a great increase in food production. It has appointed agricultural organizers, horticultural superintendents and other educators to go into the field and in a way carry out America's farm bureau county agent idea with the producers of England. At present there are being held farm institutes offering winter courses to boys and summer courses to women. There are 14 agricultural colleges in England, every one of which is turning away students who wish to register. British food imports amounted last year to over $3,000,000,000. It is hoped to reduce this great importation by at least $1,000,000,000 by this campaign of greater food production.

CANTALOUPES

If anyone is inclined to ask as to whether California produces cantaloupes it will be of interest to note Mr. Waite's article on page 769. Mr. Waite does not touch upon all of California; in fact, he is covering only his own county way down next to the Mexican line. This season Imperial County has planted 21,920 acres from which there will be shipped some 11,000 cars, and that all within the next 60 days. That is, there will be shipped that number of cars, providing they can be had. The growers are now wondering as to whether car shortage may not compel them to leave 5,000 or 6,000 carloads of magnificent fruit to rot on the vines. Besides the Imperial, other melon centers are the Coachella Valley of Riverside County, several small valleys near Los Angeles, and then for later melons, the great fields of Stanislaus and adjoining counties.

QUARANTINE BOARD

The Western Plant Quarantine Board, which held its first meeting, and in fact organized, at the time of the state fruit growers convention at Riverside, will hold its second meeting at Salt Lake City next week, Tuesday, Wednesday and Thursday. This organization is made up of quarantine officials of the Pacific Coast. It was brought into existence more for the purpose of harmonizing the activities of quarantine officials than to have any direct influence on legislation.

The work of quarantine officials is looked upon more favorably than some years ago. Naturally they come in contact with producers who at times have felt that quarantine officials have been antagonistic to their best interests, but a more complete understanding of quarantine and of its power to keep out of the country pests which cost the producers millions has given more correct idea of the value of their work.

ORCHARD FRUITS

The bureau of crop estimates reports serious injury to fruit trees in many portions of the eastern United States. Arkansas: "Apples in central section injured by freeze." Connecticut. "Prospects fair for good apple crop; thousands of trees girdled by mice." Florida: "Heavy crop of citrus." Georgia: "Pear crop damaged by cold and blight; first crop of figs damaged by cold." Idaho: "Outlook for apples favorable; wet, windy weather hinders spraying." Indiana: "Little damage reported; fruit trees in bloom." Maryland: "Freezing weather injured fruit buds." Missouri: "Peach trees in bloom." New Jersey: "Trees wintered well." New Mexico: "All fruits except a few apples and pears killed by blizzards." North Carolina: "Peaches damaged." Ohio: "Cherries, peaches, pears damaged by freezing weather.' Oregon: "Early fruits full bloom." Pennsylvania: "Little damage shown." Tennessee: "Peaches damaged 50 per cent by frost." Virginia: "Fine peach crop; apples in bloom."

STANDARDIZATION

Horticultural Commissioner Ryan of Los Angeles County is putting on the fruit stands boxes and crates of berries and small fruits as good bottom as top. He is not growing berries, but the Japanese are and have been in the habit of showing some remarkably fine surface layer fruit. Some of Mr. Ryan's inspectors have been inconsiderate enough to look below. Stiff fines have resulted, and one may now be almost reasonably sure of a good ripe, plump berry on the lower layer as well as the top. Here are two short paragraphs from an extended report of the situation:

"A case brought against a Japanese potato grower and a Chinese dealer on April 14 in Judge Frederickson's court for selling and offering for sale a deceptive pack of potatoes resulted in the assessment of a $25 fine against the dealer and $50 against the grower.

"In the early morning hours of April 13 a visit to the Ninth Street wholesale market (Los Angeles) for the purpose of securing evidence netted 11 berry growers who had prepared deceptive packs. One complaint was issued against a grower who sold potatoes in lug boxes prepared in such a way that the big ones hid the little ones. These cases were heard in Judge Frederickson's court. He fined each of the 12 defendants $35. after he had ascertained that they had been informed of treatment accorded violations the week preceding, with the remark that next week it would be $50."

CALIFORNIA RESOURCES

The California Development Board is publishing reports of its 29th and 30th years of existence and in addition giving a fund of information as to California resources and possibilities. The board could not wait for complete returns from the 1920 census, but estimates the state's population at 3,537,217. The estimates made by the board give the state a population increase in the past ten years of 47.79 per cent. The county having greatest percentage of increase in population is Imperial with 219.82. Counties showing an increase greater than 50 per cent are: Fresno, Kern, Kings, Lassen, Los Angeles, Merced, Orange, San Diego, San Joaquin, Stanislaus, Tulare.

Of greater interest, however, than the population increase is a series of tables having to do with commerce and production, especially that portion of the book having to do with farm products, and that is by far the greater portion of the book. For instance, alfalfa is the king of field crops in California. The 972,162 acres of alfalfa produces about 5,000,000 tons of hay. Alfalfa is grown in every county in the state, Tulare County leading with 102,300 acres, Imperial has 96,140, Merced 92,000, Kern 90,000, Fresno 68,480. Imperial County was formerly leader in alfalfa production, but cotton has crowded out much of the alfalfa.

The greatest increase is shown in California's fruit crops, but when we begin to talk of California fruit production a long story is before us, so only one instance is taken: "During 1919 California fruit growers produced fruit valued at $234,613,000, which is but $6,000,000 behind the valuation of field crops.

TO ESTABLISH OPEN MARKET FOR WHEAT

Plans for a national conference to discuss methods of reestablishing a free and open market for wheat, through the grain exchanges of the country, upon the approaching termination of the authority of the United States Grain Corporation on June 1, were outlined recently in a letter sent out by Julius H. Barnes, United States wheat director.

Representatives of wheat and flour trade organizations and newspapers are meeting this week in Chicago to confer with Mr. Barnes on suitable measures to be taken to "provide for and to permit establishment of a free and open market for the purchase, sale and handling of wheat and wheat products," upon the expiration of the wheat guarantee act.

"Problems of great national importance make such a meeting imperative in the public interest at the earliest possible moment," Mr. Barnes declares. One is the present level of wheat prices kept far above that of the United States guaranteed price by export buying of wheat only, which, in addition to being artificial and liable to stop at any moment, handicaps our own mills and results in underproduction of mill feed for our dairy industries. Another is the apparent reluctance of the exchanges to return to the prewar conditions of open trading and reestablish the hedging facilities which have been suspended during three years of government wheat control. This attitude of the exchanges is due largely to the extraordinary trade hazards resulting from world disorganization. Exchange hedging facilities, upon which wheat marketing depended for years prior to the war, must be restored by individual initiative before the underlying security provided by the grain corporation is withdrawn, otherwise the country faces the risk of wider margins between the producer price and the consumer price, and consequent hardship to the consumer. Foreign buying of wheat, largely concentrated in the hands of governments at the present time, is forced by bread subsidies abroad and by the inability of their war crippled private agencies to "carry at high values sufficient stock and sufficient flow for assurance of the bread requirements of their people. The decision of purchase and prices paid rests in a few officials and it is measurably true that these officials, with or without concerted action, can influence the price level for America."

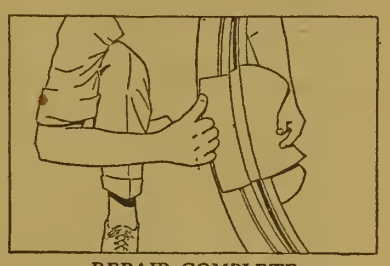
Greater Tire Mileage—and the Goodyear Service Plan

Copyright 1920, by The Goodyear Tire & Rubber Co.

FABRIC BREAK

A fabric break may be repaired on the road by using the Rim-Cut Patch without cement. It should be vulcanized later. If the tire is too old to be worth vulcanizing, a satisfactory repair can be made by using the Rim-Cut Patch and CEMENTING IT IN with Goodyear C-35 Patching Cement. To do this follow these directions: First be sure that the fabric at the break is dry; then clean the inside of the tire at the break with gasoline; after it is dry apply two coats of C-35 Patching Cement, allowing each to dry. Give the outside of the patch the same treatment; insert the patch by seating the toe of the tire bead in the crease in the patch wing. Now work the patch down all the way across the tire, pressing it down firmly and smoothly, and then adjust the other wing of the patch around the other bead. For cord tires, the Goodyear Cord Patch is the ideal tire saver to use.

RIM-CUT PATCH BEING INSERTED



REPAIR COMPLETE

EVERY Goodyear Tire Saver, like the Rim-Cut Patch illustrated, is designed to insure that greater mileage which is the purpose of the Goodyear Service Plan.

To the fine quality of Goodyear Tires and the convenience of their distribution, this plan adds effective means of prolonging the usefulness of injured tires.

In the case of a fabric break, for example, it provides in the Goodyear Rim-Cut Patch a dependable emergency repair which protects the tire until a permanent repair can be made.

But in addition to tire savers, the Goodyear Service Plan provides also tire conservation lessons, instructive advertising and the helpful advice of Goodyear Service Station Dealers everywhere.

Take full advantage then of the Goodyear Service Plan. Ask your Goodyear Service Station Dealer for the Conservation Bulletins; use his advice; keep Goodyear Tire Savers in your car—these are the means to greater tire mileage.

Citrus Pruning Schools

By Ernest Braunton

IT must not he taken for granted that all citrus owners are citrus growers, even if they live in the orchard and do their own work. So many graduate from the office or salesroom that citrus culture is Greek to them. They sometimes own an orange or lemon grove almost before they are well able to tell these two varieties apart when no fruit is present.

To aid these inexperienced orchardists the several county farm bureaus have pruning schools which are conducted on each of several farms for a period of half an hour or thereabouts, but one or two young trees being pruned in each orchard. Usually all the owners of citrus trees in a neighborhood will gather and watch and listen to the instructor until he has visited the orchard of each. So that in a day, or even in a half day, they gain a considerable knowledge of the principles of the professional pruner.

Instructor and Class.

Such a school was attended hy the writer on April 23 in the Hansen Heights and Orange Cove districts, both branch valleys from the great San Fernando. Pruning was done on trees in the orchards of C. S. Berryman, A. Cheney, S. Fontaine, C. L. Kingsley, C. H. Landenherg and A. P. Smyth. Trees at each of these places had been selected that were close to the highway and much in need of judicious pruning, and the owners had been notified to have a lot of rapid fire ouestions on tap. The instructor was Vincent F. Blanchard, assistant farm adviser of Los Angeles county, some of whose instructions follow herewith:

It is important that pruning be begun early; the nurseryman who grew them should start aright, though he does not always do so. The gravest fault of the average nursery tree is that all the branches diverge from one point in height, on the trunk, forming what the botanist calls an umbel, or as the braces start from an umbrella handle. These young branches which are to form the head or framework of the tree should be three or four in number, not more, and diverge from the trunk at distances of six inches from each other. If the orchardist does not receive his trees so started he should train new growth in such way as to induce proper heading.

"As the twig is bent so the tree is inclined," must not be lost sight of. If the head was started right leave the young trees alone until needing shaping or thinning, or both. One little tree but three feet high was found that had ten branches where it should have had only three. But owing to the position of these seven could not well he cut away and leave a good framework, so four or five were left. Another reason for not cutting away all the surplus at once is the denudation of foliage. Leaves are the lungs of a tree and the plant food factory and every leaf you take away, if there be space for all, stultifies to a slight degree the natural functions and consequent manufacture of food. A heavy crop of leaves is necessary to the health of all plant life, unless it he parasitic.

Thin, Don't Head.

Thin the tops to allow sun and air to get in so that all foliage left may function properly, taking out undesirable wood. This may he suckerwood, crossing branches, or those so hanging over the center as to exclude light. Do not head back, that is, cut off at any point a young branch merely to shorten it, for chopping off a stub but induces more suckers at this point or an undesirable mistletoe-like mass of small and weakly twigs. When a shortening is made, cut the leader off just above a good lateral branch that then becomes a new leader. Don't forget the meaning of the word "leader" and lead in the right direction.

Do not head back in a young tree to make nature fill a gap in the frame more quickly; she will do it in time and in a better way. But begin early to train and do not delay until long shoots hearing fruit have to be cut out. This commonly occurs in lemon trees and Valencias. Weakly growths may also be thinned so they will develop and form their proper proportion of the top, and some of these must be left to huild on, even though small and weakly at first. Too dense growth in young heads will finally cause the death of nearly all leaves so nothing is left; therefore thin judiciously; but do not overprune.

The danger from sucker growth is that it fills the tree top with non-fruiting wood and takes the strength that should he diverted into the fruiting framework every good tree should have. Avoid strong, heavy upright growths in the center.

It has also been noted that trees of sucker growth suffer far more damage during heavy windstorms than trees of more sluggish growth. As the trees become old the short, lower branches may become wiry and nearly leafless, shaded out by the stronger secondary branches above. The former should he cut off except they bear fruit. Valencias are sometimes left until sucker wood comes into bearing and forms too much of the tree to be cut away with profit, hence the value of early and continuous training. In navels such wood does not bear well and should he taken out for the type of wood constantly changes and must be closely watched. The Valencia remains true to type in comparison. Ill shapen and poor types of lemon trees not possihle to reclaim through use of the shears or saw should he topworked (hudded) to gain a good framework.

Claremont Pomological Club

By V. V. Le Roy

The regular monthly meeting of the Claremont Pomological Club was held at the Chaffey high school, Ontario, on Saturday, April 34. Prof. Chas. J. Booth and wife were the hosts of the day.

The first speaker on the program was Prof. R. S. Vaile of the state citrus station at Riverside. From his large observation of practical ranchers and data from many scientific experiments he talked mostly about the water in our soils. Many tests in other states have lately shown that the dry dust which we have kept in our orchards to conserve moisture helps in this particular but little, if any. The real value of our cultivating is to keep the weeds out and keep the soil in condition for deep furrowing for irrigation.

Weeds rob the soil of great quantities of moisture. Summer cover crops should not be grown unless one has plenty of water and can give the trees frequent irrigations. Dry soil takes up moisture very little, while if furrows are down to the moist earth the water soaks in rapidly Take a dry sponge and put it in a bowl of water and it will stay dry for a long time. Wet it and wring all the water possihle out of it, and then put it in the bowl and all of the water will soon be in the sponge. Soil acts the same way. So keep soil always wet. Cultivating also keeps the fine fihrous roots down where the hot sun will not burn them.

The temperature three inches below the surface of the soil is five degrees hotter than it is in the sun. Practically no phosphoric acid or potash applied in the usual way in fertilizing gets to the feeding roots. Hence we do not know yet from crop results or the experiments carried on so long at Riverside whether these two elements are of much value or not, because they have not been applied down in the root area. In his observations he does not know that deep plowing or late plowing, where roots are cut off, is a factor in the June crop. He has

known of many orchards that have been plowed late in April that have set a full crop, just as full as a neighbor's who plowed early. He is inclined to believe that low moisture condition is much more accountable for excessive dropping.

About eighty took dinner with the hosts in the domestic science dining room. After lunch Dr. Hill, head of the high school, spoke a few words of welcome and commendation of the club and its work.

Elbert S. Lewis of Uplands, in the auditorium of the school, gave an illustrated talk on "Lemon Root." He showed that the bad conditioned and non-productive trees in lemon orchards are so because the buds of lemon above the union with the root stock have grown into the soil and, taking root, sapped the vitality of the trees, causing it to stop bearing. Much of this is caused by allowing the soil to get above the bud union. Hundreds of sick, unprofitable trees have been restored to vigor by removing the soil below the bud union and sawing off the lemon root.

E. L. Durham, C. E. Needham and G. G. Laidlaw all gave many instances where this has been done in the last two or three years under Mr. Lewis' direction.

Dr. H. J. Webber was the special speaker of the day, this being his last appearance before he leaves for South Carolina, where he has been engaged by the Pedigreed Seed Co. He spoke of his sorrow at leaving California. "Seven years seems to be the allotted period of my work in different states. I have been here now seven years. I was in Florida seven years, in New York seven years, and have been stationed at times in many other states. In all the other states they have special products, but California can grow them all or nearly all, as well as any of them, and many that most of them cannot produce." He spoke of many of the problems we have, such as alkali; the pests and diseases which have to be controlled. Just now the problem we should set ourselves to solve is the nematode menace, the little worm that is doing so much harm and for the effective control of which there is yet nothing known.

The next meeting will be with Wm. Pierson of La Nerne.

GROW WOOD

By Leonard Coates

Your remarks in issue of April 24, advising any who has the space, or a property line, to plant trees for wood, are extremely pertinent. It is this foresight, even in apparently small things, that means so much. Everyone is aware of the high cost of all commodities, and that of fuel is certainly not the least important. However much some may wish to think to the contrary, the cool fogs of the coast and the frosty nights of the interior turn one's thoughts and desires to an open fireplace.

As pointed out in another article in same issue, American farmers need to heed more carefully the methods practiced by many European peoples in providing wood for fuel. I have before alluded to the custom in France, Belgium and England, observed while on a tour of those countries, of systematic and intelligent decapitating, "pollarding," or sometimes merely thinning out branches, instead of ruthlessly chopping down a tree, leaving, in most cases the stumps to rot. Trees, properly cut, would produce an increasing supply of wood almost indefinitely. For this purpose they should be cut during the winter and spring, the branches sawn off smooth, close to trunk, or in a sloping form.

Naturally, the eucalyptus family lends itself most opportunely in California for wood, although if a deciduous tree is preferred the catalpa, locust, black walnut and others could be used.

Correlative to this important subject, it is also a fact that the same principle may be applied in the renovation or recuperation of fruit trees. Unless from disease, the roots of fruit trees do not die in man's ordinary lifetime and frequently would prove an inheritance to his children and children's children. It is abuse and neglect that cause the trees to weaken, and the grubbing hoe and dynamite finish the job. All quite needless. Prolong the healthy life of your fruit trees by more careful pruning, and if,

Case Threshers Save Your Crop

GOOD threshing is the climax of good farming. It's what you have been working for ever since you began preparing ground for seeding. It's just as important as fertile soil, summer showers and harvest sunshine,—and it's up to you. If you do not own a Case Thresher, the next best thing is to employ one.

The Case Steel Built Thresher, in any of the six sizes we manufacture, is the machine of *clean threshing, thorough separation, perfect cleaning* and *unequalled saving.*

You owe it to yourself to save all you harvest. You can do it with a Case Machine. It successfully handles Rice, Flax, Peanuts, Peas and Beans, Rye, Oats, Barley, Wheat, Clover and Alfalfa, Millet, Buckwheat, Timothy, Orchard Grass, Kaffir Corn, Sorghum, Broom Grass Speltz, Hungarian Grass, Red Top, Blue Grass, Milo Maize, Sudan Grass and Feterita.

After passing the cylinder, where all the grain is threshed and most of it separated, the straw is shaken,—shaken—shaken;—230 shakes a minute. Note the improved straw-rack, the great separating surface and ample space for straw.

Write for catalog of Case Steel Built Threshers showing sizes suitable for the individual farm or for custom threshing on the largest scale.

NOTE: We want the public to know that our plows and harrows are NOT the Case plows and harrows made by the J. I. Case Plow Works Co.

Pride in "CATERPILLAR" TRACTOR Achievement

WHY is it that so large a percentage of "Caterpillar" Tractor owners operate their own machines? It is not alone because this tractor is so easily handled, nor because its performance is so dependable and consistent that it requires a minimum of attention. The chief reason is found in the fact that the owner gets a special satisfaction from the operation of this tractor—feels a particular pride in its achievements.

The "Caterpillar" Tractor owner feels complete confidence in the ability of his machine to handle any and every power task. He knows that whatever work may be required of it—tractive or stationary—it will do the job quickly, efficiently, economically.

"Caterpillar" Tractor superiority was recognized by thousands of farmers even before it was officially established by the exclusive adoption of this tractor for the hardest war service of England, France and America.

after bearing many crops, they show signs of weakening, carefully remove the top, giving the cut surfaces a covering of asphaltum. The root is strong and intact; in two or three years a new orchard, producing the finest fruit, is the natural result.

If the recently formed deciduous fruit experiment station would take some old orchard and make such a demonstration, it would be of great value. The farmer wants demonstration by the experts; he does not want to pay for more "experimentation."

CROP REPORT

Continuing the crop reports begun in issue of April 24:

A. Everett, Moorpark, Ventura County

Regarding deciduous fruit crops in Ventura County, I am not prepared to say anything definite excepting on apricots, but think the outlook is fairly good for other varieties. There is generally a poor prospect for apricots, especially where they had a heavy crop last year and could not be irrigated. With irrigation in many places there is a very poor showing. Climatic conditions have caused three or four blooming spells on our apricot trees. The heavy 'cot crops are from the first and second settings. Even now there is bloom on many of the trees, and some of them have more bloom than at any previous time this year. I am still in doubt whether fruit will set on so late blooming. The leaf growth is very backward, which is favorable.

On 100 acres of my old orchard there will be a second crop and on another old orchard of mine, irrigated at a different time, there is a very poor showing. For the county less than one-half crop is my estimate at this time.

J. N. Ballantyne, Lodi, San Joaquin County

Almonds, 75 per cent; apples, none in district; apricots, 75 per cent; cherries, 80 per cent; peaches, 95 per cent; pears, 75 per cent, prunes, 80 per cent.

N. E. Mathews, Santa Ana, Orange County

There have been so many apricot orchards dug out in Orange County that it takes some scouting around to find them now, but a careful estimate from some of the growers gives from 50 to 60 per cent of a crop for the county, possibly owing to a peculiar condition existing this year in the fact that the apricots, like some of the other fruits, show some good sized early cots and some quite small late ones.

Sonoma Forecast Favorable

County Horticultural Commissioner O. E. Bremner, after an extensive survey of conditions in his county, is quoted as saying that "the prune orchards have blossomed wonderfully—the best in years. Even four year old trees are full of blossoms, and it looks like a most prosperous year for the county."

CROSS FERTILIZATION IN PEARS

In Eastern states not only the Bartlett, but several other varieties of pears are nearly self sterile. The Keiffer is notorious in this respect. In California less trouble is experienced than in other states, but even here self sterility is occasionally quite marked. It is well, therefore, to interplant varieties which it is known will cross, thus minimizing the risk of crop failure. In many sections of California the White Doyenne is planted with the Bartlett, though the latter is never here so self sterile as it often is on the Atlantic Coast. Quite frequently self sterility is due to overblooming and then another variety in bloom at the same time insures a crop, for in this weakened condition of the floral organs they readily accept pollen from another variety.

DRYING PERSIMMONS

The acreage of persimmons in California is doubtless growing as fast as that of any other orchard tree and all who grow persimmons are interested in preserving the fruits so they may be used throughout the year. The methods of drying vary somewhat in practice, and herewith is given one that has brought splendid results in Australia:

The fruit was taken from the trees while still quite firm, with portion of strig attached. It was then peeled, leaving the strig and a small surrounding piece of peel intact. It was suspended by string attached to strigs, and placed in the sun until dried so that no moisture would exude upon pressure between the fingers. The fruit was then placed upon trays and dusted with sugar on the other side. The drying process was then continued for a time, but not until it became hard and leathery. It was then packed in shallow boxes, and has kept splendidly. It is necessary that each fruit hang quite free whilst drying, for if placed upon trays in the first instance that part which comes into contact with the tray remains moist.

PINK BOLLWORM AGAIN

Advices received by the state department of agriculture from Washington confirm the reports from Louisiana that the pink bollworm has invaded two parishes in that state, as well as having appreciably extended its range of infestation in Texas. This produces a serious situation for the cotton industry in the United States and unless drastic measures are adopted, and that without delay, the dreaded pest will be beyond control and the value of the important extermination work in Texas will be reduced to nothing.

California has succeeded, so far, in excluding the two prime cotton pests, the boll weevil and the pink bollworm, but only through heroic measures, and never a month passes but that the California department inspection service does not hold up shipments of cotton seed and other commodities from weevil and bollworm infested states, which could harbor and distribute these two dreaded pests, and spell ruin for our cotton industry.

Make Your Valuable Orange Crop Safe From June Drop and Fungus

Are you sure there is no Black or Citricola Scale in your grove, sapping the very life out of the trees that are setting what will be a burdensome crop?

Investigate for your own good. One Black Scale will produce 2000 to 3000 more, quickly spreading to healthy trees. Left alone it retards the growth of the tree and injures the fruit, sometimes lowering the grade considerably.

You can thoroughly clean your trees and eliminate Black and Citricola Scale, Red Spider and Fungus, if you will apply

TIZIT SPRAY

There is a grove near you where TIZIT has done all we claim for it. Send for the name and address of the nearest TIZIT SPRAY user so you can see the results.

The sooner you put TIZIT on, the more work it will do. The genuine TIZIT is labeled TIZIT—Trade Mark Registered.

Folder sent on postcard request.

BOUR-DAVIS

· MOTOR CARS ·

A Big Car in Size and Power—A Small Car in Weight and Expense

The Bour-Davis is the most sensible car you can buy particularly if you reside in the southern or western states.

We who live in these sections know that we have motoring conditions to face that require a wider margin of power and strength than most motor car builders have seemed to think necessary for average service.

The Bour-Davis is designed to meet just such extra severe service conditions as we face in these sections. Its power is wonderful—greatly in excess of the average car of its weight.

It is an all-the year-'round, all-road car.

You will marvel at its comfort. The springs are specially designed to ease the car over the roughest roads, yet with extra strength to guard against breakage.

Every part has been designed with the same idea in mind to provide for excess strains.

Yet with all this reserve strength, the Bour-Davis is far lighter than many cars less capable.

Strength has been secured by the use of costly steels and materials instead of by great masses of metal. Another source of lasting delight in the Bour-Davis is the beauty of the car. It is a car that everyone admires and envies—yet so artistically correct in lines and proportioning that it never grows tiresome. In furnishings and in fittings, the Bour-Davis has rarely been equalled by any car at any price.

Imagine a medium-priced car with such unusual features as a lined top, real leather upholstery, and a choice of four leathers to suit your individual tastes —three options on body colors; tonneau lamp; inspection lamp with cord wound on an automatic spool; thermos bottle compartment, and a variety of other features never before found on any car at anywhere near the price.

We promise you that the Bour-Davis will be the most satisfactory car you can buy. But don't take our word for it. See the Bour-Davis. Ride in it and drive it, and let it prove itself.

Our latest six color catalog will be sent on request

TO DEALERS
You will find the Bour-Davis an exceptionally profitable selling proposition. Some territory still open. Write for full information.

New Standardization Law

The new standardization law which is now affecting the marketing of crops for the first time covers 17 products in fruits, nuts and vegetables, as follows: Almonds, apricots, berries, cantaloupes, cherries, grapes, onions, peaches, pears, plums, potatoes, prunes, quinces, sweet potatoes, tomatoes, walnuts and oranges. In addition to the information sent out by the state director of agriculture, the county horticultural commissioners have been sending out charts which show in reduced form the general requirements of the law, 12 in number.

In two of these the full list of 17 must qualify, that is, all shall be virtually free from insect pests, fungus diseases and all other serious defects, and all but the oranges must be uniform in quality and free from pests. A group including apricots, berries, cantaloupes, cherries, grapes, peaches, pears, plums, prunes, quinces and tomatoes must also be mature, but not overripe, well colored for variety and location, and free from bruises. Those to be free from frost damage are apricots, berries, cherries, grapes, peaches, pears, plums, prunes, quinces and oranges. The same list, except the orange, must be free from sunburn, and to the list is added cantaloupes, potatoes, tomatoes and walnuts.

Uniformity in size must be observed in apricots, berries, cantaloupes, cherries, peaches, pears, plums, prunes, quinces and tomatoes. Approximately the same numerical count must be in each layer of packed straight-side container of apricots, plums, prunes and oranges. In apricots, plums and prunes no layer below the top in a sloping side container shall contain a greater number than in the top layer. The sugar content of grapes, except Emperor, Gros Coleman and Cornichon must be 17 per cent, according to the Balling scale, and the three noted must have not less than 16 per cent of sugar. In oranges the sugar content or soluble solids must be eight parts to one part of acid and 25 per cent must be orange or yellow in color before picking. If the test is less than eight to one, 75 per cent must be colored before picking.

The containers must have in plain sight and in plain letters name of grower and address, or packer's name and address; variety of fruit if known, or words "unknown variety," or words "mixed variety" if more than one, minimum net weight or number of fruits within four, except pears and peaches, which must have correct number within four. It is a misdemeanor to prepare, sell or offer for sale a deceptive pack of fruits or vegetables, either fresh or dried. Anyone in doubt as to the requirements of this law may get the chart noted from his county horticultural commission or the state department of agriculture at Sacramento.—E. B.

Sharing Prosperity

The John S. Armstrong Nurseries at Ontario have had a most satisfactory growth for many years. In fact, Mr. Armstrong located in Ontario in 1889 and has been in the nursery business there since that time. There has been a continuous growth and the nurseries have become a great factor in the upbuilding of the community and in the prosperity of the state. The most successful of all these years has been 1919, and Mr. Armstrong has felt that the prosperity that has been given should be shared in by those in large measure responsible for the prosperity. Hence the following letter from Mr. Armstrong to each one of the half hundred employes:

"In accordance with my custom, a cash bonus, or what may be properly called a share of profits, will be distributed to all employes of the Armstrong Nurseries at the close of the fiscal year, May 31.

"As our shipping season is drawing to a close, it is possible from the balance sheet of March 31 to be fairly accurate in computing the profits of the year; hence am pleased to make this announcement at this time.

"This has been an unusual year and therefore the division of profits will be increased over previous years. This being true, I feel that some recognition for length of employment should be given, and that those who have been with me for a number of years should be given a little larger share. Hence the following plan for this year has been decided on, which I trust will meet with the approval of every employe:

"Continuous employment, ten years or more, 25 per cent of the year's salary.

"Continuous employment, five to ten years, 22 per cent of the year's salary.

"Continuous employment, two to five years, 20 per cent of the year's salary.

"Continuous employment, one to two years, 15 per cent of the year's salary.

"Employment under one year, ten per cent of salary received.

"It is only fair to mention the future. It is my purpose to continue the distribution of profits from year to year, but such profits must come from the year's business in which they are earned, and therefore I cannot promise that the future years will be as large as this one or that there will not be years when there will be no profits, as has occurred in the past. However, the outlook at this time is promising and, without any promises, I can only expect that the business will continue to prosper.

"The business is now far beyond a one man job. It will thrive and prosper just as each one connected with it feels his responsibility to do his part, and I want to say that the future may be judged by the past. Your cooperation and loyalty will continue to be a strong force to promote success. I only wish each one of you had an opportunity to hear and read the expressions of confidence so freely given by our customers at our salesyard and in correspondence. This is the result of your good work in your department, for it is necessary that each department hold up the Armstrong standard to bring such results.

"This personal expression I wish to add: It gives me far more pleasure to make this announcement than it will give you to receive it, and I hope you will accept my sincere appreciation for work well done."

TRACTOR COURSE AT UNIVERSITY

The tractor short course to be held at the university farm, Davis, from June 1 to June 11, is planned for the man who wants to learn the principles of the gas engine and tractor, the operation and repair of tractors, and the latest in tractor construction.

The lecture demonstration subjects are gas engine construction, gas engine principles and types, fuels, carburetion, carburetors, ignition, battery and magneto, governors, cooling system, lubrication, transmission, clutches, tractor management, plows and hitches. Charts, models and tractor parts will be extensively used in the lectures.

Practice work will include magneto timing, ignition, trouble finding, carburetor adjustment, valve timing, babbitting and scraping bearings, soldering, forging practice, motor repairing, instruction and operation of the fifteen or more tractors which will be used in connection with the course.

Registration is limited to 180 students, who must be over 18 years of age.

GASSING SQUIRRELS

I fill a continuous sprayer with gasoline or distillate, go to the squirrel holes and give a few strokes, throwing the gas ay back into the burrows, then fill the opening with earth and the job is done. I have never had one dig out. I like this better in the fields than poison, as there is no danger of stock or poultry getting poisoned. It is much faster if two work at it, one with the sprayer and the other with the shovel; then there is no laying down of tools. Yours for progressive farming, S. C. Hill, Gorman.

THE WONDERFUL PALM FAMILY

By Ernest Braunton

THE cocos family, to which group the coconut of commerce belongs, is native to the Americas alone, but the buoyant husks of these nuts enable them to cross oceans without impairing their germinating power. Thus edible coconuts have been stranded on the coast of Norway, whence no man knoweth. This has enabled the coconut to become naturalized in a tropical belt around the earth. In Southern Florida is found its only anchorage in the United States. On the island of Ceylon there is a belt of these palms 120 miles long, said to contain 11,000,009 plants.

One group of palms, to which the coconut belongs, is called social because growing in forests or thickets, and in the later class no country can surpass the United States. In the swampy tangles of lower Louisiana and Florida the Sabals, Adansonii and serrulata and Rhapidophyllum hystrix form impenetable thickets of great extent. In Algiers the hardy Chamaerops humilis, a common dwarf fan palm, holds possession of vast tracts of land to the exclusion of all other plant life. In the marshy parts of the Philippines there are broad expanses covered with Nipa palms, N. frutescens, the most common species there.

Though generally of single stem, some palms branch, and freaks have been known to occur in all species. The two species most common in Los Angeles — Phoenix Canariensis and Washingtonia filifera—have both been observed by the writer to have a single branch or side head of lesser dimensions than the main top or crown. But the doum palm of Egypt, Hyphaene thebaica, always branches into two or more heads and in the desert region there, between the Rivers Dande and Zanza, there is a vast forest of them. In length of stem the rattan palms of the Malayan Peninsula have rope like stems, hundreds and occasionally a thousand feet long, forming tangled masses in the tops of forest trees. One has been reported at 1,700 feet.

A few palms have huge gourd like swellings in the middle of their stems. This is often seen in Chili in the coquite, Jubaea spectabilis, the hardiest palm grown in California. But in Central Africa the Delib palm, Borassus arthiopum, a very tall species, has a swelling that is characteristic of the species; not an abrupt bulge, but gently tapering at both ends into the main shaft. This is said to give the trunk the strength necessary to sway with the fierce gales that lash them about like so many stalks of grass. The Peruvian wax palm, Ceroxylon andicola, has a heavy coating of wax on the stem, which gives it the appearance of a marble shaft. A single palm will furnish 25 pounds, which is scraped off, mixed with tallow and made into candles. Another palm from Brazil furnishes wax used in making phonograph records.

The giant Iriartea exorrhiza of Panama and adjacent territory has stilted roots which so raise the trunk above the ground that a man may stand under this grated or barred canopy with the tall palms above his head. The trunk of the peach palm, Guilielma speciosa, of Venezulea, is so hard and flint like that it will turn the edge of the best ax. The size of palm seeds range from half as large as the average garden pea to the fruit of Lodoicea maldivica, the double coconut, which weighs 40 pounds. The flowers of the average palm are not specially atractive, but the centralized flower spike of the talipot palm, Corypha umbraculifera, is sometimes 30 feet high above the leaves and is estimated to bear 60,000.000 flowers. It flowers but once, and dies. The leaves of this palm are so large that ten or a dozen persons may conveniently stand under a single leaf, and Raphia taedigera, a feather leaved palm of Brazil, has beautiful leaves 60 feet long. The total number of species of palms is about 1,200, of which California proper has one, Lower California, a half dozen, and the southeastern United States about the same number.

The division of forestry of Hawaii is selling to planters forest and ornamental tree seedlings at $1 per thousand. The favorite is the Australian red cedar.

THE TEMPLE ORANGE

Florida growers are making strong claims for the new Temple orange, stating it to be superior to anything yet grown in that state. Circular sent out by the distributor says:

Orders from California have been refused. Necessarily; for all the wealth of the distributor could not gain entrance to a single Floridan tree under present quarantine regulations.

The Description

"It has been by reason of the good looks of California oranges that they became so widely distributed." "Its origin is a mystery. When first discovered the parent tree was producing fruit of a most distinctive character. The skin is semi-loose, not as much as in the tangerines, but enough to make it easily peeled without soiling the hands."

We have so many of the mandarin-tangerine type that we need no more, but if it is a cross between this class and one of the standard varieties it should prove of value. If it is, as claimed, "as good to look at or eat as any California variety," Floridans are to be congratulated.—E. B.

RIVERSIDE CITRUS CENTER

The citrus growers gathered to the number of over 100 the other night and organized the Riverside Citrus Center. H. A. Lynn was elected director and an executive committee, consisting of A. L. Woodill, J. L. Bishop, H. B. Chase and W. G. Frazier, was appointed. It is anticipated that a real live center will be the result.—E. L. K.

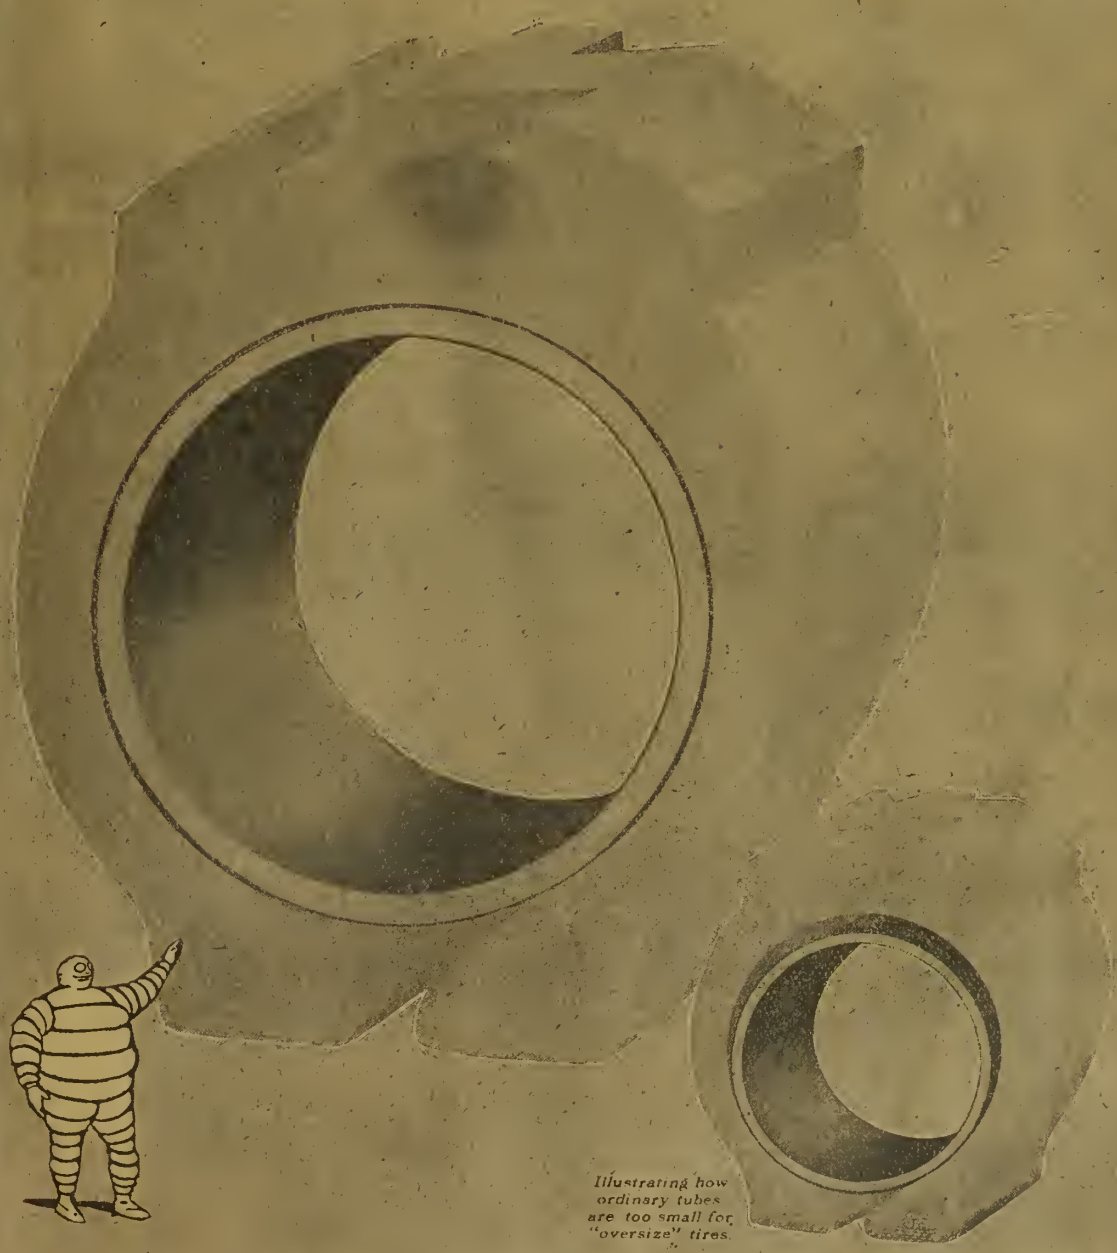
NEW ZEALAND TREE TROUBLE

The government orchard instructor of New Zealand has made public a report on the new disease affecting principally apple and pear trees. It is said to make the trees look as if they had been scorched by fire, all fruiting and laterals, and in many cases strong wood shoots being destroyed by the cankerous results of the infection. The trees badly attacked have lost all the year's fruit. The exact nature or origin of the blight has not been determined, but is being carefully studied in the government laboratories.

Florida reports "unfavorable rains, soil already too wet in most sections, cotton seed rotting, corn and peanuts making slow growth on all lowlands, melons only fair on highlands."

MICHELIN

tubes fit "oversize" casings



Illustrating how ordinary tubes are too small for "oversize" tires.

Michelin Tubes are not only made ring-shaped to fit the casing without wrinkling, but in addition are full size in cross-section, and are therefore not stretched thin when inflated. This is especially important when buying tubes for Cord Tires, which are nearly all "oversize".

Tubes that are not really large enough for normal size casings work under a still greater disadvantage in "oversize" casings. Therefore it is greatly to the motorist's advantage to specify Michelin Ring-Shaped Tubes, the only tubes that both fit and fill the tube space in the casing.

Michelin Tire Company, Milltown, New Jersey

1920

Get the Latest Improvements

Improved Russell features save doubly. Russell Threshers *work faster*—and save both time and labor; they get *all the grain*—and turn what was formerly lost into clear profits.

These exclusive features include the big easy-running 15-Bar Cylinder that works tooth-and-nail with the patented High-Finger Grate and separates most of the grain right there; and the patented Distributing Beater that spreads the straw evenly across the rack and gets the very last grains.

No other thresher has these features—and no other can equal the Russell for *getting out the grain*.

Six Sizes of Threshers
for Grains, Seeds, Rice and Beans

The Russell is the thresher chosen by many thousands of expert threshermen all over the world—you can safely follow their example.

And Russell threshers, like the steam and kerosene tractors, are *built up* to old reliable standards, not *down to* a price.

Get posted on the latest improvements in Threshers—send for the Russell catalog

RHUBARB 90% of the Rhubarb grown in Southern California is Wagner's Improved Giant—Growers making over $1,000 first year. Splendid results in 6 months from planting. May, June and July best months to plant for crop next winter. Get plants true to name from the originator. J. B. Wagner, Pasadena, California.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Little Leaf

What is the matter with my apricots? They are showing practically no growth; leaves exceedingly small and some turned brown. They have plenty of water. Trouble affecting old and young trees alike. In some places only part of the trees affected. —Subscriber, Kerman.

This question was referred to Prof. H. S. Fawcett. He writes: "I do not find any evidence of fungous trouble upon these specimens and they are not of sufficient size nor in such condition that I can make any suggestion from their apearance about the cause of the trouble. To make merely a rough guess I am wondering whether the trees are affected with one of the types of the so-called 'little leaf.'"

Moss on Trees

What makes moss grow on fruit trees? What kind of spray should be used and when?—Subscriber, Healdsburg.

Moss grows on trees when weather conditions favor it, that is in sections of continuous moisture in atmosphere. A one per cent solution of corrosive sublimate. Blue vitriol and sulphuric acid are also effective. Six per cent blue vitriol and two per cent sulphuric acid are the proportions to use with the water. Winter spray of lime-sulphur is also good. Some have used concentrated lye, which may be sprayed or brushed over trunks and larger branches.

Poor Onions

Last fall I planted a lot of onion seeds and the plants were so small I did not set them out until January 12. Very little rain came at that time, alternating with extremes of cold and heat, consequently they did not do well and lots of them are going to seed. Some are sending out side shoots. If I break these off what will happen and when should it be done?—Subscriber, Newman.

Breaking out the side shoots will do no good. The only thing you can do with these onions is to market them at once as green onions. The longer you allow them to stand in the garden the poorer they will be. The seed saved from them is worthless.

Peach Borer

Is there any way to get rid of the peach borer?—Subscriber, Live Oak.

Cut out and kill, or destroy by inserting flexible wire, then clear away soil from around crown of trees and paint up to ten or 12 inches height with whitewash composed of quicklime 30 pounds, tallow four pounds and salt five pounds, thinning with water sufficient to make creamy mixture.

Citron Melon

Please tell me when and how to plant citron melon.—Y. T., Compton.

There is little to tell concerning this hardshelled melon, which for cultural purposes must be classed with the gourds. It seems to be impossible to prevent growth once the seeds are in the soil. Planted even six inches deep in a roadway, the plants will persist in coming to the top. It is best to plant seeds two inches deep in hills several feet apart, as the planter chooses. In California they will make a good crop in any soil without special care.

Deeper Rooting in Clay

We have hard clay soil and the roots of the trees do not go deeply into the ground. How would it do to bore holes, say four or six inches in diameter, three or more feet deep and fill the holes with sand and fertilizer? Clay soil when blasted packs hard again when irrigated. Would it be advantageous to blast the ground after boring and fill the cracks with sand and fertilizer?—Subscriber, Rainier, Oregon.

We do not question that boring and opening up the way to the subsoil would prove beneficial, but at present lahor costs we fear it would prove expensive. It appears to us that frequent use of dynamite, and in this case probably the subsoiler, might open the way for the roots and the water at a more economical cost. Of course the advantage in the hole boring would be in its permanency and the placing of sand or gravel in the soil, which would make a perpetual opportunity for roots to gain lower levels. We do not think the blasting would give opportunity to fill cracks with sand to any great extent.

Bats

Can you please tell me how I can get rid of bats? They are between the walls of the house and make an awful noise at night. We chased them out and nailed the holes shut, but they make new holes again. They'll find their way in somehow and the smell

Actual tests

By exhaustive study and engine tests, our Board of Lubrication Engineers has determined the correct consistency of Zerolene for your make of automobile. Its recommendations are available for you in the Zerolene Correct Lubrication Charts. Get one for your car at your dealer's or our nearest station. ORNAMENTALS

Trees, Plants, Shrubs direct from the nursery to you. Choice stock. Big assortment. WRITE FOR CATALOG, which illustrates and describes best varieties for California conditions.

LEONARD COATES NURSERY CO.

Morganhill California

is terrible.—Subscriber, McFarland.

We are totally at loss as to handling bats and can give no helpful suggestion. The only light our library gives to us in the matter: "The curious winged bats make up the order cheiroptera. They fly only at night and feed exclusively on insects flying at the same time. For this reason they may fairly be said to be amongst the most beneficial of the mammals and their wanton destruction should never be permitted." However, when they destroy the value of a residence they must be controlled if possible, and we ask our subscribers who have had experience to give their method of handling them. If the house is so open that the bats find ready entrance it would probably be of no benefit to attempt control by use of poisonous gases.

Sick Rabbit

I have a sick rabbit which gets damp just above the tail and seems to try to sit on the damp place and seems to be practically paralyzed. Does not eat well. Feed alfalfa hay and mash, some green, mostly milkweed, clean pens every day.—Subscriber, Orange.

Would advise feeding less milkweed. Clean alfalfa hay, rolled barley and assorted green feeds are better than any quantity of one or two kinds. Watch results and if any one green feed is very juicy, feed less of it, as at times in California under irrigation green feeds have too much water and of course are detrimental, especially to stock confined. Stock running out are better as they can select what they desire.

Lime-Sulphur Spray

Please give formula for mixing lime and sulphur for spraying orange trees. —Subscriber, Buena Park.

The simplest method is to secure the commercial concentrated lime-sulphur and mix with water at the rate of one gallon lime-sulphur to 33 gallons water. If, however, home made mixture is preferred see California Cultivator, August 9, 1919, page 136, formula 10.

Cow for Supplying Home Table

Never have offered either milk or butter for sale but occasionally a neighbor calls and buys a small quantity. Am I prohibited from selling this under present state law? — Subscriber, Fillmore.

This question and many others of similar nature have been referred to a practical dairyman and will be answered in a series of short articles later. It may possibly be two or three weeks before these articles will begin, but we know they will be invaluable. A word, however, to this owner of the cow. If she is healthy and in perfectly healthful surroundings we certainly would sell such supplies as we had that neighbors might prefer. However, by application to your county veterinarian you can have a tuberculin test administered without cost.

Morning Glory

How can I control or rather kill out morning glory?—Subscriber, Lodi.

The best method for eradicating morning glory is through cultivation. Chemical methods are expensive and require handling by experts. In cultivation, however, one should use great care and not drag particles of roots to uninfested ground. Let the cultivations be not more than one week apart. A few weeks of this thorough work will completely eradicate the pest if properly done.

Trespassing Stock

My land is not fenced and the horses, cows, hogs, turkeys, etc. from a neighboring ranch continually trespass on my property, destroying crops. I have many times asked owner to keep stock out of my field when it was in crop, but he ignores my request. I have taken his horse out of my grain field and locked him in my barn, also penned up his pig in order to protect my property. What is the law in regard to this?—Subscriber, Manteca.

This is a question which cannot be answered with much satisfaction. So-called fence laws, estray laws and so far as there is any in reference to them—tresspassing livestock are "up in the air" at this moment because of the recent decision of the state supreme court. In fact, the owner of stock which trespasses and damages is responsible for all damage done. This under the common law and not because of any specific enactment. Livestock, grain, fruit men and other producers of the state have this matter under advisement, and committees are now at work hoping to devise a bill which can be recommended to the state legislature, which will be fair to livestock and other producing interests. After the next session of the legislature, January, 1921, it is to be presumed that a more definite answer can be given. As a direct answer to the above would say that the only advice we have is to secure all possible evidence as to the actual damage done by the stock. As to the estrays which have been taken up, the law specifies that they shall be fed but makes an allowance so small that at present prices of feed the holder of the stock would be ruined if he took up any number and kept the same for any length of time.

Peppers and Tomatoes

When and how shall I plant chili peppers and tomatoes?—M. I., Long Beach.

It is now too late to plant peppers, commercial growers doing this work from March 20 to April 10. Full planting directions were given on page 471 in the Cultivator of March 20.

This is the season for planting tomatoes for fall crop for shipping and canning and we may continue planting seeds to July. While a hot bed is best at all times, tomato seeds planted now will germinate without artificial heat. Sow seeds in warm place in light soil, covering not more than a quarter inch deep. When plants are three to four inches high, transplant to field in rows four to six feet apart, according to variety, and plants three to six feet in the rows. The best varieties for present planting are Stone and San Jose Canner. These two are about in equal demand at the canneries. There is no need of rushing the planting of tomatoes.

NATIONAL TRACTOR AND IMPLEMENT SHOW IN CALIFORNIA

California tractor and implement people are highly gratified at the probability that a great tractor and implement show will be held on the Pacific Coast some time this year, presumably in the latter part of September. Final action has not yet been taken by the national association, but it is hoped by the local people that one of the five national shows staged by the association will be held in Los Angeles. San Francisco has fraternally yielded her claims to Los Angeles and will join in supporting a national show there. The exact location in Los Angeles is not yet decided, but it will be a great outdoor event, though a still exhibit. The local committee is hoping that it can be brought off early enough that good weather can be absolutely assured. It is thought that a manager will be chosen by the national association. Local committees are already at work, though waiting for final decision of the national committee.

Ask the Man Who Uses It

whether or not Nitrate of Soda makes good. Why speculate with "Non-Nitrated" forms of Nitrogen, when, by using Nitrate of Soda, you can insure your crops against adverse conditions?

With the rational use of Acid or Super Phosphate—always recommended by us—there will be no disturbance of normal soil conditions, either in one year or in one hundred years.

California Tomatoes

By Ernest Braunton

DURING the great world war, when every section of our country was called upon to do its uttermost in food production, it was discovered that California is the natural home of the tomato. Owing to the mildness and equability of the climate we may produce two crops, or really a continuous crop throughout the year, whereas less favored states can produce but one, and that in midsummer.

Now that the clouds of war have rolled away the other states are eagerly watching California to learn if we still are going to supply the nation's needs in tomatoes. Owing to dryness of climate we can grow a crop when in any other spot in the United States it would rot from dampness or freezing. The tonnage, too, is sometimes enormous here, and always sure, whereas, from various causes, the crop in other parts is sometimes a complete failure. Though we have occasional light crops, a failure has never been known.

Soil and Climate

Just where tomatoes may not be grown is hard to say, or what the limitations of soil. We have reports from Escondido and Elsinore in the south to Stockton and Oakland in the north, and successes are reported in all soils. As a rule a light sandy or gravelly soil is generally favored. But at Escondido a good crop was obtained in white river bottom sand, and near El Monte in a peaty soil that had the appearance of dark brown corn meal, they still yielded well. In the former no irrigation was necessary and in the latter it could not be given, for the strong soil, with irrigation, produces too much plant.

In northern sections both silt and peat lands in delta sections and heavy black soils are used, though the latter are best as they merge into sand or gravel. Climatically all of California, except the belt of heavy fogs or heavy rains, the tomato claims for its commercial field. Aside from the districts named advices have come from Modesto, Tulare, San Fernando, San Gabriel and many intermediate points. The outlook is for an enormous acreage. The failures as regards financial returns can be traced in nearly all cases to attempting too much. The crop comes all at once and must be quickly harvested or it is lost. Enough help cannot be obtained on sudden call and the crop rots on the vines. Twenty acres is a good field; 80 acres invites disaster.

Time to Plant

A leading seedsman who supplies growers with 2,000,000 plants annually says that the first of August is the best time for planting or the fruits will mature too early and in hot weather, when they have to be picked all at once; a very short season results. But the superintendent of the biggest cannery at Los Angeles says his contract growers have already planted much acreage and that all will be planted by June 1. The first named authority is more in touch with the Central California fields. Planted in August, the crop is harvested in October-November and the picking season is longer by reason of cooler weather.

Most thorough preparation of the soil before planting is necessary. It should be plowed early and deeply. Then, just before planting, it should be cultivated and harrowed smooth. Late experiments have demonstrated the value of trench planting in many districts. Tomato roots must be kept cool, and to insure this some plant in deep furrows and as the plants are cultivated later the furrows become filled and the roots are left well covered with soil. In some districts and in some soils this is not advisable, but it is good practice for the summer crop. Distance apart is another varying factor. Where plants grow rankly, six by six feet is practiced, or even greater distances. The plant growth in each field must determine this point.

What Varieties?

The dealer who ships to Central California says the demand is, first, for the Stone; second, for San Jose Canner; with the Baltimore a poor third. The Los Angeles canner quoted contracted last year for Stone and San Jose in equal acreage, but this year it is all San Jose. The tonnage is most variable. It is reported that ten to 14 tons is the range throughout the state, but the total in the Los Angeles district does not run above seven or eight tons to the acre, though as high as 25 tons have been grown.

In the best tomato district no irrigation is necessary, for good preparation, followed by two cultivations after planting, carries the crop through to maturity in good condition. It has come to be the common practice to have professional growers furnish field grown plants, and one such in Los Angeles County now has orders for more than 3,000,000 plants. These are packed in moss and shipped to all parts of the south half of the state. The advantage of this is that growers can get their plants just when they need them and the propagation cannot interfere with farm routine. While canners contract for plants, they are shipped from propagator direct to grower. The returns last year ran from $17 to $20 a ton, the latter figure being paid in several districts.

Tomato Troubles

Winter blight comes only after rains commence and is not therefore of importance to growers of the summer crop. The blossom end rot in some sections is serious at times and is controlled only by excellent care of the plants throughout the season. Anthracnose or ripe rot is found but occasionally, and loss is small, but if serious Bordeaux spray is the remedy. Nematodes are a pest in a few sections in sandy soil and of course control is difficult and is a matter of dealing with the soil by changing crops.

The most serious trouble experienced by California growers is summer blight or wilt, and this has been the cause of enormous losses. When fields become affected the disease generally increases very fast until a large part is affected, yet in other fields its progress is slow. No effective means of control have yet been found. When once a field is affected it should be abandoned for tomato growing, also the seed bed. Get new seed, new seed bed, new field. The hope of the future lies in breeding blight resistant varieties.

CANTALOUPES IN IMPERIAL VALLEY

(Continued from Page 769.)

1920, there were 21,920 acres planted, estimated that ten or eleven thousand cars will be shipped, but on account of serious car shortage due to railroad strikes, it is estimated that there will not be over 4.500 to 5,000 cars moved.

Last season there were 3,500 cars on hand in this vicinity on the first day of May. At the present writing there are no cars on hand and there cannot be expected more than 150 cars to come to the valley each day after they commence to arrive, and it is a question when they will be moving to the valley. All other products will have to be moved, including the great orange crop of Southern California.

There are 500 cars needed for Imperial Valley tomatoes, 1,500 cars for Coachella Valley onions and 1,500 cars for Southern California early potatoes. The first and second are now moving and the third will soon be. There are 150 cars daily for citrus fruits and 100 cars for vegetables. By these figures one gets a better conception of the outlook. The railroad officials say that it is a physical impossibility for them to meet the situation.

Somehow there are conditons of nature that enter in, to assist in adjusting our affairs which may prove a benefit in disguise. On account of ten days' cold weather, accompanied by extra strong west winds, the possible large crop has been cut down, perhaps 25 per cent in some sections, the soft sandy soil districts suffering more than other sections due to the blowing sand cutting the young plants.

In ordinary seasons there are from seven to eleven melons on the crown, or first, setting, but in many cases there are only from one to five melons on the first setting, and the second setting is not as strong and vigorous as desired. This condition will cut down

HEADLIGHT OVERALLS
UNION MADE
OUTWEAR TWO ORDINARY PAIR

Consider the Guarantee Along With the Price

We guarantee Headlights to outwear two pairs of ordinary overalls. Consider this when you are pricing overalls; and bear in mind that Headlights are roomier and more comfortable than other overalls, due to the generous measure of denim that we put into them.

Port Huron, Mich. and Perth Amboy, N. J.

Canadian Factory: Toronto, Ontario (41)

the yield and assist in the car shortage adjustment, which of course is unfortunate and not desired by those interested in these crops mentioned.

The season will not open until about May 25 on account of the cold windy weather. There are 30 distributors, a few of whom do their own growing, who will handle the shipments. The largest acreage, handled by a distributing company, has 2,000 acres; three have around 1,600 acres; seven, about 1,000 each; a dozen, from 500 to 800 each; the rest between 200 and 300 acres each. The largest acreage is in the Brawley district, Heber second and Westmoreland third.

The distributors assist the Japanese growers by advancing money for the growing of the crop, having a contract with the growers covering all particulars, and it is some lengthy one at that. They have made advances to the growers of from $40 to $75 per acre, which means an expenditure of at least $4,000,000 by them, to say nothing of labor and expenses by the grower.

The following is a list of the different items of expense in bringing a crop of cantaloupes to picking time: Rent of land, $45; plowing three times, $18; floating and bedding, $5; planting and covers, $25; seed, $2.50; thinning, $5; hoeing twice, $4; clutivating three times, $3; turning vines, $1; irrigation labor, $3; total cost of production, $111.50.

Covering means covering each planted hill with oiled paper, held in place with a small wire over each hill. There are 1,200 plants to the acre. This means is used in early planting which is done the last of December and the first of January. Plantings made later in the season are not covered.

Harvesting and marketing expenses are as follows: Picking and packing, per crate, 35 cents; crates, 30 cents; paper wrappers, six cents; hauling from the field, one cent; hauling to the shipping shed, eight cents; total, 80 cents.

The average freight expense to Eastern points is $1.20 per crate. There is an average of 45 melons to the crate and 336 crates to the car. Commission for selling by the distributors is 15 per cent of the gross sales. A good average yield per acre is 200 crates. With the above figures anyone who is interested can figure out the cost of production and marketing.

With a car shortage, not over half being available, this will mean that not over 100 crates per acre will be shipped, which will mean that the melons will have to sell for $3 per crate for the growers to come out even without sustaining a loss.

The federal bureau of markets will have a representative in the valley to handle the marketing as usual. The horticultural commissioner is now arranging for the required number of inspectors to properly inspect the crop under the standardization law which in substance requires that all cantaloupes, as well as all other fruits and vegetables specified, shall be mature, not overripe, virtually uniform in quality and size, virtually free from insect and fungous pests, rots, bruises, sunburn and other serious defects. All crates have standard size, all others marked irregular pack. All crates must be marked with name of grower, packer or shipper and post office of same with number of melons in each crate.

Anyone violating any section or part thereof is guilty of a misdemeanor.

Icing cars: It takes nearly 18 tons of ice to keep the melons in proper condition to the Eastern destination. The cars are iced while empty, using 11,000 pounds, then placed at a loading shed. When loaded they are re-iced, requiring 5,500 pounds. At Yuma 4,000 pounds are used, at Tucson 3,500 pounds, El Paso 3,500 pounds, and three more times to Chicago, using 6,000 pounds, and once more east of Chicago, taking 1,400 pounds.

When one realizes the enormous amount of labor in picking, hauling and loading and the icing before and after loading, and 300 cars are shipped daily for some time, he can understand something of the vast business involved in the cantaloupe industry. Last year the entire business of handling 8,800 cars was done in about six weeks. The highest number shipped in one day was 352 cars.

Riverside County is trying tobacco culture.

STANDARDIZED BERRIES

The standardization law which went into effect January 1, 1920, is working woe to the dishonest berry growers and dealers, particularly in regard to deceptive pack. The law states:

"Deceptive pack shall mean any package of fruit or vegetables which has in the outer layer or exposed surface fruit or vegetables that are so superior in quality or condition to those in the interior of the package or the unexposed portion as to materially misrepresent the entire contents."

It further specifies that the product shall be mature, uniform in size, free from insect or other pests, frost damage, sunburn and other serious defects not to exceed ten per cent, except in grapes, which shall not be more than three per cent defective. Standard sizes for containers are specified for all herries, apricots, almonds, cantaloupes, cherries, grapes, onions, peaches, pears, plums, potatoes (sweet and white), prunes, quinces, tomatoes, walnuts and oranges.

In all parts of the state reports show that prosecutions under this law are gratifying in results. In the Los Angeles courts during the past week there have been 26 convictions. In three cases strawberries were seized on retail stalls and both grower and retailer fined $25 each. In 11 cases seized from growers at the city market all were fined $35 each. One potato grower was fined $35, another $25, and the retailer who offered them for sale $50. The latter was Chinese; all the others were Japanese.

SUPERVISORS ENDORSE STATE FAIR

Resolved, that the California Supervisors' Convention endorse the state fair as a proper and representative institution for the advertising and display of the products and resources of the entire state through county exhibits as the logical units, and be it further resolved that this convention cordially endorse the action of the directors of the state agricultural society for the development of the state's resources and wealth, and urge upon all boards of supervisors the duty of providing funds for the annual exposition of the agricultural, mineral and manufactured products of California through representative exhibits from their respective counties.

CANARY ISLAND ONIONS

The 1920 yield of onion seed in the Canary Islands will be light, a matter of some interest to us, for about 85 per cent of it is exported to the United States. The greater part is contracted for in advance by American seedsmen. In 1918 we bought there $100,000 worth of onion seed, but in 1919 we purchased but three-fourths that amount.

FROM COFFEE TO COTTON

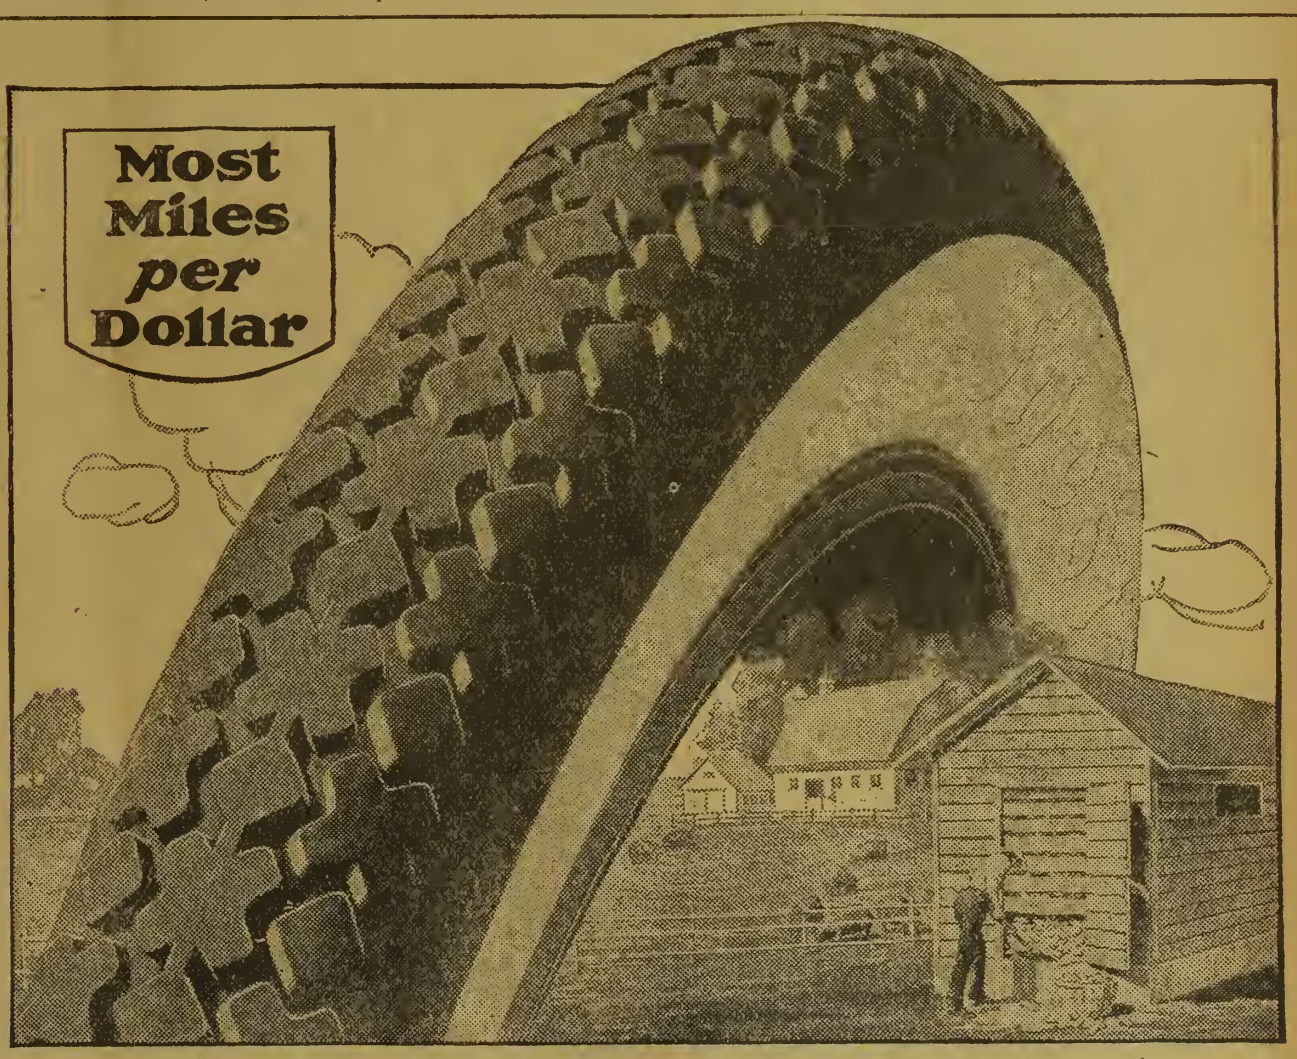
The state of Sao Paulo, Brazil, in parts of which the climate is like that of California, experienced killing frosts in July, 1918, which resulted in the growers turning from coffee to cotton. Mr. Navarro of Sao Paulo, agricultural expert, whom the writer has met, states that their landscapes much resemble ours, the most dominant feature being farm plantations of Australian eucalypts. Brazilian railroads have planted many thousands of acres of these trees, far surpassing in extent the plantings in California.

AMERICAN GINSENG

The port of Hongkong in 1919 received from the United States more ginseng roots than from all other sources combined. Out of a total value of $3,475,722, we furnished root to the value of $2,695,642. Many experiments have been made in California with the growing of ginseng in commercial quantities, but so far as we know none of them have been successful.

SUGAR FROM CUBA

During 1919 the United States imported from Cuba more than twice as much sugar, in value, as in 1918. From the Cienfuegos district in 1918 we obtained sugar valued at $16,514,200, and in 1919 it increased to a value of $36,701,015.



GOOD *and* PLENTY

THIS Firestone Cord Tire is of generous proportions—built to the largest standard oversize established by the industry. Built into it are mileage, safety and comfort—"good and plenty."

There is much greater air capacity than the average, much more material, and it delivers extra mileage as a natural result. The thick, heavy tread performs as good as it looks. It checks skidding, sliding or spinning of wheels.

Equip with a set of these Firestone Cords and let them demonstrate to you the value of their extra size and extra heavy tread. Through Firestone planning, resources and methods this cord tire is produced and sold at a price that gives you most miles per dollar.

Southern California Holstein Breeders Sale

The public sale of 100 registered Holsteins by Southern California breeders at Clearwater on April 27-28 accomplished in a large way the placing of foundation breeding animals in the hands of new breeders. Fifty-four individual buyers absorbed the offering, the largest number of buyers that has yet appeared in a western sale, and the cattle all remain in Southern California within a radius of 75 miles of Los Angeles.

While no unusual prices were recorded, and many real bargains passed through the sale ring, yet the total of $3,090 for 100 head was a quite satisfactory average.

The top price of the sale was reached when It Wavelet Segis, a two year old daughter of It consigned by Chas. S. Harrington sold for $1,025 to H. H. Covell.

The top price for female of milking age was fetched by Aralia Rosa, a 24 pound three year old consigned by A. J. Stalder and sold for an even $1,000 to Clyde D. Kennedy. She is a granddaughter of Prince Gelsche Walker and looked one of the bargains of the sale.

The top yearling female was Burr Farm Veeman Creamelle, a beautiful young daughter of Sir Veeman Korndyke Pontiac consigned by Burr Farm and sold for $600 to H. H. Covell.

The top bull was King Paul Korndyke Vale sold to H. Vosburgh for $1,000 and consigned by W. D. Millard.

The top bull under service age was a three months old son of Sir Veeman Korndyke Pontiac consigned by Burr Farm and sold for $300 to J. M. Mayo.

The 100 head sold for a total of $30,090, an average of $300.90.

Col. Ben A. Rhoades and Harold B. Rhoades did their usual effective work as auctioneers in the sale which was managed by California Breeders Sales and Pedigree Company, Sacramento.

Following is a complete list of animals sold with date of birth, price and name of buyer:

Consigned by W. D. Millard, Arcadia

King Paul Korndyke Vale, May 25, 1916, H. Vosburg, Monrovia, $1,000.
Lady Riverside Burke, Jan. 5, 1914, Agee Bros., Rivera, $415.
Bull Calf, Sept. 30, 1919, L. B. Van Blaricon, El Monte, $275.
Crumpy Wonder Aonda, Oct. 2, 1911, C. S. Ostergard, Hyde Park, $500.
Heifer Calf, Dec. 24, 1919, Ernest Otto McClure, Santa Ana, $135.
Abbie Korndyke Pontiac, Feb. 12, 1919, C. S. Ostergard, $415.
Heifer Calf, March 4, 1920, Burr Farm, Los Angeles, $95.
Queen Sharlet 2nd, May 10, 1913, H. Vosburgh, $475.
Queen Helen Korndyke, July 26, 1915, Chas. S. Harrington, Compton, $425.
Queen Belle Sharlet, Nov. 17, 1918, E. H. Thompson, Burbank, $195.
Romeo Pietertje Lass, Oct. 20, 1916, E. T. Hanning, Long Beach, $240.
Bull Calf, Oct. 15, 1919, B. S. Anslyn, Los Angeles, $65.
Sadie Adiantum Pontiac, Jan. 19, 1914. T. Parker, Pasadena, $325.
Heifer Calf, Oct. 14, 1919, Ernest Otto McClure, $105.
Lyda Beets De Kol, May 18, 1914, Elmer E. McConnell, Lankershim, $295.
Bull Calf, Sept. 28, 1919, C. S. Ostergard, $65.
Queen Pontiac Korndyke Sadie Vale, Nov. 7, 1915, Elmer E. McConnell, $375.
Mercedes Pontiac Nachefe, Jan. 20, 1918, J. C. McGrath, Artesia, $400.
St. Segis Wavelet, March 9, 1918, H. Vosburgh, $400.
Princess Pauline Alcartra, March 12, 1916, T. Parker, $350.
Heifer calf, Feb. 15, 1920, Ernest Otto McClure, $95.
Sharlet De Kol, Sept. 12, 1914, Carl Ettensperger, Pasadena, $810.
Bull calf, March 20, 1920, C. A. Phillips, Norwalk, $100.
Aaggie Wayne Hengerveld, Feb. 24, 1915, Elmer E. McConnell, $375.
May De Kol Pondyke, Nov. 28, 1914, J. C. McGrath, $190.
Heifer calf, Oct. 12, 1919, Ernest Otto McClure, $150.
Heifer, Oct. 31, 1918, B. S. Anslyn, $245.
Candida of Sleepy Hollow, Feb. 12, 1904, John Bottema, Clearwater, $215.
Heifer calf, Sept. 2, 1919, Josh L. Wilson, Jr., Lamanda Park, $205.
Mary Marmion, Sept. 18, 1913, Burr Farm, $350.
Bull calf, June 7, 1919, Bray S. Hicks, El Monte, $150.
Mabel Vale Nephele, Jan. 12, 1916, J. C. McGrath, $200.
Bull calf, May 21, 1919, N. A. Gray, Chatsworth, $105.
Bull calf, July 17, 1919, Geo. N. Henderson, Norwalk, $150.
Sarcanda Candida, July 30, 1918, Agee Bros. $205.
Heifer calf, July 14, 1919, Ernest Otto McClure, $180.
Maid Meditation 2nd, April 12, 1915, Geo. Tadema, Clearwater, $325.
Juliana De Kol Segis, March 27, 1915, John Bottema, Clearwater, $300.
Josie Pondyke De Kol, Oct. 2, 1915, Burr Farm, $390.
Josie Pondyke De Kol 2nd, May 26, 1919, Joseph Telford, Clearwater, $200.
Candida of Sleepy Hollow 3d, Feb. 26, 1915, Geo. Tadema $345.
Juliana De Kol Segis 3d, Aug. 17, 1919, Ernest Otto McClure, $175.
Hillview Shadeland De Kol, Oct. 10, 1915, John Bottema, $350.
Heifer calf, Anita M. Baldwin, $135.
Josie De Kol Fobes Tritonia 3d, Oct. 16, 1916, Chas. S. Harrington, $500.
Bull, Jan. 24, 1919, E. D. Brown, Hynes, $200.
Heifer calf, Jan. 24, 1920, Chas. S. Harrington, $180.
Bull calf, July 25, 1919, Geo. Tadema, $70.
Aralia Candida De Kol, Oct. 25, 1918, F. H. Helm, Monrovia, $180.
Heifer calf, Nov. 22, 1919, Ernest Otto McClure, $175.

Consigned by Chas. S. Harrington, Compton

It Wavelet Segis, March 9, 1918, H. H. Covell, Buena Park, $1,025.
It Claria Pontiac, Feb. 4, 1919, Ernest Otto McClure, $300.
It Yoshida, Nov. 25, 1918, Geo. Hight, Compton, $325.
Aro Aaggie Holland, Aug. 6, 1918, H. H. Covell, $325.

Consigned by Bost & Johnstone, Corona

Duchess Clothilde Segis, Jan. 20, 1916, W. L. Dukes, Compton, $300.
Lady Vale Newtonia, June 23, 1917, T. H. Brice, Los Angeles, $325.

Consigned by Rosamaines Rancho, Stalder Bros., Riverside

Aralia Rose, Oct. 20, 1916, Clyde D. Kennedy, Hemet, $1,000.
Alma Alcartra Sarcastic, April 11, 1916, Frampton Bros., Artesia, $275.
Heifer calf, July 9, 1919, Burr Farm, $160.
Whittier Pontiac Favorite 2nd, Dec. 26, 1914, F. F. Pellissier, Whittier, $350.
True Fayne De Kol Jane, March 22, 1918, W. L. Dukes, $310.
Heifer calf, April 22, 1920, J. A. Hamner, Riverside, $90.
Bull, Nov. 23, 1918, Wm. R. Heldoorn, Hynes, $205.
Bull, Nov. 14, 1918, J. H. Buster, Compton, $260.

Consigned by P. H. Krick, Anaheim

K. P. N. S. Spofford 2nd, March 30, 1918, Burr Farm, $150.
Lady Clorinda Pontiac, Jan. 24, 1916, J. F. Holland, $280.
Bull calf, Oct. 20, 1919, John Pearson, El Monte, $55.
Colantha Netherland Aaggie De Kol, Jan. 1, 1918, Chas. Harrington, $200.
K. P. N. S. Spofford, Nov. 24, 1916, Bost & Johnstone, $105.
Claria Pontiac Topsy, May 9, 1913, J. A. Hamner, $105.

Consigned by Burr Farm, Los Angeles

Changeling Tidy Abbekerk Florence, Aug. 8, 1911, J. M. Mayo, $600.
Burr Farm Veeman Creamelle, Jan. 26, 1919, H. H. Covell, $600.
Mollie Creamelle, Apr. 8, 1912, Bost & Johnstone, $725.
Dodo Pietertje Korndyke, Feb. 2, 1911, J. M. Mayo, $475.
Nemea De Kol Pontiac, June 28, 1914, T. H. Brice, $200.
Burr Farm Veeman Brudorin, Feb. 2, 1919, D. D. Elmore, Whittier, $310.
Ida Hengerveld Ormsby De Kol, Feb. 25, 1920, J. A. Hamner, Riverside, $250.
Burr De Kol Pontiac, Dec. 24, 1918, J. A. Hamner, $210.
Canary Korndyke Mercedes, April 5, 1914, T. H. Brice, $200.
Winsome Juliana, July 12, 1913, T. H. Brice, $310.
Creole Belle Netherland 3d, Feb. 27, 1913, J. M. Mayo, $575.
Durmelia 2nd, Dec. 8, 1909, F. F. Pellissier, $550.
La Reina Hartog Hengerveld, July 30, 1914. J. M. Mayo, $425.
Helm Segis Aaggie Korndyke, Aug. 26, 1916, J. L. Durrell, Hynes, $320.
Julietta Pontiac Paul, Feb. 14, 1913, J. M. Mayo, $375.
Topsy Clothilde Hengerveld, Dec. 30, 1908, J. M. Mayo, $500.
Heifer calf, Jan. 13, 1920, John Houston, El Monte, $100.
Heifer, F. F. Pellissier, $350.

Consigned by W. T. McAllister, Los Angeles

Mary Juliana Alcartra, Sept. 6, 1916, Wm. R. Heldoorn, $200.
Locust Terrace Goldie, Jan. 3, 1911, Wm. Marriott, Hynes, $300.
Fanny Segis De Kol, March 2, 1916, Burr Farm, $300.
Canary Fanny Pauline 2nd, March 25, 1912, F. F. Pellissier, $340.
K. P. N. S. Pontiac, Jan. 20, 1917, Burr Farm, $175.
Bull calf, Nov. 19, 1919, C. C. Stafford, $50.

Consigned by Agee Bros., Rivera

Bull, born Feb. 19, 1919, T. H. Logan El Monte, $160.
Bull, born April 1, 1919, M. del Georgia, Buena Park, $250.
Favorite Rowena Clothilde, Oct. 31, 1916, Burr Farm, $210.
Isabella Crane of Lucerne 2nd, July 14, 1912, Geo. Houston, $220.
Paragon Ormsby Segis, March 5, 1918, H. H. Covell, $425.

IMPORTS FROM MANITOBA

The United States imports from Manitoba, Canada, for the first three months in 1920 were valued at $10,578,601, an increase over the first quarter of 1919 of more than $2,235,000. These increases were in flaxseed, wheat, rye, hides, lumber, furs, flour, and newsprint paper. There were decreases in the imports of cattle and fish over those of last year.

Facts in BLACK & WHITE

Purebred Holstein Cattle in the North West

The North Dakota Farmer recommends Holsteins and reports: "The United States Government and the experiment station when selecting cattle for the breeding circuit at New Salem chose this breed as being best adapted to conditions." Holsteins are strong and healthy and do well in any climate. On account of their great yield they are the most economical producers of butterfat.

SWINE INTEREST GROWS
By T. J. Hitte

In the San Fernando Valley the pure bred swine interest is assuming proportions that reflect the real importance of the pork making industry in California.

Something more than a year ago a few of the leading breeders of Duroc-Jerseys held a get-to-gether meeting at Van Nuys which resulted in the organization of a local association to be known as the San Fernando Valley Duroc-Jersey Breeders' Association. Today the association has a membership of 25 or 30, with a splendid interest prevailing throughout its ranks.

On a recent trip into the valley by the writer a few short stops were made that indicate fine progress and high anticipations as to the big livestock shows in the south end of the state.

A real live wire breeder here is L. R. Hitchcock. Mr. Hitchcock believes in being always on the job, and is giving close attention to all details of his business. The fact is he saves practically every pig that is farrowed, and he makes the most of that pig from that time forward. Last year he had about 16 young boars that were good enough to bring $125 each for the entire lot. The crack spring litter now numbers 12 out of Superb Rose, a Graham bred sow and sired by the noted reserve champion boar, May Rose King, owned at Elliott-Brant Rancho. These pigs are of March 10 farrow, strictly large for age, and shapely to the very dot. As futurity prospects they are right at the top. Princess Pat has fine litter of nine by the herd boar Nutmeg Gano. Her last year's litter of eight sold for an even $900. Jeanette is a big yearling raising nine good pigs by same sire. Model Lassie, daughter of Great Model, has nine beauties by Winsor's Giant Orion. Red D. Maid has eight by the noted Orion's King Gano.

At the L. & M. Ranch, Leest and Meunier, owners, may be seen choice sows and litters. Among these is a Top Sensation third litter of ten, two fine litters by Winsor's Giant Orion, and another of 11 by May Rose King, right age and caliber for futurity stuff. At the head of the herd is the very toppy young boar Liberty L. & M. Orion Defender. He is sired by Cherry Volunteer 2d and out of Ireland's Queen by Orion's Cherry King 5th. He is a big stretchy fellow, well up on his pins and is sure to set a fast pace in senior boar pig class.

At the Penfield & Maxwell Ranch are seen a pair of big fall yearling daughters of Orion's King Gano that are to be mated to the noted Cajon Ranch boar Pathfinder's Pride. These sows were raised at the L. & M. Ranch, and they are as good as the best. Mr. Maxwell figures that they are too good to make show stuff of.

Witt & Huey have recently laid foundation for a good herd near Lankershim. They own the young boar Pathfinder's Wonder by Pathfinder's Pride, and out of a Great Model dam, that gives fine promise. They likewise have an outstanding September gilt by California Orion Cherry King. Will exhibit at Los Angeles Livestock Show.

MERCED COUNTY PURE BRED BREEDERS FORM AN ASSOCIATION

As a result of a meeting of the pure bred breeders held recently, an organization was formed, not definitely named yet, but a suggestion was given out that the Merced County Pure Bred Breeders Association be the name. J. F. McSwain of Plainsburg was elected president and E. E. Greenough of Merced, secretary-treasurer.

The purposes of the new organization are: To boost the pure bred sire campaign carried on by the farm bureau; to do all in its power to foster the boys and girls agricultural clubs; to work with the chamber of commerce and board of supervisors toward establishing permanent grounds for county fairs and livestock shows.

This meeting was called by the farm bureau and there were representatives there of the Poland China, Jersey and Duroc-Jersey Breeders Associations. Besides these, there were representative Holstein, Hampshire, Guernsey and some pure bred poultry breeders.

Attend the Kern County Pig Club Sale

at Bakersfield, Cal. Saturday, May 15th, 1920

Featuring

The Kern County Pilot

The Kern County Pilot

This remarkable young boar is a full brother to The Pilot, Grand Champion at the National Swine Show and The Yankee recently sold for $40,000, the world's record price for a Poland China boar.

The offering includes three sows with litters by The Kern County Pilot. Twenty sows and gilts bred for early fall litters and twenty open gilts sold with breeding privilege. Everything to the service of The Kern County Pilot.

For Catalog and information write

H. K. Dickson, Pig Club Leader

Bakersfield, Cal.

Lendorris Liberty Bond, Skyrocket and Lendorris Liberator,

are our three herd boars.

They are a combination of the most popular blood lines and their individual excellence assures the purchaser of Poland Chinas the great size and quality desired by all. Our sow herd is in keeping with our three good boars.

A few choice individuals for sale at all times. We solicit your correspondence.

W. L. Haag and Son Hanford, Cal.

Do You Know?

That the WESTERNER is a son of BIG BOB—the greatest sire of BIG TYPE POLANDS that the breed has ever known? The progeny and direct descendants of BIG BOB have won near 75 per cent of the ribbons at the National Swine Show since its origin?

REMEMBER that THE WESTERNER is a son of BIG BOB, the sire of sires.

ALEX. D. McCARTY RIVERINA FARMS MODESTO, CAL.

For easy feeding, early maturing Poland Chinas,

Secure the Get of Model Big Fellow

He was Reserve Grand Champion at the last state fair and was next in line to Giant Bob, later sold for the highest price ever paid on the coast. I solicit your correspondence.

J. F. McSwain Merced, Cal.

FORRESTVIEW BOB

A Son of the Noted Caldwells's Big Bob

is the boar that is siring the class of Poland Chinas that have made it possible for me to have so many satisfied customers. They are my specialty. I strive to please.

J. H. Cook Paradise, Cal.

California Cultivator
Costs Only $1.00 Yearly

Fortuna Herd of Polands

Fraziers Model 659594, is a sow of extreme size and correct type. Her pedigree combines the best of Big Bob, Long Big Bone, Big Timm and A Wonder breeding. On March 25 she farrowed a litter of 13, by "The Californian." There is an outstanding boar pig in this litter. Write us about him.

Hugh C. Shinn, Tulare, Cal.

We Are Offering for Quick Sale Two Tried Sires

California Jumbo Buster and Blue Valley King

These two boars have sired a class of Poland Chinas that have made it possible for us to secure an ever increasing patronage. Write us at once. We feel sure you will be interested.

A. Buckland & Son, R.F.D., Fresno, Cal.

THE SEQUOIAN

One of the Largest Yearlings in the State, Heads My Herd

He is a young boar of great promise and bids fair to develop into a remarkable sire of big type Polands. Young stock of both sexes for sale at very reasonable prices.

Z. M. Dickey **Dinuba, Cal.**

I AM STILL OFFERING

exceptional POLAND CHINA values in breeding stock for quick sale. I can fill most any order you want from choice pigs to mature animals. Prices reasonable. I can please you. Write and see.

Eugene Miner **Lodi, Cal.**

Aviator A strictly big type boar that is siring a class of young Polands of the really big type. We expect to show this good boar and some of his get at the state fair this year. Satisfaction assured on any purchase you make of us.

CROSS BROS **MERCED, CAL.**

Trewhitt's Big Type Poland Chinas

have long been noted for their size and feeding qualities and have been bought by the leading breeders of the state for the improvement of their herds. Select your next purchase from a herd where you have the assurance of something better.

W. D. Trewhitt **Hanford, Cal.**

King's Big Bone Leader

is siring the big stretchy type of Poland Chinas sought by the discriminating breeder. He is assisted by Giant Bob 2nd, a son of the late grand champion and a pig of great promise.
Write for information. Stock for sale at all times.

Les McCracken **Ripon, Cal.**

McCune's Quality Herd

of BIG TYPE POLAND CHINAS

attained their prominence by a careful study of blood lines and individuality necessary to real constructive breeding. We produce the type you need in your herd. A few choice individuals for sale at all times.

H. D. McCUNE, **Lemoore, Calif.**

Fitting Hogs for the Show

By J. P. Bennett

It is not too early for the breeder who seriously contemplates entering animals in the show ring this fall to begin fitting the individuals. The old adage concerning the early bird and the worm might fittingly be applied here for, as a rule, it is the breeder who has given months of time and careful, intelligent attention to his offerings in fitting them, who is counted among those holding high stakes at the final showdown. Individuality in animals, conditions and climate make it impossible to suggest a set formula to follow in developing the individual to bring out its best points, but there are some general rules which might well be borne in mind at this time, altering them to suit one's own particular need.

The exhibitor of today and the exhibitor of yesterday have vastly different ideals of type and fitness, hence the animals must be developed along modern lines. One of the greatest improvements in show ring standards is the demand for growth and development rather than merely high flesh. Only a few years ago it was almost impossible to win at the leading shows without fattening the animal to such a degree that it oftimes seriously impaired its value as a breeder and sometimes altogether destroyed its future usefulness. This may all be overcome by proper and intelligent care in fitting. Today the demand is for size, growth, mellowness and good flesh rather than being merely overfat.

The hog is the most plastic of all breeds of animals. Thus it requires even more study of the individual animal and its particular need in the line of feed and the method best suited to its development. Pigs from the same litter may not all thrive under the same treatment, and it is almost always necessary to divide litters into groups, seemingly best suited, and that have the same natural tendency, handling them according to their need if they are to develop and grow out uniformly.

The feed and care of pigs for show purposes should start before the pig is farrowed by giving the sow the proper ration and care, thus aiding toward a strong, healthy litter that will have a running start on the rapid growth necessary to gain large weight at an early age. The man who has milk in any form to feed his show prospects has an advantage if he balances the milk with other feeds. The ideal pasture is alfalfa. The spring and fall pigs can be fitted on much the same ration and it must be one high in protein to insure growth. A wider ration may be used for the older animals. Exercise is very essential, not only to the health of the animal but to strengthen the legs and pasterns in order to carry the increasing weight. Great stress may be laid on exercise. Many otherwise great hogs have been defeated in the show ring because they were down in the pasterns, simply due to lack of exercise, and this condition can come on before one realizes it unless he is systematic in daily exercise. As show time approaches the grain ration may be increased as necessary to bring on the bloom of condition so much desired. The successful showman soon learns to proportion the feeds at his command to obtain the best results. Wheat bran and middlings, with a little tankage and oil meal, are the best growing feeds, especially if some milk can be added to the ration. Either buttermilk or sweet milk will answer the purpose. These, supplemented with alfalfa, will give good results. As the end of the fitting season approaches, grain should be added to harden the flesh. Too soft a feed will often cause waviness and unevenness in fleshing, a condition to be studiously avoided. Great attention should be paid to the feet. Keep them trimmed to keep the animals on their toes. A heavy pocket knife will answer the purpose on the young stuff, trimming the toe back to as near as is safe and smoothing the surface down with a rasp. On the larger animals a pair of hoof nippers may be necessary and if the animal is restless or unruly it is often best to snub it to a post with a small noose around the upper jaw, being sure to get it back of the tusks. A sharp wood chisel and mallet will be best for trimming the first part of the hoof, smoothing and shaping with a rasp. Care must be taken not to cut into the quick and lame the animal. However, in case this is done the fresh surface should be painted with iodine.

Aged boars should have their tusks removed, not only for safety in handling, but to make them more quiet and feed better.

The coat needs some care and attention. Unless the larger animals are shedding at present it would be advisable to clip them as soon as possible in order to grow a new coat before show time. There are methods of feeding that will cause shedding, but at this time of year, with the time of preparation none too long at best, it may be safest to make sure by clipping. An occasional spraying with some of the coal tar dips will keep the vermin away, loosen the scurf and improve the texture of the hair. At show time a light oil dressing is all that is desired if applied to a clean surface. Most old exhibitors have their favorite dressing and guard their formula very carefully. However, some light oil such as a light castor or low grade olive oil, cut with alcohol, applied lightly just before showing, will add much to the beauty of the black breeds. The use of lampblack and fish oil should be discontinued if used at all, as they are certainly an abomination.

The outlook for a great hog show at the California state fair is the best in the history of the institution, as many breeders have already declared their intention of showing, and I take this opportunity to urge a longer feeding period and more careful fitting than ever before, as there will be classy competition in all breeds and the ribbon is certainly compensation for any amount of time and trouble.

Sonoma Sheepmen Strong for State Pool

A meeting of the Sonoma County farm bureau wool pool committee was held in Santa Rosa April 23 to discuss the progress so far obtained and detailed plans for future work. The following were present: C. P. Smith, Santa Rosa; T. B. Purvine, Petaluma; Wm. Caughey, Santa Rosa; A. B. Purvine, Petaluma; Henry Rued, Santa Rosa; Paul Rued, Santa Rosa; C. W. Hunt, Petaluma; I. H. Stice, Petaluma; Mrs. C. Bassett, Fallon; T. F. Miller, Sebastopol; B. B. Hinshaw, Petaluma; Wm. Steinbeck, Bloomfield; S. B. Wright, Santa Rosa; Rene Guillou, Windsor; S. W. Baker, Santa Rosa; W. H. Heileman, Berkeley; Acting County Agent Melvin W. Buster and Assistant County Agent Henry P. Everett.

Prof. W. H. Heileman, secretary of the state farm bureau federation, was present to explain the general plan of this statewide pool and answer questions regarding the details of the system. This work will be carried on under the direct leadership of the state wool committee, composed of experienced and responsible wool growers, which in turn is under the supervision of the marketing department of the California farm bureau federation at Berkeley. In the separate counties the work is done by a local committee under the supervision of the farm adviser and the board of directors of the farm bureau. Only the spring wool clip will be accepted in this pool. This wool will be gathered into carload lots and consigned direct to the National Wool Warehouse and Storage Company of Chicago, where it will be graded and stored until sold. A commission charge of three cents per pound will be charged by this company to cover the unloading and shipping of the wool out of the warehouse, grading, insuring, storage for five months, and selling. The sale will be made under the direct supervision of the state wool pool committee, which is composed of seven men who are them-

selves large sheepmen of this state. In Sonoma County the following committee is in charge of the work preparatory to sending the wool to Chicago: B. B. Hinshaw, chairman; Paul Rued, Rene Guillou, O. N. Charles, Arthur Purvine, Robt. Caughey, Wm. F. Holmes, Jr. This committee will see the various wool growers who wish to pool their wool and have them sign a membership agreement. Later, when the wool has all been clipped, a date will be set to assemble this wool into carload lots and make the necessary tabulations prior to its leaving the county. Each grower's wool will be handled and graded separately and separate returns made on the basis of quality.

At the conclusion of the meeting all those present expressed themselves as being heartily in sympathy with the plan and voted unanimously to enter the state wool pool.

WINNERS IN STUDENTS JUDGING CONTEST

At the finals of the first annual university farm livestock judging contest, held at the university farm, Davis, on picnic day, April 24, five classes of livestock were judged. The judging was limited to men of the college of agriculture and of the university farm school who were among the 20 highest in the preliminary contest which had been held during the past month.

J. A. Murdy of the university farm scored the highest and was awarded the California Cultivator annual trophy to the champion judge of all classes of livestock. W. M. Stevenson, university farm, was second and received the California Breeders' Sales and Pedigree Company medal. The third highest score was received by L. S. Brown of the university farm. He was presented with the Western Meat Company's prize, "a trip to San Francisco to go through the packing plant." L. C. Jones, a farm school student, was the best judge of Southdown sheep and was given the Southdown association prize. The Poland China Breeders Association awarded to J. A. Waters the prize for the best judge of hogs. Scott Harrington won the California Cattlemen's Association trophy for the best judge of beef cattle. The latter two men were the only two men from the University of California who came out on top in the finals. The best judge of dairy cattle was L. S. Brown, who received the W. H. Dupee trophy for the best judge of Guernsey cattle. W. M. Stephenson, a farm school student, recently from the University of California and of Cornell university, won the cup offered by Mrs. Anita Baldwin to the best judge of Percheron horses.

CATTLE AND SHEEP CONVENTION FOR FLAGSTAFF

Hugh Campbell, president of the Arizona Wool Growers Association, states that a combined meeting of the Arizona Wool Growers Association and the Arizona State Cattle Growers Association is to be held at Flagstaff, July 7 and 8. The combined convention is sure to bring out a large attendance, as it is expected that Secretary of Agriculture Edwin T. Meredith will be present, also other prominent national livestock leaders and forest officials, including W. B. Greeley, recently appointed chief of the U. S. forest service, and E. A. Sherman, associate forester in charge of grazing on the national forests.

The chief topic of the joint summer convention will relate to grazing on the national forests, which is a subject of vital importance to both cattle and sheep men.

There are eight national forests in Arizona, with a combined area of 11,000,000 acres, which is 15 per cent of the entire area of the state. Grazing permits have been issued by the United States department of agriculture to Arizona stockmen this year for 352,200 head of cattle and horses, 365,500 head of sheep and goats and 1,855 head of swine.

The officers of the Arizona Wool Growers are Hugh Campbell, president, and Judge Perkins, secretary, with headquarters at Flagstaff.

The officers of the Arizona Cattle Growers are C. P. Mullen, president, and F. E. Schneider, secretary, with headquarters at Phoenix.

SHORT COURSES

The university farm is announcing its 1920 short courses. The first of these will have to do with gas tractors, June 1 to June 11. The greater number of the courses, however, are in the later period, September-December.

The course on general agriculture extends from September 27 to November 13.

Crop production, Sptember 27 to October 16; animal husbandry, October 18 to November 6; farm horticulture, November 8 to November 13; poultry husbandry, September 27 to November 6; dairy manufacturers, October 11 to November 6; milk testing, October 11 to October 23; buttermaking, October 25 to November 6; cheesemaking, October 25 to November 6; deciduous fruits, November 29 to December 11.

The purpose of the farmers' short courses is to enable persons, especially those of mature years and ranch experience, to acquire a knowledge of the fundamental principles of agriculture and of the results of the latest investigations in the production of fruit, field and forage crops, and livestock of the various classes. These courses also furnish an excellent opportunity for people without ranch experience who expect to engage in some line of agriculture, to obtain both theoretical and practical instruction that will prove of the greatest value to them in their farming operations.

A Modern California Livestock Farm

Caledonia Farms, West Sacramento, owned by Edward Cebrian, is one of the real assets of California and typifies the present trend in our pure bred livestock development. At Caledonia Farms there is one of the largest and choicest collection of Shorthorns owned in America. The first sale from this herd will be held at the farm, Thursday, May 27. Good land, good cattle, good buildings go hand in hand and make for prosperous communities. There is room in this state for many more such farms—Photo by McCurry.

Rough's Big Type Poland Chinas

All Our Offerings Are at Private Treaty

Home of the Grand Champion Superba

Our Poland Chinas are the genuine big type in blood and in reality—the offspring of the great Superba—the king of the big type Polands on the Pacific Coast. They also carry the close-up blood lines of such noted sires as Big Bob, Big Orange and A Wonder. It is the real pork type, the prolific type, the feeders type. They make the ideal mothers, and they tip the scales at any age, six months and up.

Our herd is absolutely clean—never a case of abortion in the herd.

SUPERBUS BY SUPERBA—Young show boar prospect; on dam's side close descendant of A Wonder and Big Orange.

NO RESERVATIONS

This herd is today in the prime of its usefulness. We are not closing out, but we aim to please buyers and will permit them to select from anything in the herd. With a few exceptions our big young sows will be sold open, or they will be bred to order. Can show you sows with fine litters or sows carrying litters. Every animal in herd (except spring pigs) is recorded and papers go with every animal sold. Herd is open to inspection any day and every day. Write for particular information. Letters promptly answered.

To Whom It May Concern: The writer has probably as close and thorough an acquaintance with Poland China breeding herds in the Middle West, as well as throughout the state of California, as any man in the state. It should, therefore, be of some interest and value to all concerned to know that he considers the W. H. Rough herd at Arlington second to none in the matter of popular bloodlines, size, stamina, prolificacy and high feeding qualities.—T. J. Hitte.

SUPREMIS—Big yearling son of Superba; sire of 63 pigs in spring litters—average 8 1-3 pigs to litter. His sire Superba won grand champion at the P. P. I. E.; also won grand championship and three firsts in four Corn Belt states. His dam Lady Lenature is an 800 lb. sow in breeding condition. She was shown in same rings with Superba, always standing first and first against all breeds at K. C. Royal.

BIG SIS 64TH with litter of 11, by Supremis. She is of Blue Valley Gold Dust and Big Long Jumbo blood lines.

BIG SIS 63D, suckling 9 by Supremis, a perfect type of brood sow, litter mate to Big Sis 64th.

Some of Our Big Yearling Daughters of Superba

HERD SIRES

Boquhan Guinea Stamp, the great imported Young Broadhooks bull. Golden Goods Jr, sire of LITTLE SWEETHEART, Grand Champion International Show, Chicago, 1919.

Bulls and heifers for sale.

Duroc-Jersey hogs for sale.

James McDonnell, Supt.

The Get of Vaughn's Jones

are of such uniform excellence as to class him with the most prepotent sires in the state.

All his pigs measure up to the same high standard of excellence sought by careful breeders of Poland China hogs. Come and see for yourself.

A. J. Van Cleef Riverdale, Cal.

PICTURES TELL BETTER SIRES MESSAGE

He who runs may read the message told in the accompanying photographs—a remarkable series depicting the unmistakable benefits arising from the use of pure bred sires. "Little Gay," 17 years old when this picture was taken, is the starting point of this better stock story, which is told by a far sighted farmer near Dresser Junction, Wisconsin. This native white mare at 17 years of age weighed 975 pounds. "Not much to look at," but by right breeding splendid results were obtained, as the following pictures show.

Daisy, the daughter of Little Gay by a pure bred Percheron stallion, was 11 years old when this picture was taken; she weighed 1,400 pounds. This animal is no worse and no better than many so called "plugs" upon the average American farm.

Proper breeding produced the splendid offspring "Trixy," who was the third cross from the old white mare. Trixy begins to show results of careful breeding. She is seven-eighths Percheron, and at three years of age

The Pictures Which Tell the Story

weighed 1,500 pounds. Queen, her full sister, is another good farm animal and at four years of age weighed 1,650 pounds. When better sires will bring about such results, why should any farmer continue to use grade or scrub sires?

Registered Hereford Bulls

We have a few choice bulls from one to three years old for sale.
Our Breeding Herd was purchased from the most noted breeders of the Middle West, and are of Anxiety Breeding.

Worms

Horse has worms. What shall I do for it?—Subscriber, Compton.

There are worms and worms and the treatment for stomach worms is so different from that used for pin worms or tape worms that the one asking the question should always tell the kind of worm the horse is infested with. Pin worms are only found in the last bowel and in the rectum, and medicine given in the feed will never reach them, as the strength is all gone before it gets back that far. Pin worms are only reached by enemas. Make a tobacco decoction by steeping a package of scrap tobacco in two gallons of boiling water for half an hour. Strain and when cool inject all at one time. Repeat this every day for a week. The stomach worm, which is about the size of a lead pencil and eight or ten inches long, can be destroyed by medicine in the feed For it mix three ounces of powdered areca nut, three ounces of powdered gentian, one ounce of sulphate of iron and four ounces of bicarbonate of soda. Divide into 20 powders and give one every morning in the feed. Worms are an indication of overfeeding. Regulate the feed so the horse will get one pound of hay to every 100 pounds it weighs, every 24 hours, and half as much grain when the horse is not working. He should have the same weight of grain when working as he gets of hay.

Cat Sick

I have a cat that has been sick three days. Will not eat nor drink. Acts like a chicken with the roup. Eyes and nose are running and she has a cough.—Subscriber, Fresno.

Cats are hard to treat. They do not like medicine and when you put it down them they usually throw it up. It acts a little like poison in this case. The best thing to keep a cat in good health is to give a small amount of dried catnip occasionally You can get it at most druggists.

Distemper

We have a dog that has been suffering for a couple of weeks with what our neighbors say is distemper He has lost appetite and flesh, coughs, and his eyes are sore and mattery. He is less than two years old. What will relieve him?—Subscriber, Klink.

The symptoms are those of distemper, but after two weeks it is practically impossible to cure him completely. You can help him some by giving five grains of calomel once a week for three or four weeks. Feed him raw meat and hard bread. If his muscles begin to jerk he should have one one-hundredth grain dose of strychnia once a day. Keep him in the open, in the sunshine, as much as possible. Distemper can be cured when taken at the very start by giving a good dose of calomel and following in about 12 hours with a large emetic of strong salt water given warm.

THANKS THE CULTIVATOR

Davis, Cal., April 28, 1920. California Cultivator, Ochsner Building, Sacramento, Cal.—

Dear Mr. Royce:

In accordance with the rules of the livestock judging contest recently held at the university farm, Davis, I have been designated the winner of the California Cultivator trophy, which has been presented to me. It is a trophy I shall always be proud of and I am taking this means of thanking you in a small measure for it.

I hope that this contest will be continued in the future, as it certainly is a means of promoting interest in the livestock industry.

Again thanking you. I remain, Sincerely Yours, J. A. Murdy, Jr., Davis, Cal.

First Public Sale
Caledonia Farms' Shorthorns

At the Farms, West Sacramento, Cal., Thursday, May 27

70 Scotch and Scotch Topped Females 70

30 will sell with calves at foot. 20 will calve before August 1st. Balance are bred.

Imp. Caledonia

Gainford Matchless

A Great Opportunity for Western Cattlemen

This offering is presented to furnish beginners and established breeders an opportunity to select female foundation material. Besides the large number selling with calves at foot or due to calve shortly, practically all will carry the service of IMP. CALEDONIA, one of the great bulls of the breed; GAINFORD MATCHLESS, grand champion at the 1919 San Francisco show, or PINE GROVE KING, a proven sire of merit. There are listed daughters of GLENNBROOKS MARQUIS, sire of the dam of the many sensational productions in the university herd; FOND LAVENDER, WHITEHALL KING, LAVENDER DIAMOND, CHAMPION OF SCOTLAND, KING OF PAICINES, PINE GROVE KING, SPICY PRINCE, FAYETTES MASTER, WHITHALL OF ORANGE, BUTTERFLY VISCOUNT, BAPTON PRIDE and others.

No better opportunity has been presented Western buyers in search of desirable Shorthorn females bred to as great outstanding sires. Make a start with Shorthorns now—it is profitable and pleasant business.

MANAGEMENT
California Breeders Sales and Pedigree Company
C. L. Hughes, Manager, Sacramento, Calif.

What is Meant by "Throw and Blow"

Most ensilage cutters have three or four fans on the cutting wheel. This means that each fan must elevate 1-3 or 1-4 of all the silage at every turn of the cutting wheel. When the cutter is working at maximum speed, the cut ensilage accumulates too quickly for the fans to elevate it with the result that it clogs in the pipe.

The Papec Ensilage Cutter has six fans on the cutting wheel. Each fan elevates but 1-6 of all the silage cut at a turn of the wheel. Naturally the six fans pick up and elevate the cut material more evenly and with less liability of clogging.

Moreover the fans in the Papec are set at such an angle that the ensilage leaving the wheel receives the full benefit of the centrifugal force—being elevated for 20 feet before the air blast is necessary to complete the operation.

This is but one of the many Papec features to which we invite comparison with any other ensilage cutter.

SIMPLEX SILO

It is better to start with the right principles than to be continually changing ideas as time proves them incorrect.

A silo should be air tight, sturdy, with smooth and perpendicular inside walls. The fact that the "Simplex" Silo complied with these requirements at the very beginning has gained for it the reputation of being scientifically correct.

Careful Inspection of Every Part

DE LAVAL

For Forty Years the World's Standard

Perfectly designed, with a staff of skilled engineers constantly striving to improve it, the De Laval is built of the best of materials, by the best of mechanics, and with the best of equipment—with forty years of experience behind it.

Every piece of material and every part is carefully inspected and tested. The limit of permissible variation in size of most of its parts is less than one-thousandth of an inch.

These are the basic reasons why the De Laval costs more, does better work, produces a better product, requires less attention, and lasts far longer than inferior separators.

Your local De Laval Agent will be glad to demonstrate the superiority of the De Laval. If you don't know him please simply address the nearest main office, as below.

Dairymen Organize

About 20 of the leading dairymen of Los Angeles County met on April 24 at the court house and organized a dairy department of the Los Angeles County farm bureau. The reasons for this action are that the dairymen had no general organization in the county; the meetings of the farm bureau had little interest for them, being given over largely to fruits, etc., and that the farm bureau was doing no comprehensive work for them, merely testing cows for production.

There are at present three cow testing associations in the county, having about 3,500 cows under observation, but no other work is done. The new organization has its own officers, will call its own meetings, and discuss such questions as are of most vital importance to the dairy industry. It will also have specialists in this line of work address them whenever such aid may be procured. The first work will be a membership campaign. Next will come a survey of the dairy industry of the county to determine its extent and its needs.

The officers elected were: Director, Wm. R. Harriman, County Farm; director, G. M. Brown, Burr Creamery; secretary, W. S. Rosecrans; treasurer, Ralph McNees. An executive committee of three consists of: Dr. Maynard Rosenberger, former milk inspector of Los Angeles and now superintendent of the Adohr Farms; F. F. Peilissier, Whittier; I. J. Scott, Pomona. Four important meetings are being held during this week, at which the membership drive will be prosecuted.

The first meeting is with J. J. Jeffries, Burbank, at 1 p. m., May 5; the second at G. A. Brown's, El Monte, at the same hour on May 6; the third with I. J. Scott, Pomona, on May 7. At 11 a. m. on Saturday of this week, at the county farm near Downey, will be held a picnic and free lunch. At each of these meetings Dean H. E Van Norman of the state farm at Davis, and S. H. Green of the California Dairy Council, will be the principal speakers. It is expected this last meeting will be a grand rally, and it is hoped everyone will attend who is in anywise interested in the dairy industry.—E. B.

Sudan Grass for Silage

Sudan grass silage has been compared with corn silage in investigations at the Oklahoma experiment station. The grass was cut in the dough stage, cut immediately into three-fourths inch lengths and put into a cylindrical silo made of galvanized iron whose dimensions were four by nine feet, according to C. T. Dowell and W. G. Friedmann, writing in the station's 29th annual report. The weight of the grass put in was 2,095 pounds, and to this was added 697 pounds of water. The silage was thoroughly packed while being put in, and a circular top was placed on it. On this were placed three concrete weights, making a total weight of 1,262 pounds.

A Tractor Which Becomes a "Stationary"

The tractor is a dual purpose or, better, a many purpose addition to the farm. Its duty is not ended when the implements are propelled, but it may be brought into use for pumping, wood sawing, feed grinding, or many other uses, including that shown above, cutting and elevating silage.

After 245 days the weights and top were removed and the weight of the spoiled silage was taken; 10.12 per cent of the silage was spoiled. This per cent is not large when the size of the silo is considered. It was found by comparing the density of this silage with a sample of corn silage, which was put up at the same time and in the same kind of silo, that it was only 54 per cent of that of corn silage. This would indicate that the silage was not as compact as the corn silage and therefore would permit a greater spoilage than in the case of the corn silage, but this is shown not to be true.

Possibly the most important thing noticed in connection with this silage is that more reducing sugars were found in the mature silage than in the fresh silage. It should be noted also that there is only one-tenth of one per cent of sugar present in the fresh silage, and yet the silage was kept in perfect condition. This is contrary to the commonly accepted belief that in order for a field crop to be suitable for silage material it is necessary for it to contain a considerable amount of sugars so as to produce the acids necessary for preservation by fermentation.

Mr. Bayliss, herdsman at the college, states that this silage was eaten by cattle very freely. This probably would not be expected to be the case, since the grass, especially the stems, was quite tough at the time the silage was put up and would certainly point out the advantage of using the grass in the form of silage, since the stems would not be eaten if it were in the form of hay.

It is shown that the density of Sudan grass silage is 54 per cent of that of corn silage, both being put up under like conditions.

The loss due to spoiling in a cylindrical metallic silo containing 2,772 pounds was 10.1 per cent. This loss is small when the size of the silo is taken into account.

The silage kept perfectly in spite of the fact that practically no sugars were present in the green Sudan grass.

Three acids—acetic, propionic and lactic—were identified.

Sudan grass is particularly adapted to Texas, Western Oklahoma, Western Kansas, the middle section of Nebraska and a portion of South Dakota. It is one of the sorghums, and the time and manner of planting it are similar to those of other sorghums. Sudan thrives well and generally is reliable in territory where there is too little moisture for some of the legume hay crops.

An Indiana farmer, Edward Overman of Grant County, has been growing Sudan for five years and says he will continue to do so until something better is discovered. "Some are not satisfied with it," he says in the Indiana Farmer's Guide, "because they

Beef Cattle Specialist

For 30 years I have been devoting my entire time to pure bred beef cattle. I know where and how to buy. I make regular trips to the great producing centers and will buy on order. Best of references. Satisfaction assured. Correspondence invited. R. M. DUNLAP, Hotel Land. Sacramento, Cal.

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

have not learned how to grow and care for it. They permit it to stand until it goes to seed or rust strikes it, when it is not so good.

"Sudan should be planted shallow the latter part of May, when the weather gets warm, and cultivated like corn. It will grow as rapidly as corn, and in six weeks it begins to head and is ready for first cutting. In two weeks it is up 30 inches high and ready for second cutting. If there is plenty of moisture it can be cut again in about three weeks, but it is best to pasture until frost kills it.

"This grass is relished more by cattle and horses than any green feed growing in July and August. It will produce more green feed at this time than any other grass, corn or sorghum. It will make more and better milk than clover and alfalfa, and there is no danger of bloating or digestive trouble. I would certainly claim that Sudan grass cultivated is better adapted to this climate than alfalfa and is more valuable."

STATE WOOL POOL

The California Farm Bureau Federation is organizing a cooperative wool selling pool to cover all the counties in the state. This work will be carried on under the direct leadership of the state wool committee, composed of experienced and responsible wool growers, which in turn is under the supervision of the marketing department of the California farm bureau federation with headquarters at the secretary's office of the California farm bureau federation at Berkeley. In the separate counties the work is done by a local committee under the supervision of the farm adviser and the board of directors of the farm bureau. There is a committee already at work in Sonoma County, consisting of B. B. Hinshaw of Petaluma, Paul Rued of Santa Rosa and Carl Haehl of Cloverdale. This committee will be enlarged to cover every part of the county to insure getting in touch with every sheep man in Sonoma County. At present the work of the committee consists in getting a list of the wool producers and the number of sheep handled by each to have data on which to base future activities.

It is the desire of those behind this movement to secure an equitable price for all spring wool entering the pool, whether from a large or small producer; for the small amounts will be made into carload lots. This wool will be assembled and shipped to some storing house where it will he graded and sold under the direction of a selling committee of the farm bureau composed of sheepmen from all parts of the state.

So far in the history of wool marketing, nothing has been accomplished aside from periodic local pools and the general marketing of wool wherein the individual grower has made consignment through the wool buyer. This is an opportunity for the sheepmen to combine their efforts toward perfecting a system that will adequately care for their wool not only for this season but for the years to come. This wool pool is a trustworthy and economic plan for the disposal of wool wherein all the costs of handling are on a fixed basis, known to everyone, and where the small and large producer are given equal consideration. It is a big opportunity for the wool growers of Sonoma County and it is to be hoped that the plan will receive the hearty cooperation of every sheepman in this county.

IT'S "MILK COW," NOT "MILCH COW"

Hereafter it will be "milk cow" and not "milch cow"—at least so far as the United States department of agriculture is concerned.

This decision marks the termination of a controversy in which etymologists in the department have had not a little interest. Those defending "milch" have pointed to scriptural use and certain of the classics as establishing precedents, while the opposition has contended that dairymen, ranchmen and farmers in generaly use "milk" instead of "milch" almost universally. The advocates of "milk" also favored that word because, they contended, it was more strictly an English word, while "milch" was akin to German. Since Americanization of language as well as ideals is an article in every patriot's creed, it is thought that this last sally of the "milk" defenders helped as much as any to decide the question in their favor.

DISPERSAL

50 Young Registered Holsteins

30 Heifers 20 Bulls
State Fair Grounds, Sacramento
Saturday, May 29

This is a complete dispersal of the remaining stock owned by Henderson Company, all young things under milking age.

THE HEIFERS are mostly granddaughters of King of the Pontiacs, being sired by King Pontiac Segis Inka. They are a beautiful lot and many have high record dams.

THE BULLS are mostly sons of King of the Black & Whites, out of choice dams, and they are a most attractive lot of youngsters.

May 27, Caledonia Farms, West Sacramento.

Duroc-Jerseys

July 21, Elmer Lamb, Ceres.

Dr. C. H. Sears sold to Guy Baldwin of Bakersfield one three year old jack, Missouri Douglass, Jr., dam and sire imported from Missouri.

Stanislaus County will hold a fair this year. Bonds have been voted by the city of Modesto for the purchase of 70 acres near that city for a site for the fair.

Empress Korndyke Pontiac, a junior four year old Holstein owned by Bridgford Company, Patterson, has made a new state record. In 30 days she has to her credit 137.78 pounds butter from 2,607.7 pounds milk. She is a daughter of Spring Farm King Pontiac.

At a recent sale of Aberdeen Angus cattle, all of which were imported, held at Chicago by Carpenter and Ross of Ohio, 121 head of bulls and females sold for $169,100, an average of $1,400 per head. Prices ranged from $275 to $4,100, the latter price being paid by a Missouri firm for the cow, Etheria of Maisemore.

B. O. Cowan of Santa Monica, for many years assistant secretary of the American Shorthorn Breeders Association, has been spending several weeks in the Hawaiian Islands. Writing to the Breeders Gazette, he says that he saw more good Herefords in the Parker Ranch herd than he ever saw in any one herd on the mainland. Hawaii has taken many California Herefords in the last few years and that territory is a fertile field for California breeders to cultivate.

Romie C. Jacks, owner of the Imperial herd of Herefords, writes that he has just sold to the Doheny Oil and Ranch Company of Los Angeles the bull, Wyoming 5th, and ten Anxiety bred heifers. Included in the sale were ten yearling bulls for the Doheny ranch in Santa Barbara County. The Imperial herd, while not old in point of years, was founded on an exceptionally strong foundation.

Azevedo Bros. of San Jose have just purchased from The Lewis Company a good young son of the foundation cow Tora, one of the Stanford bred cows which has proven a very consistent producer. At 12 years one month of age, running at pasture, she has just completed a seven day record of 22.13 pounds of butter, an extremely creditable record for that age, her milk production for 14 days being 1,002.5 pounds.

Clayton N. Slocum, pioneer Duroc-Jersey breeder of Willows, writes that the boar Sensation Wonder 1st, senior and grand champion at the last state fair, died recently from what is thought to have been poisoning. The death of this splendid boar is a severe loss to the Slocum herd and to the Duroc interests of the West. During the last few years Messrs. Slocum have been particularly unfortunate in losing a number of very valuable breeding animals, but they have a world of pluck and every time they meet with a reverse they seem only to come back the stronger. It is such indomitable spirit that wins in the end in the breeding business, as in any other work.

Santa Clara County is to have a new bank, located at San Jose, known as The Growers Bank, which besides serving the fruit interests will cater to the livestock men of the section.

On Saturday, May 15, the Kern County boys pig club will hold its first sale at the Kern County fair grounds at Bakersfield. This will be the first pure bred hog sale ever held in Kern County and will introduce to the public The Kern County Pilot, the $1,000 boar owned by the boys of the union high school. The Poland China breeders of the state owe it to themselves to support this sale as a means of boosting the Poland China hog. The boys and the club leader, H. K. Dickson, are to be commended on the work they are doing for the Poland China industry in their part of the state through the dissemination of better breeding stock. The entire offering of sows and gilts are either bred to or have breeding privilege to The Kern County Pilot.

A Buckland and Son, Fresno, have a late September boar sired by Liberty Bond and out of a King of Wonders sow that is coming in very nice shape, and if he keeps up his present gait will have to be reckoned with at the state fair in September.

Martin J. Haas of College Park, a practical dairyman with a good string of grades, has shown his confidence in registered cattle by purchasing a young bred heifer from The Lewis Company for $800, the animal being in calf to their herd sire, Ormsby Segis Marie Lad.

A short time ago Toyon Farm Association announced their 30,000 pound world's record holder Lady Aaggie Echo Hengerveld. They report still another 30,000 pound junior four year old, Cascade Fleta Johanna. This is truly a great record when one considers that the 30,000 pound cows may literally be counted on the fingers of the two hands. There are now four such cows in California and of these four two are owned by Toyon Farm. This is a record to be proud of, two of the only ten cows in the world. Cascade Fleta Johanna's record is all the more remarkable when one considers the conditions under which it was made. When she first freshened it was not anticipated that she was a potential record breaker. For two months Cascade Fleta received only the ordinary care and feed accorded to a cow on test. She was in a string of others and received just that which they received in care and feed. During this period she forced herself to the front and demanded recognition. Her possibilities were recognized, a box stall was given her, as well as every opportunity that would aid her in her efforts. For nearly seven months of this test period Cascade Fleta Johanna was with calf. This constituted another great handicap. Despite the fact that nearly everything was against her this great cow closed her 365 day test with 30,012.2 pounds of milk to her credit. Had she had a real chance there is no question that the few pounds of milk needed to establish a new world's record would have been forthcoming. She

will get that chance another time and then bang goes another record. She will probably qualify in the ten months after calving division.

Baron Annabel Lilith, one of the tops registered Holstein cows owned by James J. Jeffries, Burbank, recently completed an official record of 38.28 pounds of butter in seven days. She is a big strong individual of excellent type and will be continued on a yearly test. Several cows in the Jeffries herd have recently made 28 and 29 pounds seven day records and twelve are now on yearly test and going strong.

Several more daughters of Sir Veeman Korndyke Pontiac have freshened with first calves and are hitting around 2 pounds butter in seven days in the herd of R. F. Guerin, Visalia. The daughters of this bull start off like real dairy cows and as the bull himself is being given heavy service in the Burr Farm herd at Los Angeles he seems bound to become one of the breed's leading sires in the west.

One of the largest Berkshire deals of the year was recently completed when A. B. Humphrey of Grapewild Farms, Escalon, sold to the Weyl-Zuckerman Company of Stockton, 35 young bred sows and a boar. The sows were mostly daughters of Big Leader. The boar is a son of Fashion Longfellow and out of a Grand Leader 2d dam. The Weyl-Zuckerman Company operate a large farming and vegetable growing company and have found it profitable to maintain a large herd of hogs to consume the waste. Heretofore they have been using grades, but they have become convinced that pure breds will be more profitable. Mr. Humphrey had planned to put the sows sold in an August sale, which of course has been called off. The Grapewild herd has been responsible for the establishment of many important herds during the past few years and it has come to be recnized as one of the leading herds of the breed.

The Redwoods Ayrshire Farm at La Honda recently sold a registered Ayrshire bull to Manuel Peres of the Home Dairy at Palo Alto. The Home Dairy specializes in milk of fine quality for the Stanford University trade. The Redwoods Farm also reports the sale of a bull to G. L. Vanderhooven of Martinez. Mr. Vanderhooven is going to use this Ayrshire on a grade herd with the idea of building up a herd of cows of high butterfat producing ability.

60,000 SHORTHORN PEDIGREE APPLICATIONS

The number of applications for pedigree registration received at the office of the American Shorthorn Breeders Association up to the close of March reached 60.000, approximately half of the total of the previous year, which was a record year. The number sent in during this three month period was increased, naturally, by those desiring to get in before the new rate went into effect. With this large volume of applications on hand the work of delivery is necessarily delayed. While the office space has been enlarged and the office force increased to the limit permitted by the space, there will be a delay in returns on applications until the accumulation has been taken care of. Once this is out of the way there will be a reasonably prompt service assured. However, the regular business continues to grow in volume more rapidly than even the most optimistic predictions forecasted and will involve, evidently, a steady increase of office space, a problem that is not solved on a day's notice, and a proportionate increase of the office force. Ninety clerks are now regularly employed in the office. Unfortunately labor conditions have delayed the plans decided on for the enlargement of the office. A little patience on the part of the Shorthorn people until the present congested condition is taken care of will help materially in the improvement of the situation.

F. W. Heiskell of the International Harvester Company, Chicago, is "doing" California. He has enjoyed California's good roads and is hitting the high spots all the way from Mexicali to Siskiyou.

Speaking of CONCRETE ROADS

More than 5,000 miles of concrete pavements on the basis of an average width of 18 feet were placed under contract in 1919.

Every state—your state—contribute to this wonderful record.

Below are the states in which contracts for more than 30 miles of concrete road were let during 1919

	Miles		Miles
Arkansas	87	New Jersey	87
California	210	New York	329
Delaware	55	Ohio	239
Georgia	90	Oklahoma	69

National Financing of Roads

THE big question of interest in highway legislation before the present session of congress is the Townsend bill, providing for a national highway commission, a nationai highway system and national construction and maintenance of this system. The Townsend bill was introduced in the senate just before the holiday recess.

The attention of farm people has been directed to this hill hy wide publicity given to statements that this particular plan of going forward with a national highway policy had been approved and endorsed by the National Grange, the largest and oldest substantial farmers' organization. The action of the Grange is of interest and importance in this connection because it represents the deliberate judgment of a special committee appointed to consider the matter and this committee had as its chairman, Dr. T. C. Atkeson, the oldest member of the National Grange in point of service and its Washington representative, fully in touch with all the plans and suggestions for nationai highway activity.

The action of the National Grange was contained in three resolutions, two outlined the views of the Grange as to the policy which should be adopted, the third advocated continuance of the present cooperative work until the new comprehensive national policy could be agreed upon by congress and put into operation.

The two resolutions defining the Grange conception of a national highway commission and a national highway system and how to finance it read as follows:

"The present and potential development of high power motor trucks and high speed passenger cars practically revolutionized highway conditions and necessities of this country, and with due regard for the demands of the present and the future necessities for permanent, hard surfaced highways, we believe the time has come when all the national government highway activities should be unified in a single administrative department, under such limitations of powers as will secure the greatest possible degree of efficiency and economy in the expenditure of national funds. We favor the working out of a national highway law that will best serve the welfare of the whole country and distribute the expense of highway construction equitably between the beneficiaries."

Since this resolution was adopted in November the instructions to the Washington representatives of the Grange have been carried out. The Townsend bill has been completed, at least five great national organizations have endorsed it, while a sixth is now taking a referendum on it, and the matter is squarely before congress and the country.

The organizations endorsing the Townsend bill are The American Automobile Association (the automobile users), The National Grange, The National Highway Council, The National Automobile Chamber of Commerce and the United States Chamber of Commerce.

Very briefly, I wish to set forth here the important points covered by the Townsend bill and a brief statement of the argument which has convinced the Grangers that it is based on sound public policy.

The important points covered by the Townsend hill are enumerated in a statement approved by Senator Townsend as follows:

"Authorizes the construction and maintenance of a national system of highways exclusively at the expense of the national government.

"Creates a Federal Highway Commission to be named by the President with the advice and consent of the Senate to take over all the highway functions now exercised by the Department of Agriculture, and to construct and maintain a national highway system. This commission is to consist of five men selected with due regard for geographical representation.

"The national highways shall consist of two main highways in every state, comprising one per cent of the total highway mileage of each state as ascertained by the commission, where one per cent is not sufficient to cause these highways to connect with (a) adjacent states, (b) bordering countries, (c) waterways, the commission is authorized to extend the mileage in that amount.

"The commission is directed to consult the state highway departments as to locations of those highways and is further authorized to have all the work undertaken by the State Highway Department, supervisory power remaining with the Commission.

"In those states where national highways have been constructed to a point deemed adequate for present and future traffic needs by the commission, the commission is authorized to construct an equivalent mileage to that taken over, but maintenance in those cases will rest with the state.

"For the purpose of carrying out the act there is appropriated $50,000,000 which shall become immediately available; $75,000,000 for the fiscal year beginning July 1, 1920, and $100,000,000 for each of the three succeeding years, in all, $425,000,000.

"After making such deductions as may be necessary for administration and maintenance, the commission is directed to allocate the remaining funds between the several states annually in the same ratio that the mileage in each state bears to the total milage selected in all states."

The argument which is controlling the minds of the Granges which have considered this bill and taken action thereon in favor of the plan for a national system of roads built and maintained at national expense comes from one sentence in the Atkeson report quoted above: "Best serve the welfare of the whole country and distribute the expense of highway construction equitably between the beneficiaries." This, they say, the Townsend plan does.

The beneficiary of a highway is very much more than the man who lives on that highway. The economic benefit of good roads is essentially decreased hauling costs. If a road does not do that, it is a special purpose road. Take a road to a summer resort and it has no place in a national or other system. If it does do that and make the delivered costs of wheat, cotton or hogs, butter or oranges cheaper, then it is economically justified.

But the beneficiaries of such a road are not especially or chiefly, sometimes not at all, the people who live on or near that road. Let me illustrate:

The good road, desirable as it may be, does not make a farm raise a bushel more wheat, a pound more cotton, a single extra hog, a pound more of butter, nor an additional box of oranges. The road does not increase production, neither does it increase the cost of production on the farms except as it may cheapen a little the haulage of feed and fertilizer to the farm. The social benefit of the road is to be figured on, of course, but is hard to translate into dollars and cents.

The cost of production and the cost of distribution are two distinct items. After products leave the farm and the farmer they are hauled to market. Whatever the hauling and other distribution costs may be, the consumer pays them. If there are good roads this cost is lessened and the consumer pays less. The "consumer" is everybody, everywhere, more urban than rural; national and not local.

This is why roads are a national problem and why their construction at national cost is a fair distribution of the cost "equitably between the beneficiaries."

A 12-mile road through a farming district in Western New York, built four years ago, is a case exactly in point. Two railroad station villages which it joins have grown and prospered since it was built, but so far as is discernible the individual farms along the road have shown little or no change. Farmers don't talk a lot about this question, but these facts are well understood, and the Townsend plan is the first distinct and decided step in the direction of meeting this situation.

The national financing of roads under the Townsend plan goes only to a system of approximately one per cent of the total mileage of each and all the states. But these national roads will be the most used and most expensive ones. Each state will be relieved of this burden and thereby made able to build a subsidiary system, including the most used and most expensive county roads. Each county in turn can build roads then, having the big overhead cost removed and, in this way, as in no other way yet suggested, is there a chance that the welfare of the whole country will be served, and all the country in the course of the working out of a well developed plan will get some good roads built which will be available, useful, properly maintained, and go somewhere.

Farmers need no one to offer excuses for them, but lest some one should call this plan a subsidy to the country let me suggest that after this is all done the country will still have 90 to 95 per cent of its roads still

FEDERAL

Double Cable Base Tires

Federal White Non-Skid "Rugged" Tread Extra Ply Fabric.

Rim-Chafe Ended, Road-Miles Extended

The Federal Double-Cable-Base puts a stop to rim-wear which causes blow-outs just above the rim, and other costly forms of rim-damage that permanently end a tire's usefulness.

Four cables of stranded steel grip the Federal tire in correct position.

The miles Federals *save* from the rim, you *use* on the road.

The sooner you begin to use Federal Tires, the more miles you can save.

Why not begin now?

ain, old fashioned dirt, sometimes nd, roads, and the country people ill keep right on doing as they have the past, paying all their share of e taxes and maintaining all these rt roads besides.

Farm people and organizations verywhere can do good service now urging favorable action in Con-ress for national highways.

AVINGS EFFECTED AT THE ATH-LONE GRAIN ELEVATOR

Walter Hayes, a large scale farmer ear Athlone in Merced County, and mmett Cunningham, manager of the ank of Italy at Merced, are the prin-pal owners of the elevator building t Athlone, which has been handling rain in bulk during the past two or ree seasons. They are confident at the savings effected have already stified the investment and are more an ever convinced that the use of acks is an economic error.

Mr. Cunningham is no longer an ctive grain raiser, but he would be lad to see the farmers near Athlone vail themselves of the facilities al-eady provided, believing that such course would add to the general pros-erity. Some few changes are neces-ary in the equipment to secure per-ect convenience in handling, in par-icular a new cleaning device should e installed, but in case several more armers wish to come in there will e no difficulty in providing this.

The building has a capacity of 40,-00 bushels, and this, of course, could e used several times over in the ourse of a grain shipping season. It s strongly constructed (of wood), and s conveniently located.

Mr. Hayes is a strong believer in ulk handling and says that he never xpects to handle any large amount in acks. His farm, a mile or so from thlone, is very convenient to the levator, but he also employs the bulk ystem for all the grain grown on nother ranch which he manages and which is more than ten miles away. From there the grain is carried on a truck which operates very efficiently even though the road is wholly un-paved.

Quite a little land near Athlone which has in the past been devoted to grain raising is now being irrigated and planted to grapes and other fruits. Nevertheless, it is clear that wheat, barley and Gyp corn will be very im-portant farm products for at least an-other generation, especially in view of the more satisfactory methods of handling and marketing which are now becoming general.

QUEER DOCTRINE

In an agricultural section of a Sun-day paper we read some queer horti-cultural doctrines. The teaching seem-ed to be entirely against providing a dust mulch to prevent evaporation, lest the roots be smothered for lack of air. To us the article savored more of foolishness than of growers phil-osophy. To regard its teaching one would quit plowing and cultivating be-cause these operations "fill up the pores" and prevent "air laden moist-ure" getting down to the tree roots. A real farmer wonders where one found the notion that unplowed land would take water better than plowed land. Or how, during the rainless summer, a dust mulch can keep "air laden moisture" from going down to the roots. For years we have harbor-ed the notion that said "dust mulch" was to keep moisture from getting out, but lo! we now learn our mistake. It acts just like a rubber blanket to keep all of this copious California July rain carrying wet air down to said roots. Why didn't this Solomon or Daniel "come to judgment" sooner?

All these years we have been wear-ing out our plows, cultivators and horseflesh—to say nothing of our own legs—in the delusion that we were conserving moisture by making dust mulch to fill up cracks. And now alas! we are told we were just smothering the life out of our baby rootlets.

Come on, let's go fishing next June, and leave those big, wide open adobe cracks to admit the "air laden moist-ure" so those tender rootlets can breathe and drink at the same time.—Sunsweet Standard.

Grain Elevator at Athlone

Labor cost, time, storage space, efficiency all encourage bulk handling of grain. Capacity of 40,000 bushels in above elevator.

IMPERIAL GROWING

An interesting fact in the development of Northern Imperial Valley, which is cited by H. H. Clark of Calipatria, a successful farmer, is the interest in the northern district shown by old residents of the valley living in the southern part. This interest is being manifested in a most substantial manner, Mr. Clark points out, since many of the valley residents have invested heavily in lands in the Niland-Calipatria district. The development work done by these buyers is reffected in the northern district, where prosperity is met with on every band.

TRADE WITH EGYPT

During 1917 Egypt imported more than five and a quarter million dollars worth of goods from the United States, but during 1918 less than half that amount, for our consul reports: "No American vessels entered Egyptian ports during 1918." During the same years we purchased nearly $50,000,000 of goods from Egypt. The heaviest purchases we made were of cotton; the heaviest sales were of iron and steel manufactures.

The department of agriculture reports extended investigation into the question of whether cultivation increases rainfall and reports no such increase can be secured, so far as can be judged from 50 year records.

Use Your Fordson Every Month

January
Corn-shelling, feed-grinding, baling, wood-sawing.

February

To get full value from your Fordson tractor, 40% of its working time should be spent in operating belt driven machinery—this is the verdict of leading agricultural authorities.

You can profitably use your Fordson for belt work every month from January to December. Study the "Belt Calendar" at the left.

But there is one vitally important thing to remember—to assure the most satisfactory results you should use the belt especially designed for the Fordson tractor—the Little Giant tractor belt.

The Little Giant tractor belt has a clinging grip that conquers pulley slippage. It has a unique construction that withstands the effects of exposure to all sorts of weather conditions necessary in farm work. It is made of four-folds of a single piece of extra quality, heavy weight canvas duck, closely stitched and specially treated to increase the toughness and wearability. The edges are double stitched to increase the resistance to edge wear.

See the Little Giant at your local Fordson dealer's place of business, or write us direct.

WANTED

I WANT A MAN

A REGULAR MAN!

I am tired trying to get along with inefficient labor. What I want now is a man ambitious, straight-shooting, who knows how to farm, who is honest and not afraid to work or use his head. If I can find such a man, married, of course, who is really capable and familiar with Island farming, I can make him an attractive offer. If you can't fill the bill don't bother to write—but if you can, write Box 913, Sacramento.

Herdsman or Foreman (married) with college training and lifetime experience handling purebred dairy cattle. Will consider change of position, lease or partnership. Familiar with all the fine points of breeding and general dairy farm management. Box 3, California Cultivator.

Wanted—Working Herdsman, single or married; must be a hustler of large experience and capable of taking full charge of 300 dairy cows. A man's job. Address Superintendent Arden Dairy, El Monte, California.

Wanted—To hear from owner of land for sale. O. K. Hawley, Baldwin, Wisconsin.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Seed Not True

In 1919 I ordered from a seed dealer Swedish clover seed. When it grew I found that it was bur clover and there was not a single Swedish clover plant in the whole field, two acres. I have been obliged to buy hay for my animals, as the clover being planted as an intercrop among young trees, it was impossible to turn the animals in and the clover did not grow high enough to cut with a scythe. What are my rights in the matter?—Subscriber, Placerville.

It is the generally accepted rule that on the sale of a seed as being of a particular kind or description stated as a fact, a contract is implied that the article sold is of that kind and description; substantially the description is warranted. To make this rule applicable the circumstances must be such as to amount to representation of fact on the part of the vendor that the article is of a particular kind or description. If the buyer in terms asks for a particular kind of seed and the seller purports to comply with his request, he would probably be held to warrant the article as being of that kind, although be may not have made any declaration in words to that effect. It has also been held that the measure of damages for the breach of warranty as to quality or variety of seed sold to plaintiff is the difference between the value of the crop produced and the crop that would have been produced had there been no breach. Your action, therefore, would be upon the warranty for the difference in value between the two crops

Farmers Retailing

What are the rights of a person in marketing stuff which he has grown on his own farm? Am I compelled to pay for a license or may I be prevented from selling my own products except through dealers?—Subscriber, Siskiyou.

There seems to be no state law governing such matters, although it is possible that there may be some county or other local ordinance. The only thing at all relative to the case is the act known as the state market commission act, which gives the state market commissioner various powers in very general language, but it would hardly seem that such is at all applicable to the case in hand.

Clearing Away Stones

When I cleared my land, the stone was placed on the line with the understanding with the adjoining owner that he would do the same, and together we would build a wall. The neighbor died and the land is unimproved. A new owner has come in and wishes to compel me to move the stone over on my side. I have disposed of my property. Can my neighbor compel either of us to move the stone?—Subscriber, Sunland.

If the agreement between you and your neighbor as to the deposit of the stone was oral, it is probably in no wise binding upon the new owner, as it is generally provided that an agreement for an interest in real property must be in writing and subscribed to by the parties sought to be charged. The above agreement would probably come under this head, as it would constitute an agreement for the use of a certain part of the real property of your neighbor. The agreement not being binding, the neighbor, therefore, has the right to consider this deposit of stones as an encroachment upon his property rights and thereby a nuisance which he may abate himself, if the encroachment is slight. Or he may bring action to compel your successor in interest to the property to remove this stone. As you have parted with the title to the property, it would hardly seem that you are in anywise legally concerned in such action.

GREATER EFFICIENCY

One of the first manufacturers of gas tractors was the C. L. Best Gas Traction Co. For many years they have been delivering to California ranchers Tracklayer tractors, but as long as they have been at the work there are occasionally found some of their very first models still doing effective work in orchard or on ranch. The company now finds it necessary to make extension and $125,000 worth of stock is being placed on the market. The sale of this will enable a greater extension of the business. The present plant covers nine acres of ground and is splendidly equipped, but with their increased capital their outputs can be practically doubled in a very short time. In fact, additional ground has already been secured and the work on additions to the present buildings is under way.

EVERY LACTEIN FED CHICK

is a healthy one

Because it receives the proper nourishment and tonic and is free from disease and ailment of the growing chick. Lactein Condensed Buttermilk furnishes the chick's system with LACTIC ACID developed to the correct proportion for its needs.

FEED FOR PROFIT

The difference between the right food and tonic is just that difference between profit and loss. Lactein Condensed Buttermilk is the profitable food. It is the food that produces health —and a healthy chick is the one that makes the heavy egg producer. Lactein is a proven food —a food that is recognized by the largest poultry raisers as the most profitable.

Put the chicks on a Lactein Diet TODAY.

A Trial Order

Will demonstrate the superiority of LACTEIN — you'll notice the difference in your chicks and poultry.

The Farm Woman's Hens

By Jean A. Koethen

THERE is a little woman up in Madera, a farmer's wife, I feel sure, though she has not said so in so many words, who is tremendously in earnest about this poultry game. She has started in this spring with 50 White Leghorn chicks and is planning for 100 hens and the right size of house to hold them properly. Now she comes with more questions, just the sort which I am sure must bother many beginners. I have not yet forgotten the thrills I felt when my first clutch of eggs began to pip, or how I rushed to my next door neighbor crying, "Oh, Mrs. D., my hen is hatching. What shall I do?" "Don't do anything," was her matter of fact reply. Just leave her alone and she'll hatch them herself."

These are the questions my friend, whom I will call Mrs. S., wishes to have answered:

1. I am wondering if the corn meal mentioned in so many rations is the same corn meal we use in cooking, and which is best, white or yellow.

2. Is dry buttermilk as satisfactory as the fresh? How do you prepare the dry buttermilk and in what proportion do you feed it?

3. Will you please recommend some poultry books and magazines which I would find helpful? I have "Poultry for Profit" and several others.

4. What do you consider a fair price for a good breeding male? Can you give me the names of reliable breeders of White Leghorns and Barred Rocks? I have a circular from a certain Barred Rock breeder who advertises "records up to 260 eggs per year." He charges $7.50 to $35 for males. I should think at those prices a person should be furnished a pedigreed record to show just what they were getting.

5. What age do you consider best for a rooster to mate with pullets?

6. I have one little cockerel that picks a fight with every other little cockerel he meets. I am almost tempted to keep him if I can find out he isn't a brother to the pullets.

7. Most of my chicks weigh one pound at a month old. Is that a decent weight?

8. In selecting a Barred Rock cockerel, which is preferred, the light or dark barred?

I have numbered these questions for convenience in answering them, and will go right down the list:

1. The corn meal used for chickens is coarser than that used for the table, and is generally known as feed meal. It is always yellow. Some poultry people believe that the use of yellow corn affects the whiteness of white chickens, but this would only matter in exhibition fowls. Most of the Leghorns in California have this feed meal as part of their ration, and they do not seem to have suffered.

2. I doubt if any preparation is as satisfactory as fresh buttermilk, but the dry buttermilk and some other preparations, such as Semi-Solid and Lactein, are widely used and very satisfactory. You can buy the dry buttermilk and mix it in the mash in the proportion of from 15 to 20 per cent of the whole (or less if a meat meal is used), or you can buy a buttermilk mash which is very satisfactory for little chicks.

3. I mailed the writer a list of books and magazines, and will just say here that if a comprehensive discussion of poultry husbandry is desired there is nothing better than Harry R. Lewis' "Productive Poultry Husbandry," published by J. B. Lippincott Co., Philadelphia, and Professor Dryden's "Poultry Breeding and Management," published by Orange Judd Co., New York. A good many helpful bulletins can be had free by writing the University of California at Berkeley.

4. This is a little hard to answer, especially as Mrs. S. seems to have utility and fancy mixed up together in her mind. It is a mistake we all make. I remember it took me years to get rid of it. You can get a fair breeding White Leghorn male for $5, and a better one for $10. If you want pedigreed stock from high egg records, you will have to pay as much as $25, and I doubt if there are many breeders who can furnish such a pedigree. Show stock comes $5 up, mostly up, but you do not want show stock if you are breeding for eggs. Hunt up the man who can show a guaranteed egg record and don't bother about feathers. I would rather pay $5 for a bird from any good, vigorous, heavy laying stock than pay $25 for a bird with blue ribbons and no egg record back of him.

5. Yearling roosters, or birds a little older than that, are better to mate with pullets. A fall hatched cockerel is a good mate for pullets of the next spring's hatch. Two year old cocks are all right if they are not too fat. Mating an old cock with about 20 pullets is said to be the secret of securing a preponderance of pullets in the chicks.

6. Keep that fighting cockerel. Chances are he is not full brother to the pullets. If he is it won't matter for once, but I would rather mate him to two year old hens, because they produce larger, stronger chicks.

7. A pound at a month old is just about the average for Leghorns, I think.

8. I think the light barring is more popular, at least most of the Barred Rock males one sees in the shows are light.

Don't Attempt Too Much

Now here is a bit of advice for this ambitious little lady. I hope she will paste it in her mirror or over the kitchen sink or wherever she will see it oftenest. She is treading the path we all have trod, and I would like to keep her from wasting strength and money. She is housewife as well as poultrywoman, with little children to care for, and if she raises 50 White Leghorn pullets this year and gives them the care they need for health and egg production during the coming winter, she will find she is quite busy enough. To undertake utility Leghorns and fancy Rocks both at once is far too much. Only a man who gives his whole time to it can succeed with two breeds. Many and many a novice has tried it and failed. If she prefers Rocks, let her give up the Leghorns, but as she has already quite a start with the Leghorns, it would seem wise to give them a good tryout at least. Feed is going to be dearer than ever this year, we are told, and we all want to travel light.

Feathers or Eggs

Another thing, she must choose between feathers and eggs. She cannot have both. I know there are some fanciers who claim to breed for eggs and some standard bred high producing flocks, and we have several skillful poultry breeders who do know how to breed for eggs and feathers at the same time—at least they say they do—but the novice does not know how, and the sooner she makes up her mind to work for eggs, and eggs alone, the better. Of course she will throw out of the breeding pen any birds that are greatly off color or of poor type, and she will study to find just what the best type of White Leghorn is. In this way, if she is careful about adding new blood, she will soon have a standard bred, heavy laying flock, and that is the best thing there is. The "coming" poultry business is the egg business. It is here now, in fact, and any woman or man may well be proud to help a little in the great movement for better hens and more eggs.

Mrs. S., you will forgive me, I know, for such a long sermon. I want to see you start right and not make the mistakes hundreds of other women have made, to their sorrow.

Poultry Queries

Conducted by J. A. Koethen

Sporadic Diseases

I should like to know more about the diseases which affect not the whole flock, but on occasional bird. In those I have examined I have not found liver or lung trouble. Sometimes the heart seemed small with much white membrane around it.—Mrs. E. W. D., Tancred.

Not much attention is paid to these sporadic diseases and deaths, because as a rule the trouble is discovered too

Sick Baby Chicks?

There is only one way to deal with baby chicks and that is to keep them well. Doctoring a hundred or more chicks is mighty discouraging work.

It's pure carelessness to lose more than 10 per cent of chicks, from hatching to full growth. Many lose 40 per cent to 60 per cent, and even more. No profit in that.

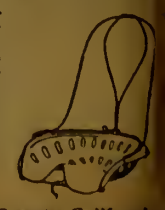
Our book, "Care of Baby Chicks" (free) and a package of Germozone is the best chick insurance. WITH BABY CHICKS YOU MUST PREVENT SICKNESS—NOT ATTEMPT TO CURE. "I never had a sick chick all last season"—C. O. Petrain, Moline, Ill. "Not a case of white diarrhoea in three years"—Ralph Wurst, Erie, Pa. "Have 800 chicks now 5 weeks old and not a single case of bowel trouble"—Mrs. Wm. Christiana, Olive Ridge, New York. "Two weeks after we started last spring we were a mighty discouraged pair. Every day from three to six chicks dead. A neighbor put us next to Germozone and we are now sure if we had had it at the start we would not have lost a single chick"—Wm. E. Shepherd, Scranton, Pa.

GERMOZONE is a wonder worker for chicks, chickens, pigeons, cats, dogs, rabbits or other pet or domestic stock. It is preventive as well as curative, which is ten times better. It is used most extensively for roup, bowel trouble, sniffles, gleet, canker, swelled head, sore head, sores, wounds, loss of fur or feathers. 25c, 75c, $1.50 pkgs. at dealers or postpaid.

GEO. H. LEE CO., Dept. F-30 Omaha, Neb.

Preserve Your Strength by Attaching NATIONAL BACK REST

To the seat of your tractor or farm machinery. It saves your back and you ride in comfort. The National Back Rest fits on nearly any seat no matter what style or shape. It can be quickly and easily attached without the use of tools. No screws or bolts. Will not slip off. Three dollars delivered. Some agency territory still open. Satisfaction guaranteed or money refunded.



CARL G. JORN

Jorn Bldg., 57 Plaza Square, Orange, California

late to be treated. Sometimes a hen falls dead from apoplexy or fatty degeneration of the heart or rupture. Now and then one in a flock may have pneumonia or bronchitis or roup, and not pass it on. Every large flock loses hens every year in this way and expects to. That small heart is probably due to fatty degeneration and is a direct result of overfeeding.

Feeding Ducklings

Please let us know how to feed ducklings. Last year we fed chick feed and lost nearly every one. This year have fed nothing but bread and water, wheat ground at home, and grass cut fine. Do they need grit?—H. J. B., Adams, Oregon.

Ducklings should be fed on a moist mash, and the mash should contain grit or sand as well as ground grain. On one of the big duck ranches near Los Angeles the ducklings are fed the first three days a mixture consisting of 20 pounds bran to 10 boiled eggs from the incubators. Bran and eggs are chopped together and an equal amount of clean sand is added. Then half a dozen heads of lettuce are chopped in, and the whole is made crumbly wet and kept before the birds in a trough all day. After the first week the egg is omitted and the mixture changed to one-third corn meal and two-thirds bran. The green feed is no longer mixed in the mash, but is thrown into the yard once or twice a day. If it is not convenient to feed eggs, you might use rolled oats the first week with the bran and greens and sand. Never omit the sand, Ducks must have it.

Constipated Sitter

A hen we set a week ago never eats or drinks unless we take her off the nest. There has been no bowel movement all this time, and now we notice a watery discharge from the vent. We have given her olive oil, but there is no improvement.—Subscriber, Long Beach.

Sitting hens should be taken from the nest every day if they do not come off themselves. The discharge you have noticed is no doubt the result of the hen's constipated condition. A good dose of Epsom salts is better than olive oil for removing the poison that is clogging her intestines. Give a level teaspoon, dissolved in water and thickened with bran into a crumbly mash. If she will not eat the mash give a tablespoon of castor oil. Epsom salts are not easily given except in mash. You may in this way be able to control the trouble and keep her on the eggs, but it would be better to put another hen in her place if possible.

POULTRY SUPPLIES FAT-SOLUBLE A

After working quietly for ten years Dr. McCollum has been telling the world much that has not been formerly known about fat-soluble A. This is a food factor which Dr. McCollum discovered, which has not yet been named, but which has been found to be absolutely essential in the diet of all animals and human beings.

It is found in leaves of plants so that well fed, mature animals usually secure it in sufficient abundance. Young animals and human beings do not eat a sufficient amount of plant leaves to take care of this dietary essential. They must rely upon some other source.

Dr. McCollum explains that fat-soluble A is found most abundantly in butterfat and egg yolk fat and he also explains that it is to be found around the hearts and livers of animals.

From this it seems that the cow and the hen are the great producers of fat-soluble A—the great essential to a satisfactory human diet.

As this fat-soluble A has been proved beyond dispute to be essential to health, physical and mental development and even to life itself, we are beginning to realize how vastly important the cow and the hen are to mankind.

In one of his lectures, Dr. McCollum gave the Chinese as an illustration of what would become of the human race if a deficiency of the fat-soluble A were permitted in the human diet.

It seems that the Chinese became afflicted with eye trouble. The tissues around the eyes swelled so the eyes could not be opened, the eyeballs became inflamed and later the unfortunate people that were thus afflicted became blind. Medical assistance proved inadequate to cope with the peculiar situation. There being no milk supply in the country, a wise man prescribed eggs and chicken livers. A liberal use of these promptly eliminated the trouble and as a result China became a great poultry and egg producing nation.

So great is the egg production of China that just before the war the many cargoes of eggs that reached this country from there became a worry to our egg industry because the Chinese were able to produce eggs, export them to this country, pay the duty on them and sell them at a lower price than the eggs in this country were bringing.

Dr. McCollum explains the smallness of stature, the lack of mentality and the expressionless faces of the Chinese by the fact that for so many years they failed to eat foods rich in fat-soluble A.

It is very evident from his investigations that the hen is to save the Chinese empire and to make of a people, small of stature and lacking in mental as well as physical ability, a nation of people large of stature and strong, both physically and mentally. That day would be hastened were they to permit the cow to aid the hen.

The lesson to be drawn from Dr. McCollum's investigations, so far as Americans are concerned, is that we should prize highly the cow and the hen, for, according to Dr. McCollum, they have played a large part in making the American people what they are; the strongest people mentally, physically and morally that are known on the face of the globe.

It is well for the cows and the hen to be recognized as the great, profitable and useful mainstays of the American farm.

No dairy farm is complete without a good sized flock of poultry; no poultry farm is complete without a good sized herd of cows and no farm is complete without both.

PARAGUAY TEA

This plant is called yerba mate (pronounced matay) in Spanish speaking countries and is Ilex Paraguayensis to the botanist, a member of the holly family. It may be purchased in any large grocery in California, for its use, while not common, is not confined to any section or any people. The writer has occasionally used it for several years. It is not unlike common tea, but is more stimulating, yet contains no poisonous properties. It is a heart tonic and an aid to digestion and is not astringent. It is pronounced by medical authorities as more stimulating than either tea or coffee, without harmful results unless taken in immoderate quantities, when, as in case of all stimulants, it leaves the drinker languid or tired. In Argentina alone 130 000 tons are consumed annually. The shrub or small tree is native to Paraguay and surrounding countries south and east and has been grown in California.—E. B.

CHINESE WALLS FALL

Vice-Consul Carl D. Meinhardt reports that the old city walls of Canton, China, are being razed, and that wide thoroughfares are to be built on their site, which will increase the demand for motor vehicles in that city. Canton now has only about a dozen automobiles and eight or ten motorcycles.

MUSHROOMS FROM POLAND

Before the war dried mushrooms to the value of $4,000,000 were annually shipped to the United States. The war stopped the output entirely and for the first time since peace was declared there is now an available shipping supply in Poland. The price f. o. b. at Krakow, Poland, is about 25 cents a pound.

GET MORE EGGS.

"Lady Victory"
1918 Champion laid 304 eggs in 365 days. Highest official record of any living hen. She laid 25 eggs in Jan., 27 in Feb., 29 in March.

Milkoline will help make your hens lay more eggs.

Feeding Milkoline will make you more money —reduce mortality of your flock— keep flock healthy and less liable to disease.

Increase Poultry Profits Any poultry raiser can easily double his profits by doubling his egg production. Feeding Milkoline with other feed greatly assists assimilation, keeps digestive organs vigorous and is a wonderful appetizer, tonic and bowel regulator. Milkoline contains nutritive elements vital to egg production and not found in grain rations.

13,000 More Eggs
Jas. E. Keyes, Petaluma, Calif., says: "After feeding Milkoline for eighteen months to 2,500 hens, I find that worms cannot exist in poultry where Milkoline is used. I reduced mortality with laying hens 10 per cent. I increased the egg production of my flock thirteen thousand eggs in one year. Feeding Milkoline to laying hens keeps them in splendid health thereby preventing disease and derangements of all kinds."

Lowers Feeding Cost
Many feeders say Milkoline lowers feeding cost one-third, because their hens assimilate all feed they eat. Our liberal Guaranteed 30 Day Trial Offer enables you to try Milkoline at our risk—to prove that it will make you mighty good money.

Milkoline
has a base of modified buttermilk with essential fats and acids added. Milkoline comes in condensed form. Will not mould, rot or sour. Keeps indefinitely in any climate. Milkoline is simply "Good Buttermilk Made Better for Feeding." Flies don't bother it.

Prevents Disease
Milkoline is not featured as a cure for anything or a preventative, but due to the acidity in the buttermilk it is a germ destroyer and helps keep poultry healthy, which is the best preventative against disease. Milkoline is invaluable as a life saver for baby chicks.

PRICES
These prices are F.O.B. Kansas City or the address of our nearest dealer. Dealers in all parts of the United States.
5 Gal. Keg - $7.50
10 Gal. Keg - 12.50
15 Gal. Keg - 16.50

Prices on smaller packages given in booklet. Buy in barrel lots—it saves you money.

Only 2c a Gallon
For feeding mix one part of Milkoline to 50 parts of water (small feeding 5 tablespoons to gallon of water). Feed either with water or mash feed. Milkoline keeps their appetite keen and its action is highly essential to normal egg production. When fed as directed Milkoline costs only 2c a gallon or less. Tranhaft & Newman, Lankershim, Calif., say: "We would not go back feeding straight buttermilk at any price."

Guaranteed Trial Offer
we will ship you 1 Gallon for $2.25, express prepaid. Take 30 days—feed half to your poultry. If not entirely satisfied simply return unused portion and we will refund every cent you paid us. No charge for portion you have used. Milkoline has been producing so many amazing results and we are so certain of what it will do for you that Milkoline is legally guaranteed to be satisfactory. You are always the judge. We suggest ordering larger quantity—you get the benefit of lower price—you risk nothing—you must be satisfied or we refund every cent you paid us. Make this test now. The sooner you begin using Milkoline the quicker you will be making money.

Los Angeles Markets

Los Angeles, May 5, 1920.

The chief topic of conversation in southern shipping circles is the car shortage. In Southern California alone there is immediate need of 3,000 more cars than are available. This shortage is most keenly felt in the Coachella and Imperial Valleys where the cantaloupe crop awaits transportation. The heaviest returns come, of course, from the earliest shipments. Later the Phoenix, Arizona, crop will compete, and still later that of the Turlock district of Central California. On the Los Angeles market the only newcomer of the week is the blackberry, of fine size and color, evidently a high grade product.

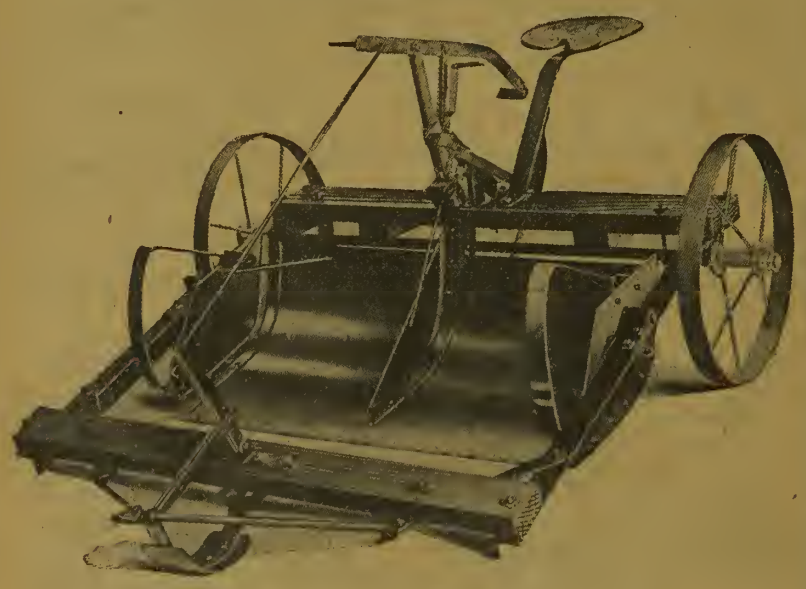
The Miskin Scraper

IS

THE BEST SCRAPER ON EARTH

And we can prove it. Write for circulars



The above is a cut of the Famous Miskin Scraper, which in operation, easy draft, greater capacity, and better work has many advantages over the common Fresno and wheel scrapers now on the market.

Made in 2 horse, 3-horse and 4-horse sizes. The four horse size can be operatd by small tractors from the tractor seat, by the tractor driver.

Send for descriptive circulars, with prices. We pay the freight.

Miskin Scraper Works, Ucon, Idaho

Four Row Bean Cutter

This new invention of C. E. Bouton cuts four rows of beans and places the vines in one windrow; the cutter, running on wheels, is easily operated by two horses. It is a simple and inexpensive attachment for use on your cultivator. Save labor, time and horseflesh. Write or call at

C. E. Bouton Ranch

Oats: Red feed, 3.05@3.15.

Corn: California yellow 3.25@3.35 per cental; Egyptian white, 3.75@3.80; milo maize, 3.25@3.35.

Barley No. 1 Feed, 3.05@3.15.

HAY

Under date of May 5, Scott-Magner says:

Receipts past week 839 tons. Many cars are still at bay shore or on tracks where delivery cannot be obtained. Strike conditions with the railroads show little improvement. This is a severe handicap on all kinds of business. Sales cannot be made with any degree of certainty as to when deliveries can be affected. Stocks on hand in San Francisco are very low, still demand is very light and up to date all have been able to obtain their requirements. In the country districts, however, many points are suffering for lack of hay and orders placed several weeks ago have been canceled owing to railroad non-delivery. This has caused trouble and expense diverting cars shipped to fill them and held up by the railroads at various points.

A schooner load of first crop alfalfa from the river district arrived the latter part of the week and was of exceptional quality for first cutting hay, being practically free from foreign grasses. As no sales have been reported it is impossible to quote prices. The hay appears to be in very good condition and no doubt will bring a good figure.

The most of the arrivals during the week have been of cheat from Oregon and alfalfa from Nevada. We look for very little alfalfa to come in from Nevada in the future as the Ogden market is bidding strongly for what is left in that section owing to shortage and bad weather conditions.

New volunteer hay is being cut in various sections but in general is reported of very short growth with light yield. Prices have been well maintained throughout the week.

We quote today wholesale prices in carload lots as appear from dealer's transfers upon the hay market in San Francisco, for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat hay (light 5 wire bales)	38.00@41.00
No. 1 Wheat or Wheat and Oat hay	35.00@38.00
No. 2 Wheat or Wheat and Oat hay	22.00@35.00
Choice Tame Oat hay	37.00@40.00
Other Tame Oat hay	33.00@37.00
Wild Oat hay	Nominal
Barley hay	Nominal
Alfalfa hay	32.00@37.00
Stock hay	29.00@32.00
Oregon Cheat and Oat mixed	29.00@32.00
No. 1 Barley straw, bale	70@1.00

Citrus Markets

Los Angeles, May 5, 1920.

Navels are closing their season with exceptional prices, and Valencias are coming in with higher prices than ever before at this season of the year. The strike is lifted but there is still a jumble of freight conditions, which prevents free shipping, and picking is still slow. The car shortage s also serious and cantaloupe shippers of Imperial are appealing for every available car.

Lemons are still low but the car shortage is preventing any great number of shipments from California. Imported stuff is meeting the need at all Atlantic coast points. There are now reported between 250,000 and 275,000 boxes in transit or on piers.

Shipments

Shipments of citrus fruit to date from Southern California since November 1, 1919: Oranges, 16,292 cars; lemons, 3,165; total, 19,457. To same date last season: Oranges, 18,821; lemons, 4,473; total, 23,294. From Central California this season: Oranges, 4,570; lemons, 286; total, 4,856. To same date last season: Oranges, 2,538; lemons, 251; total, 2,789. From Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

Tuck Your Hay Into Tight Bales

STACKED hay or hay in the mow does not represent hay at its best. Tuck your hay into snug, tight bales with an INTERNATIONAL HAY PRESS and get all of it under cover. And, too, your livestock will appreciate INTERNATIONAL-BALED hay because of its clean freshness and unimpaired food content. You can ship these snug, tight bales to the outside markets and command top prices. You can bale for your neighbors and make from $15 to $30 a day clear profit. You can bale straw just as well as hay—keep the outfit busy during odd weeks between seasons.

Your light tractor will furnish ample power to operate an INTERNATIONAL POWER PRESS. If you do not have separate power, a 6 h. p. FRICTION CLUTCH INTERNATIONAL KEROSENE ENGINE can be mounted on the front end of the frame of the two smaller size presses and belted direct to the baler—always ready for immediate service. The extra large drive gears compound the engine's power enormously—and make the snug, tight bales of uniform weight that are so characteristically INTERNATIONAL.

INTERNATIONAL HAY PRESSES are made in three sizes—14 x 18, 16 x 18 and 17 x 22—horse and power styles. See your nearby International dealer about one—and meanwhile let us mail you a catalog. Just send us a post-card.

—"and from there we went to Japan"

Talk about adventures!

Men in the Navy come home with the kind of experiences that most chaps read of only in the books.

Here's your chance!

Uncle Sam has, as you know, a big Navy and gives red-blooded young fellows like you an opportunity to step aboard and "shove off".

What will you get out of it?

Just this:

A chance to rub elbows with foreign folks in strange parts of the world.

The chance for good honest work on shipboard—the kind of work that teaches you something real: the kind of work that puts beef on your shoulders and hair on your chest.

You will get 30 care-free vacation days a year, not counting shore leave in home or foreign ports.

You will have the kind of comradeship in travel that sailors know.

You will have regular pay, over and above your meals, lodging and your first uniform outfit—good stuff all of it.

You can join for two years. When you get through you'll be physically and mentally "tuned up" for the rest of your life. You'll be ready through and through for SUCCESS.

There's a Recruiting Station right near you. If you don't know where it is, your Postmaster will be glad to tell you.

To any Father and Mother:—
In the Navy your boy's food, health, work and play, and moral welfare are looked after by responsible experts.

Shove off!-Join the U.S.Navy

Denizens of the Desert

By Ernest Braunton

THERE have been three "cactus crazes" during the last century and 'tis said they occur with some regularity from 25 to 35 years apart. So take warning, for the last one waned and died more than a quarter century ago and there already is manifest a revival of interest in these curious and beautiful plants. To those who have never passed through one of these cactus waves it may seem odd that they are world wide. As Germany is the best market we shall have to wait until normal conditions prevail there.

In the craze of the '90's, toward the close of the last century, the writer filled, for a Los Angeles firm, one order for Erfurt, Germany, of more than 7,000 cactus, and this was but one of many shipments to the same firm. Los Angeles then had 20 retail establishments that sold cacti, San Francisco several, and every large city had one or more. It was at that time the cactus collection was placed in the A. S. White Park at Riverside and hundreds throughout California had good collections. The city of Los Angeles bought a glass house and its cactaceous contents and moved the whole to Lincoln Park. Though not as expensive as the tulip fads of Holland, there were many collections in the United States that ran into thousands of dollars. Of those owned by the public the most extensive was at Carroll Park, Baltimore, Maryland.

The Private Collection of Cacti

The Great Family

The Standard Cyclopedia of Horticulture states: "Scarcely any group in the whole vegetable kingdom is more remarkable for its strange and varied forms, the beauty of its flowers, and wonderful adaptation to desert life. The family is not confined to tropical or even semi-tropical regions. At least two species of opuntia extend northward into British Columbia and several genera and species are found in Colorado. To the southward the family extends to Chile and Argentina. Giant forms are scattered over the plains of Uruguay and some grow amid the snows of the lofty plateau of Bolivia. The tree like forms flourish in the southwestern United States, the Mexican plateau, the peninsula of Lower California, where there are great cactus forests, and the vicinity of Tehuacan, in the southern part of the Mexican state of Puebla, a region celebrated for its remarkable and gigantic tree like forms."

As a matter of fact a hardy species occurs in South Dakota and from there the family extends southwesterly through Mexico, Central and South America until extreme cold stops its journey toward the south pole. But they are all American. Wherever cacti may be found in other parts of the world they all came directly or indirectly from the Americas. Certain species have become a pest in Australia and other countries, while in Palestine and nearby countries, parts of Africa, the shores of the Mediterranean, Ceylon, Mauritius, and other isles, they have escaped from gardens and become naturalized. From snow to the torrid heat of the tropics, from seashore to mountain top and trackless desert, where no soil is in evidence, and even as parasites on lofty trees these curious plants range over a large part of the western hemisphere.

Their Uses

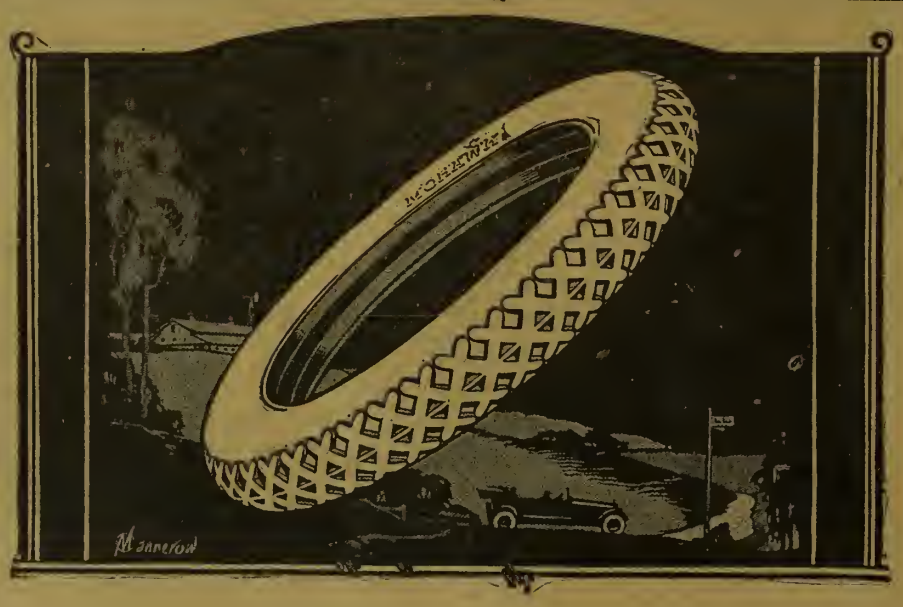
The giant tree like forms, when they die, split up into slats extending from end to end, like elongated battens, and are used for building and fuel. Many kinds are used for hedges, and the island of St. Christopher, owned by two European nations, is divided by a line of cactus sufficiently impenetrable to prevent free intercouse or violation of boundary rights. Certain species are like great barrels filled with watermelon like pulp which is made into conserves like citron, into candy, and put to other uses such as stock food. Some cylindrical forms are made into walking sticks, furniture, napkin rings and other useful or convenient articles. Some of the gigantic columnar species are used for building, even for timbering mines.

The fruits are variable in form, texture and flavor. The blad-apple or leaf apple of the Dutch colonies and the Barbados gooseberry of the British West Indies are one and the same fruit, much used in making tarts and sauce, as are real gooseberries. The triangular stemmed climbing species bear similar but larger fruits of delicious flavor, and other species are known to both Mexicans and Americans as strawberry cacti on account of the fine juicy pulp of the fruits. Some are called cactus limes on account of their acidity, and all are more or less famliar with the tuna fruits, Indian figs, or cactus pears grown on both spiny and spineless tunas or opuntias in California. The seeds of many species, known as "cardones" are used by the Mexican Indians as food. A valuable heart stimulant is made from the night blooming cereus, a deadly alkaloid poison from another species and others have medicinal and other practical and scientific uses.

As Ornamentals

From giants of 60 or more feet high the cacti range downward to buttons of less than an inch diameter. From spines several inches long they soften to downy pin cushions of snowy whiteness, covered with fibrous cotton. From growths as bald and smooth as a marble column they vary to those covered with long snowy hair, the latter species popularly known as "old man cactus."

In general outline or form they are the most curious and striking family in the vegetable kingdom, having a greater range in general appearance than any other group of plants. In flowers they surpass in atractiveness any except the orchids and in size any group other than the water lilies. In range of color they head the list, and nearly all cactus flowers, in addition to brilliancy of color, have their petals overlaid with a satiny sheen that is unequalled. While the greater number blossom by day a number of species burst into blossom only after darkness comes, and these species exhale a strong and delightful fragrance. So fascinating is this wonderful plant family that when a revival of possession of collections takes place it becomes a "craze" that is world wide.



Mohawks Treat You Squarely

The man who buys a Mohawk Tire is usually surprised and delighted at the mileage it gives him.

Experience with other tires has taught him to expect approximately a certain number of miles. When he finds that his Mohawk Tire is yielding from half again to double that amount—naturally, the next tire he buys is a Mohawk.

Then, doubly gratifying is the fact that this next Mohawk does as well—or even better.

In short, he finds that Mohawks give him the sort of treatment he likes from anyone with whom he does business—fair and square—never disappointing—honest and dependable.

And we can offer conclusive proof that this is not an exceptional case, but the universal experience of Mohawk users.

Records kept by our dealers show that 85 out of every 100 who buy their first Mohawk Tires become permanent users. Certainly this is as close to one hundred per cent re-sales as any product can show.

The explanation is simple: Mohawks always have been, and always will be, carefully made by hand, from the purest rubber and the strongest fabric produced.

OUTING

me, let us camp in the open,
he marge of some deep wooded isle,
e care and convention are banished
all the great world seems to smile,

e the wild fowl wheel swiftly above
the furtive mink steals to the shore
drink in the secrets of nature.
grow wise in her wonderful lore.

he raven will wake us at daybreak
h his harsh and his far-reaching
ll,
the waters will lull us at evening,
en the shadows have crept over all.

we'll thrive 'mid the vigorous ac-
on
l bronze 'neath the warm summer's
n!
e mainland we'll swim every morn-
g,
en a new sparkling day has begun.

we'll troll down the shadowy lake-
hore
fish for the musky and pike.
t a thrilling sensation leaps through
ne,
the rush of the game-fish's strike!

we'll plunder the nest of the turtle
d bake luscious clams in the sand
arner our bounteous breakfast
om the fullness of nature's great-
and.

now let us range through the wood-
and,
angle for trout and for bass.
what comfort to loiter at noonday,
retched at length on the velvety
grass!

It's back to the camp fire at sun-
down,
bask in the embers' red glare,
ing our contentment and freedom
d mingle in rollicking air.

hum! Let us take to our blankets.
ginger, how drowsy I feel!
sure I shall sleep like a savage
d be up with the bugle's first peal.
ndsay Gordon Lucas in Boys' Life.

E BROILER OF THE TROPICS

J. Basil Keys in Agricultural Journal of Victoria

ROM Port Said to Yokohama the broiler is the main and very often the only form of fresh meat obtainable by the traveler or white resi-t. This also applies to most parts Africa and to many islands scat-ed about the Indian and Pacific eans; in fact, to all that part of world which lies within the region wn as the Tropics. Pork is usually ntiful, but is not considered whole-ae in hot countries. Beef is scarce l nasty; raising beef especially for d is practically unknown, and it is y when an occasional cart bullock mill bull has outlived his usefulness l threatens to become a dead loss its owner that beef is killed for d. So the resident in a tropical ntry has to depend almost entirely the broiler to supply his table, es-ially in emergencies.

The broiler in these countries is the delicate, milk fed article found Canada or America, but generally ong legged, very worldly wise mem-r of the chicken tribe, who has had wrestle hard for his living, with e eye constantly on the watch for ssible enemies and the other on e lookout for something to steal. hen wanted for the table he is ased by the entire family under ose protection he has been living, d is beaten to death with anything at comes handy.

Although there is always a large d ready sale for poultry and eggs the vicinity of the towns and sea-rts, very few whites seem to have ade any serious attempt at poultry ising as a business. This is mainly cause most of the white residents in ese countries are engaged in enter-ises which leave them very little ne or energy for other work, and if e care of the poultry is left to native rvants the result is almost always sappointing, owing to the natives' nbounded faith in Providence as a bor saving institution. The result that poultry raising is almost en-rely left in the hands of the natives, ho are generally too lazy to go in r it properly, each family keeping st enough hens to eat up their waste od.

Although lazy, the native is distinct-ingenious and his method of brood-g is worthy of notice. Where a num-r of hens are kept for raising broil-s, a few capons of a large breed are ways retained as well for brooding rposes. They are treated as pets the family, so that they become accustomed to being handled. When a hen hatches she is not allowed to waste her time brooding her own chicks. A few days before the chicks are hatched the capon is placed in a coop, and when the chicks are ready he is lifted up carefully at night and a quantity of strong tobacco smoke blown into his face, which for the time being seems to make him quite intoxicated and silly. The chicks are then placed under him. In the morning when he wakes and finds his new family, he seems to take them quite as a matter of course, and when let at large with them in the daytime he scratches and gives them as much, if not more, attention than the hen would. One of the advantages of this system is that chicks from various hens, and differing several days in age, can be placed in the care of one capon.

A big capon will brood as many as 50 chicks, and the hens are turned loose after a few days, to lay and set again. The tropical hen does not usually lay a great number of eggs. She nearly always lays away, and, if possible, hides her nest, setting as soon as she has sufficient eggs, thus clearly showing her near descent from some sort of wild fowl.

The writer has used capons as described above for brooding incubator chicks with marked success, and believes this system is worthy of more general adoption. The Chinese are said to use caponized geese for this purpose, and it is a well known fact that a female goose, if from any cause her own eggs have failed to hatch, will adopt a brood of newly hatched chicks or ducklings.

The great drawback to poultry raising in the Tropics is the abundance of pests. These vary in different countries but are always there in one form or another, the most general thing being hawks and other birds of prey which abound nearly everywhere.

In some of the islands of the Indian Ocean there is a creature known as the tang-rat. It looks like a cross between a rat and a hedgehog and smells like a skunk. This animal is very fond of eggs and the young chicks, but is more dangerous after death than in life. There seems to be an irresistible attraction about a dead tang to the fowl mind. They devour them greedily when rotted and invariably die within a few hours. Their death is said by the natives to be caused by swallowing the small spines which cover these animals.

The iguana is a confirmed poacher, and is found pretty generally all over the tropical parts of Asia. However, he is very easily trapped, as he always follows the same run.

In the Malay Peninsula the local pest is the python or boa constrictor, who takes a regular toll from any fowl house in his vicinity. These snakes are easily shot, as the fowls generally give the alarm when one is around at night. They are sometimes trapped by making the sides of the fowl house of wire netting. The snake enters easily enough through the mesh, but on attempting to escape after having had his feed, that part of his length which contains the swallowed fowls is unable to pass through the netting, and so prevents his escaping before the owner of the poultry arrives and despatches him.

In spite of many disadvantages, provided sufficient care is taken, there is good money to be made at poultry raising in most tropical countries. Land can be rented cheaply; poultry food, such as bananas, tapioca, yams, poonac, broken rice, etc., are easily grown or cheaply bought. Insect food, of course, exists in abundance.

Bananas form an excellent shade in a poultry run. They cost very little to plant and go on bearing for many years with little or no attention. The fruit can be picked in nine months from the time of planting and yields at the rate of about 20 tons per acre. The fruit can be dried in the sun and stored in a dry place for future use, and also makes an excellent flour. The breadfruit and jak fruit are also among the many trees bearing fruit suitable for poultry food. A large breadfruit tree bears from 1,000 to 2,000 fruits each season. The fruit is round and about the size of a Dutch cheese, weighing as a rule three

LOTS of chores about the farm—up late and early—out in all sorts of weather. Farm folks need a food-drink like Ghirardelli's Ground Chocolate—delicious, rich, strengthening! A steaming cup of Ghirardelli's has saved many an exposure from developing into a serious illness. Made in a jiffy, too!

Never sold in bulk—but in cans only.
In ½ lb., 1 lb. and 3 lb. sealed cans—

pounds.

There is plenty of scope for improving the present breed of tropical fowls by importing some heavy pure bred poultry. The local fowl is generally a sort of game and bears a strong resemblance to the wild or jungle fowl.

WHAT IS THE HOMIEST THING?

What is the homiest thing to you, the thing that makes your house a home? Of course you would say first of all: "It's my family that makes my home." But we are going to take for granted the family, the house, the needed furniture, the food — all the absolute essentials to living—and talk of the things that come after the necessities, the things that make life more comfortable and happy and beautiful.

I remember that to my childish mind the distinction between real folks and just people was marked by the presense or non-presence of a piano in the living room. Perhaps that was because of tbe impression of one June day when I was six. Mother called me in from the old live oak on the edge of the vineyard to "see what's in the living room." It was a new shiny, wonderful golden walnut piano! And it were to my little girl eyes a glorious halo of promise of things that were to be. What a joy that piano was to the orchard home miles from the nearest town and railroad!

I'm not sure that my feeling has changed much yet! Of course I have found that gardens and orchards and open fires are not to be taken for granted—as I then supposed—but still the piano seems a center of happy home gatherings, of school day parties, of the dreams and memories of the twilight hour, of all the priceless homey days of a happy childhood and older life.

But this subject is open for discussion. Is it the piano to you, the library, the fireplace, the easy chair, the phonograph, the table linen and silver, the auto, the telephone, the views from the windows, the reading lamps, the pictures, the electric labor savers, the bath room, the rose pergola, the grape arbor? What is it that you would choose to keep beyond the necessities, if you must forego all but one of the—not luxuries—but happy, comfortable things in your home?

Prize Offer

For best letter answer $2 cash; second best $1; for all published, one year's subscription to the California Cultivator.

With your letter be sure to send name and address of one to whom you wish subscription credited.

Please write on one side of paper only—the kind doesn't matter, wrapping paper does very well, but please, for the printer's sake, write on one side only.

Letters should reach this office, Household Department, California Cultivator, Los Angeles, by Monday, May 17. They will appear in the Cultivater of May 29.—R. P. D.

WAYS TO USE CHUCK

Chuck Steak With Onions

2 pounds chuck steak, 5 or 6 onions, salt, butter.

Slice onions in water. Drain thoroughly. Place onions in a shallow saucepan, cover closely and cook over a slow fire for 15 or 20 minutes till tender. Use no water or fat as the onions contain both moisture and richness. Heat a frying pan smoking hot, and brown the steak quickly on both sides; add onions, reduce the heat and turn the meat frequently until it is cooked through. Season the steak and salt the onions. Serve the meat on a platter with onions around it. Add butter.

Beefsteak Pie

Chuck steak, cut in narrow strips; sprig of parsley, 1 onion, 1 cup sliced carrots, 1 cup celery cut in strips, 4 halved potatoes.

Place steak in kettle with boiling water to cover and let it simmer for half an hour. Add vegetables together with salt to the meat and thicken the stock. Place the kettle on an asbestos mat to keep sauce from sticking. Some dried mushrooms soaked and drained improve the flavor. Simmer while making the pastry. Put all in a baking dish with a rolled crust over the top and sides. Brush with milk and bake 40 minutes, covering it with heavy paper as soon as it browns.

EIGHTY-SEVEN EARTHQUAKES 1919

Though the general public may be aware of the fact, the United St usually experiences from 100 to earthquakes each year. This is sh by reports sent to the weather bur United States department of agr ture, from the large number of tions which it maintains in var parts of the country and from its untary cooperators who send in tices of earthquakes observed in t respective localities. The numb disturbances last year was 87, and number reported the previous was 127. A very large proportio these, of course, are so slight as t entirely unnoticed by the public. the Pacific Coast slight earth trem are of sufficient frequency to ca no comment whatever. The majo of quakes reported are from that gion.

One surprising fact, however, sh by the summary of earthquake repo for 1919, which has recently been pared, is that more than a score these disturbances occurred in Mississippi Valley. The region c prising Southern Illinois, Southern diana, Western Kentucky and West Tennessee experienced 20 qua while one was recorded in Northe ern Missouri, two immediately so of Wichita, Kansas, and one in W ington, D. C. Many disturbances the total number reported would h wholly escaped attention but for seismographs, which are so delic that they usually will detect a viol shock, no matter in what part of world it occurs.

FARM HOME CONVENIENCES MEAN EFFICIENCY

The farmer is the only busin man who shelters, clothes and fe his working partners, his wife a children. They not only share in work on the farm but know the amo and kind of working capital and of share in the discussions as to best methods of making the most fr the capital employed, whether in form of livestock or crops.

To get the maximum effort fr these working partners with the m imum expenditure of time, health a energy, it is necessary that they h the greatest degree of comfort in t home. This is to be found in the m ern home where water, light and h lessen labor and add to comfort a restfulness which bring excellent turns in the form of energy and creased vigor—excellent assets in t business of farming.

CHOCOLATE COOKIES

Half cup butter substitute, one c sugar, one egg, two tablespoons mi one-fourth teaspoon salt, two ounc melted chocolate, two and one-h cups flour, one-half teaspoon soda.

Chocolate Coated Walnuts

Coating chocolate, walnut m halves.

Melt coating chocolate over water, being careful that not a drop water gets into chocolate; then b it until cool. Drop in a walnut m half, coat with chocolate, lift out w chocolate dipper or two-tined fo and drop on wax paper or marble s to harden. Continue until suffici walnuts are coated. Cost per pou 70 cents.

THE BLESSED MAN

Blessed is the man, if any, who c get as much satisfaction out of a $1 spading fork and a 79-cent hoe as could out of a $4500 touring car.—O State Journal.

It is beautiful thoughts, even m than beautiful surroundings, t make life what it should be.

Forgive and forget the little tbi that hurt today. An enlarged visi will help you see beyond them t morrow.

We may not be able to be as us or as helpful as we would like, bu fortunately, we are held to accoun for only those things we are able t do.

Buy soap by the box, or by the do lar's worth when it is a leader at special sale, then store it in such way that it will dry out. It will d the same good in washing and wi last considerably longer.

The Cultivator Patterns

BE SURE TO SEND SIZE

3203. **Girls' Dress.** Cut in 4 sizes: 8, 8, 10 nd 12 years. A 10 year size will require ⅞ yards of 27 inch material for the blouse and ⅝ yards for the skirt. Price, 10 cents.

3202-2909. **A Smart Costume.** Waist 3202 cut n 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 2909 cut in 7 sizes: 22, 24, 26, 8, 30, 32 and 34 inches waist measure. To make the entire costume of one material will equire 6⅝ yards of 27 inch material. The width of the skirt at lower edge is about 1⅝ ards. Two separate patterns, 10 cents for each attern. Send 20 cents for both.

3216. **Girls' Dress.** Cut in 4 sizes: 6, 8, 10, nd 12 years. A 10 year size will require 1⅞ ards of 36 inch material for the skirt and 2 ards of 27 inch material for the waist. Price, 0 cents.

3205-3189. **A Trim Business Costume.** Waist 3205 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3189 cut in 7 izes: 24, 26, 28, 30, 32, 34 and 36 inches waist measure. The width of the skirt at lower edge a about 1⅞ yards. It will require 3¾ yards of 38 inch material for the skirt and 4⅛ yards of 27 inch material for the waist. Two separate patterns, 10 cents for each pattern, 20 for both.

3211. **Child's Play Garment.** Cut in 4 sizes: 2, 3, and 4 years. A 4 year size will require 1½ yards of 36 inch material. Price, 10 cents.

3207. **One Piece House Dress.** Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 7½ yards of 27 inch material. The width of the skirt at its lower edge is 2 yards. Price, 10 cents.

2860. **Girl's Dress and Sun Bonnet.** Cut in 5 sizes: 2, 3, 4, 5 and 6 years. Size 4 requires 2½ yards of 36 inch material for the dress and ¾ yard for the bonnet. Price, 10 cents.

2785. **An "Easy to Make" Apron.** Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42 and Extra Large, 44-46 inches bust measure. Size Medium requires 3¾ yards of 38 inch material. Price, 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest **NEW YORK** styles, all patterns ordered are filled in **NEW YORK.** Therefore, we promise to deliver all patterns ordered within **TWO WEEKS:** we guarantee safe delivery of all patterns. THIS WEEK'S PATTERNS

Outdoor clothes for all the feminine portion of the family are shown in this week's patterns.

The little girl's dress 3216 with its round collar and tie, short sleeves and wide kilted skirt has an unmistakable air of class—which simply means that it is of good material, well made and suited to the use to which it is put.

3202-2909 is particularly graceful and becoming and would develop charmingly in any heavy sporting silk weave.

Small sister's gardening togs in 2860 will make her a quite irresistible "sunbonnet girl," and she and the small berompered chap beside her with cooky in hand make you think of the dear little garden beside the house which has a small individual plot for each of these two where they can plant their very own nasturtiums and beans and nice things like that, that will grow even if you do forget to water them just when they get thirsty.

By the way, it isn't too late to plant a little bean wigwam. Kentucky Wonders, with a few scarlet runners for decorations, planted in a circle, staked with poles caught together near the top, will make a darling playhouse in just a very short time.

Aprons, bags and baskets are three of my very special likes, and I never put in one of these pattern columns but I look first to the aprons at the bottom—and they're always worth that first look, and then a second. Note the little outline pattern of apron 2785. Could anything be simpler or more graceful? It hangs without bunchiness and covers the dress well. It shows another feature which is worth noting—the pockets set well forward so that they won't catch on door knobs or other projections as one whisks by.

Now that the house has been gone over and retouched with tint and paint and paper, the natural thing is to draw the sewing machine out before a big window or on the screened porch and make and remake the summer clothes. And here let us repeat a hint given a few weeks ago. If the old sewing machine is out of repair, find some one who can put it in perfect order or trade it in on a new one. Most houses that handle them make a practice of allowing a liberal amount for the old machine turned in on the purchase of the new.—R. P. D.

THE MENDING BASKET AND GOOD JUDGMENT

Classify, or grade, your mending. In the first group place the really good articles that require only a stitch or two or have met with some accidental injury. This shirt is perfectly good and strong except that the shoulder seam is pulled out. It is worth careful repairing. This petticoat with the torn lace should be darned carefully for it is as good as new.

In group two place articles that are beginning to show wear, but will still give considerable service. These are deserving of neat mending, though not such careful work as is desirable on group one.

In group three place such garments as this torn morning dress, the frayed work shirt, and these heavy heelless socks. They are all well worn and thin, yet are too good to be discarded. Run up the tear in the quickest way. Rip off the collar to the work shirt and stitch it back in place with the good side uppermost. Sew patches on the stockings and reserve them to be worn with heavy boots. Mend them the quickest way for their usefulness is limited at the best.

Then there is the question of making over. The advisability of doing this all depends upon the material. Good wool or silk is as worthy of careful making as new material.

This discarded gingham, now; 15 minutes will turn it into a morning petticoat that will wear for several months.

The secret of all successful and sensible mending lies in a wise judgment of your materials. It isn't sensible to spend valuable time mending a garment so thin it will scarcely hold the patches, whereas you are justified in spending a whole afternoon on one good garment that is thereby made as good as new.

Good judgment shows in the mending basket as quickly as anywhere in the house.—A. M. A.

NOTHING BETTER THAN RICE

Personally I think this is true if the rice is cooked thoroughly, otherwise decidedly not. The recipe so often given for boiling briskly in salted water 20 minutes, washing out starch and serving, doesn't appeal to me, for "the way mother used to make it" was this:

Pick over cupful of rice carefully, wash several times in cold water, put to soak at least one hour before cooking. Cook in double boiler in salted water at least one hour, then remove cover and dry out, pouring off a little liquor, if necessary—not washing. Then add milk or cream and a little butter and cook another 20 minutes or more. Serve in hot dish as you would mashed potatoes, with big lump of butter sunk in the middle. This is the old Southern way of using as a vegetable. We seldom saw potatoes on our table—not more than once a month, but we did have plenty of well cooked creamy rice.

The Cultivator gives here a number of combination dishes, using rice as foundation:

Although rice has remarkable food value, it has little individual flavor and so takes on the flavor of the dish with which it is combined. This quality makes rice an excellent foundation for milk and cheese dishes, or combination with meat, chicken and fish in stews. Rice can be combined with any vegetable, made into a variety of desserts, used to thicken soups or mixed with wheat flour or cornmeal in bread making. Even a spoonful left over can be stirred into bread, mixed in chicken or dropped in the soup pot. Left over rice may be browned in fat for breakfast or made into cakes by adding an egg, a little milk, flour to thicken and a teaspoon of baking powder. These rice cakes are delicious with syrup.

Rice Corn Bread

Cooked rice can be used in any corn bread dough. It adds lightness to the bread. From the rice growers of Louisiana comes this recipe for rice corn bread:

3 eggs, 1 pint milk, 1½ cups boiled rice, 1½ cups cornmeal, 2 tablespoons fat, 1 teaspoon salt, 1 teaspoon baking powder.

Beat eggs very light; add milk and other materials; beat hard and bake in shallow greased pan in hot oven.

Rice Hash

Put in pan one cup each of boiled rice, cooked meat cut fine, and hot water. Season with one teaspoon each of salt, Chile pepper and chopped onion. Boil 15 minutes.

Baked Hash or Rice and Meat

Put in a stew pan one cup each of chopped meat, cooked rice and milk; two tablespoons of fat, one teaspoon of salt, one-fourth of a teaspoon of pepper. Stir for one minute, then add one well beaten egg. Turn the hash into a baking dish and bake 20 minutes.

Roast Goose or Duck Stuffing

Four onions, four apples, four leaves each of sage and thyme; fry these in two tablespoons of fat till brown; add boiled rice until of a desired stiffness. Season with salt, pepper and cayenne.

Codfish Balls With Rice

One pint of codfish, two pints of potatoes, one cup of boiled rice, one tablespoon of fat, two beaten eggs, three teaspoons of milk. Mix together and make into balls and fry in deep fat. Serve hot.

Rice Stew

Boil together one can of English peas, one-half cup of rice, one teaspoon of salt, pepper to taste, one tablespoon of fat, and one cup of sweet milk. Thicken with flour. Serve very hot in a hot dish. Cover the top with grated cheese before sending to the table.

IN PRACTICE

The lady whose motor car had run down a man called to see the victim in the hospital.

"You know," she said, "you really must have been walking very carelessly. I am a good driver. I've been driving for seven years."

"You got nothing on me, ma'am,' retorted the man, "I've been walking for 59 years."

Nature never takes any vacation.

HE WAS RIGHT

Mike—What's th' best thing to drown one's sorrows in, Pat?

Pat—Perspiration. Hard work will kill them.

For Plowing and Discing~the Cletrac

Put a Cletrac to work this Spring. It will replace six to eight horses — do more kinds of work — more days a year — save time and cut costs. It will speed up your plowing and discing — allow you to put more acres under cultivation and produce bigger crops.

The Cletrac used alone or in "fleets" is the right size and type for almost every ranch — the one tractor adapted to all conditions.

No difference how soft and slippery the soil is — the Cletrac travels lightly over the surface on its own endless track without sinking in or packing. It is light, surefooted and powerful. The Cletrac "gets" all the corners also, because it can turn short. Swings back to the furrow quickly, without loss of time or power.

In the orchard, too, the Cletrac is at home. Low hung, with no projections, it weaves in and out among trees without injury to them. Use it to move your spray about.

And remember the Cletrac operates perfectly on kerosene, distillate or "gas".

Write today for that interesting booklet, "Selecting Your Tractor" — it's free.

A Dream—Yet True

By J. P. McCutcheon

NO strike seems to be the order of the times, the style or fashion, not from the shoulder, but from the brain, or perhaps more appropriately, nerve. Anyway, it seems that strikes are prevalent in nearly all classes of business or occupation, except among "hayseeds," or farmers. Many different classes of labor are on strike, from the railroad unions down to the chicken pickers union—this latter I believe is the latest and perhaps the least.

But just wait till we stock and agricultural farmers go out on strike!

There will be no chickens on the market to be picked, there will be no railroad men's strikes, as there will be no business for railroads—nothing to haul. The carpenters, the plumbers, machinists and clerks would have no occasion to strike as there would be little or no employment for them. The merchants would have nothing to do after disposing of their present stock of goods.

Bankers could do no business; they would be even worse off than the grocery man who could probably subsist for sometime on his stock by learning not to care for fresh eggs and butter, but the poor banker could hardly exist long on a diet of notes, mortgages and greenbacks, with a little gold for dessert.

It has occurred to me recently that in order to be in the swim and a live member of the striking world, we farmers should organize a mammoth farmers, stock-raisers, agricultural union, and then strike.

The towns will probably say: "How in the name of common sense, or nonsense, has the farmer got a strike coming? The old hayseeds ought to stay home and work." But it's like this: To be in the fashion we will want shorter hours, less work, a better time, and more pay, or else have the city fellow get less profit from our efforts, and get out and work.

You see we farmers work two or three years to raise, for example, a beef animal, and sell it in the town at about eight cents a pound, and the city man skins it, cuts it up and monkeys with it probably 24 hours and sells it again at about 32 cents a pound average.

Now allowing eight cents for cost and another eight for loss in dressing (which eight cents is too much), yet the city man gets twice the money for 24 hours work that the producer gets for his three years work. Could you blame us for striking?

We work with our corn a whole season and sell for about two and one-half cents a pound to the party in the city. He keeps it and abut seeding time sells it back to us at from five to eight cents. (But that of course is our fault.)

Shoes for instance. We of the hayseed class get for our beef hides about 25 cents a pound. I don't know how much the tanner gets, but anyway the leather costs the manufacturer from 90 cents to $1.25 a pound, ready for making into shoes. In a pair of ladies shoes there is not more than one pound of leather, which, with the other material of a pair of shoes would not cost to exceed $2.00, and the lady pays from $10 to $16 a pair, and then some. Somebody makes some money, but not the farmer.

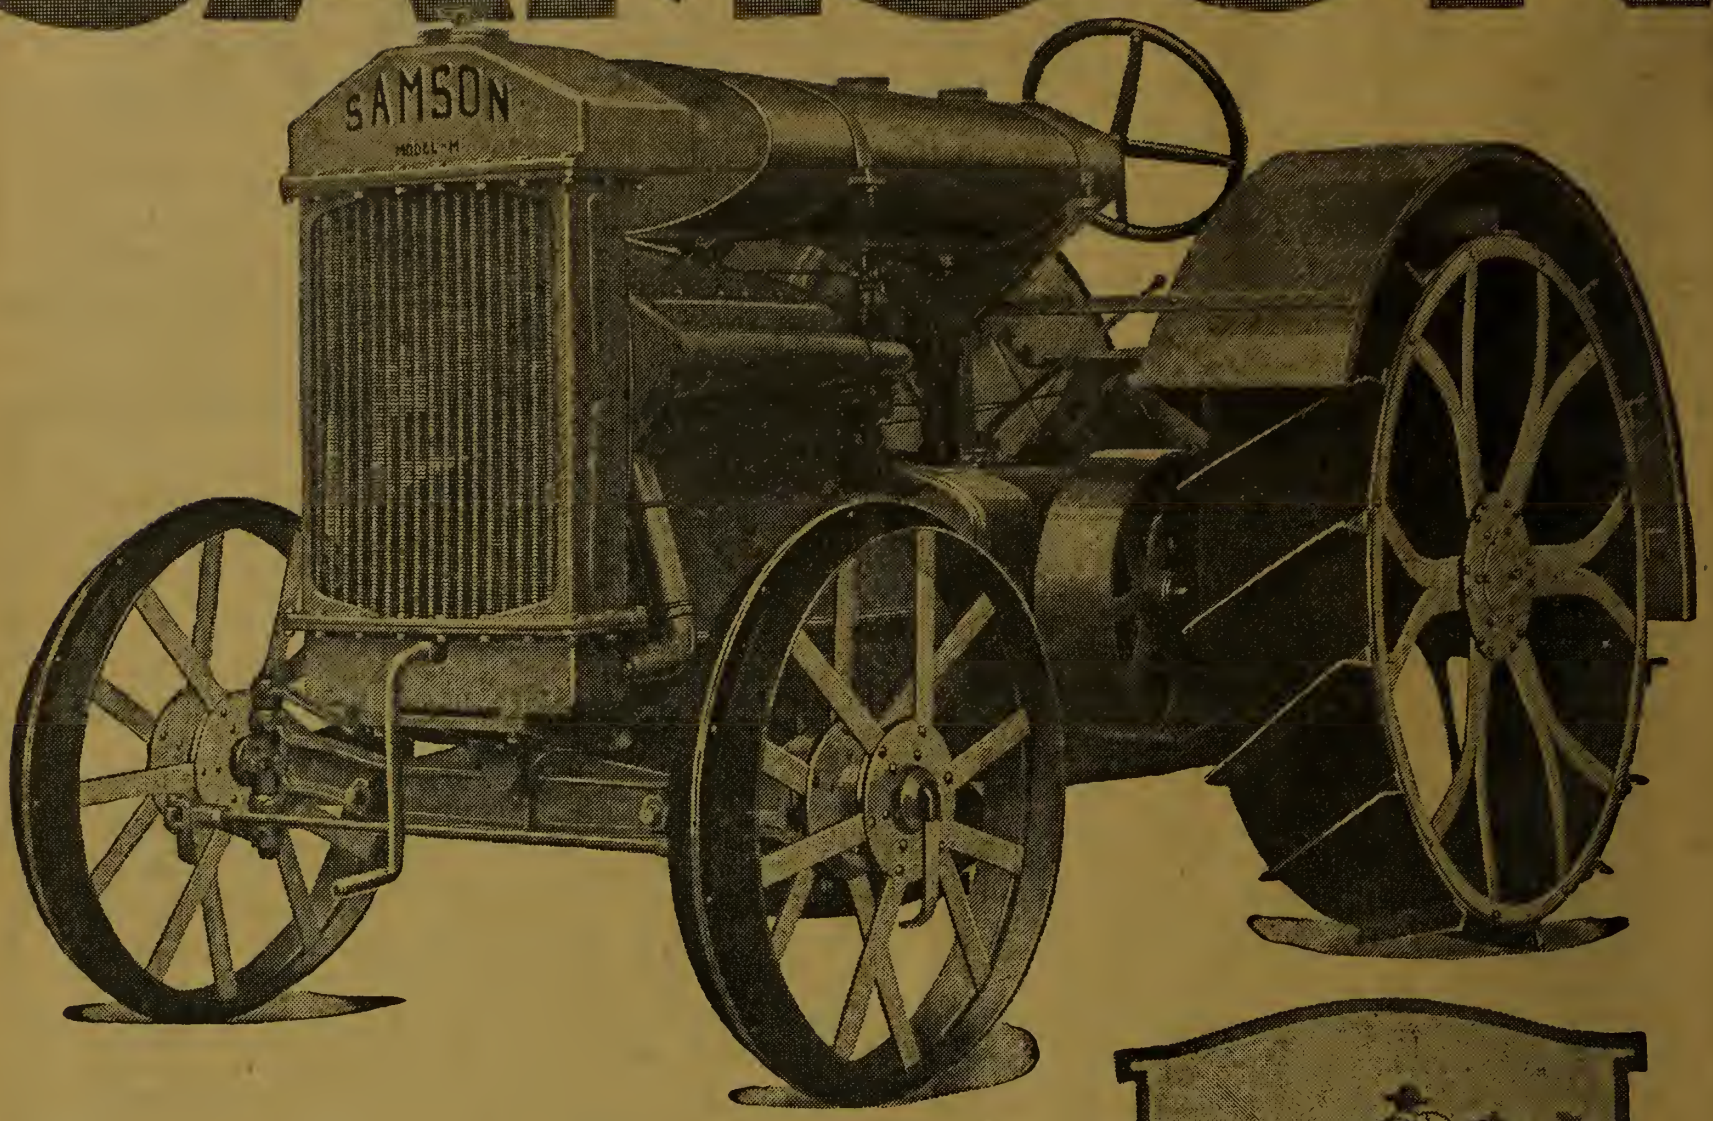
For the cotton in a suit of clothes, say five pounds, the farmer gets possibly $2 for the five pounds, works with it a whole season, and then pays from $20 to $30 for a five pound suit.

Manufacturing, of course, is expensive, but I think that all hands through which the raw material passes get many times more profit than does the farmer—hence our disposition to strike.

We may follow the six pounds of wool entering into a man's suit, from the producer to the wearer, and I think we will find that more money sticks to the fingers at each stage of its transition from the grower to the unlucky guy who pays from $50 to $75 for the suit, rather than dress as they say Adam did in his early days.

This six pounds of wool all cleaned and ready for the factory is worth probably six (Continued on Page 839.)

SAMSON



Heavy Draft Horsepower!

The Final Achievement In a Heavy-Duty Tractor at a Remarkable Price—$840

When the engineers and designers developed the SAMSON Model "M" Tractor, two things were uppermost in their minds: First, plenty of horse power at the draw bar for the lowest possible first cost and upkeep; second, an abundance of reliable, steady belt power that will do every heavy-duty belt power job on the farm or ranch.

They have accomplished both these things to perfection in the SAMSON Model "M." Here is a tractor that will take the place and perform the duty of a barn full of horses, without costing you a fortune or a big part of your crop to buy or maintain.

The even distribution of weight, compact unit design, and low center of gravity, give to the SAMSON great stability, making it hug the ground and preventing all danger of rearing up or tipping over.

The SAMSON Model "M" is the last word in modern, down-to-the-minute tractor construction. It is not like the average I-beam and channel steel frame tractor that weighs so much that it takes a large percentage of its own power for self-propulsion.

It is a close-coupled power unit all by itself, from radiator to rear wheels. Every part is enclosed and protected against dust, mud or rain.

For further details about the wonderful SAMSON Model "M," see your dealer or write us for FREE booklet which contains valuable and surprising information about maintenance cost of the SAMSON compared with horse upkeep.

Cantaloupe Crop in Western States

By F. W. Stillwell, Assistant Truck Crop Specialist, Bureau of Crop Estimates

THE 1920 cantaloupe deal in the Western States will start between May 20 and May 25, when the first carload is expected to roll from Imperial Valley. The principal areas in California, Arizona, New Mexico and Colorado follow one another in regular succession, supplying the United States with cantaloupes from the latter part of May until some time in October. This year the total acreage planted, or expected to be planted, in these four states exceeds the very large crop of 1919 by about 21 per cent. Conditions in the later sections have not developed to a point where it is possible to make definite statements as to the exact acreage planted, but it is believed that a brief review of the situation as it is at present will be of interest to both shippers and growers. The following figures show the relative acreages for 1919 and 1920 in the sections referred to. In each case the acreage of Honey Dews is included. There are very large increases in the acreage in the Imperial Valley and in New Mexico, and the Arizona acreage shows a distinct decrease. The prospective planting for Colorado also indicates an increase in acreage over last year's crop:

California's this year totals 31,350 acres as against 25,560 in 1919. Imperial Valley. 22,500, last year 14,000; Los Angeles and Riverside Counties, 400, last year 1,200; Tulare County, 750, last year 480; San Joaquin Valley (exclusive of Tulare County), 7,250, last year 9,880; Sutter Basin, 450 this year.

Arizona's planting is 2,760 acres, last year 4,600; New Mexico, 2,800, last year 1,330; Colorado, 8,000, last year 5,570; Rocky Ford district, 6,000, last year 4,070; Ordway district, 2,000, last year 1,500.

This makes a grand total for the three states of 44,910 acres as against 37,060 in 1919.

It seems almost certain at the present time that there will be a serious shortage at the time the Imperial Valley crop is moving, and it is not at all improbable that this situation will extend through the movement of the Arizona and Tulare County crops. It is believed that the car situation will be normal, or nearly so, by the time the acreages in the main deal in the San Joaquin Valley, centering at Turlock, and in the Sutter Basin come into bearing.

Briefly, present indications are that the largest total acreage on record will be planted in the Western states. The most serious deterrent factor at the present time is the practical certainty of a car shortage during the Imperial Valley deal and the possibility that this car shortage will continue into some of the deals immediately following. Weather conditions have favored the crop in some sections and injured it in others, but the average for the sections where the plants are above ground is probably about normal at this time. The following comments will serve to outline in more detail the conditions in the various sections:

Imperial Valley

Following is a detailed estimate by shipping points of the acreage of cantaloupes in the Imperial Valley in 1920 and 1919. There is a distinct increase in acreage in the southern portion of the valley, but Brawley still retains its place as the center of the largest growing area: Brawley, 7,185, 6,310; Calexico, 2,026, 482; El Centro, 1,300, —; Grape, 265, 416; Heber, 4,250, 2,055; Imperial, 1,400, 1,154; Kimura, 300, —; Poppy, 600, 843; Rockwood, 900, 631; Westmoreland, 3.850, 2,105, Wilsie Siding, 425, —; total for 1920, 22,500; for 1919, 14,000.

Up to March 1 growing conditions were almost ideal, the weather being slightly warmer than the average for that time of year, with an entire absence of frost. Between 10,000 and 12,000 acres were planted early and the plants covered with oiled paper as a protection against frost. Beginning in March, cold weather, heavy winds and rain combined to retard and injure the crop. There were especially heavy winds between April 5 and April 20. These winds burned the edges of leaves and in many cases shook off the young fruit of the crown set and tore off runners. Because of this damage the season will be delayed slightly and the yield from the crown set seriously reduced. The disturbance of the vines also is causing premature netting, and all factors agree that the crown set will produce a large per cent of "pony" size melons.

In normal seasons growers and shippers figure that the yield for the valley will average about one-half car of cantaloupes per acre. This year, however, because of the unfavorable factors already mentioned, and because growers are relatively or entirely inexperienced in raising cantaloupes, as well as the fact that considerable land not well suited to cantaloupes has been used, it is believed that the yield will be below the average, possibly not over 140 crates per acre. Figuring the average production at the figure named, however, means that 9,345 cars of 336 standard crates each will be produced. Because of strike conditions railroad officials cannot at this time figure at all accurately on the number of refrigerator cars which will be available to move the crop, but many people doubt if over 5,000 cars can be secured for this purpose. An idea of the effect of such a car shortage upon growers and shippers will perhaps be gained by stating that if a maximum of only five crates per day per acre is picked, the supply would fill over 300 cars daily for probably three weeks. Last year's shipments exceeded 300 cars on eight days, and on the peak day 349 cars moved.

The first car this year is expected to move between May 20 and May 25, as compared with May 26 last year. Last year over 100 cars were moving daily on the ninth day after carload shipments began, and during the ten peak days 3,168 cars were shipped out. This concentration of peak load is typical of the Imperial Valley deal, and during the past seven years, with the exception of the unusual season of 1915, approximately 40 per cent of the entire crop has moved out in the ten days of heaviest shipments. It is probable that this will not be true this season, because of the uncertainty of a steady car supply.

The only bright side to the probable car shortage is that with the curtailed shipments higher average prices per crate are expected to prevail throughout the season. There will be the usual cooperative arrangement between the federal bureau of markets and shippers for securing proper distribution of the crop.

Arizona

The usual uncertainties of weather confront the Arizona deal, but at the present time the crop is reported in very fine condition, fields showing about 90 per cent stand of good healthy plants. Some difficulty was encountered in obtaining this stand, as early plantings were injured by various insects, but later planting has brought desired results. The following figures show a division of the Arizona acreage by shipping points: Fair Grounds, 600 acres; Glendale, 565; Phoenix, 600; Gilbert, 380; Mesa, 540; Toltec, 75; total 2,760; for 1919, 4,600; decrease, 1,840 acres, or 40 per cent.

The first car is expected to move about July 1—possibly June 28. It is hoped that conditions on the railroads, in so far as they affect the supply of refrigerator cars, will be nearer normal by that time and shippers generally are not anticipating a severe car shortage for the movement of the Arizona crop. Average production over a series of years is about 180 standard crates per acre.

Tulare County

The 750 acres of cantaloupes planted in Tulare County will be shipped from the following four points, named in the order of their importance: Quail, Zante, Porterville and Lindsay. This is a new deal, but its sponsors are confidently predicting that about 500 cars will be shipped. The shipping season is expected to begin the last week in June, continuing through July. Thus it will be seen that the movement from this section will parallel that from Arizona. It seems probable that because of its geographical location a considerable proportion of this crop will move to the Northwest, but it is known that a portion of it, at least, will be shipped East. This portion will be in direct competition with late Imperial Valley shipments and those from Arizona. There were a few cars shipped from that section last year, and the quality of the fruit was reported as excellent.

San Joaquin Valley

The main deal in the San Joaquin Valley centers at Turlock and is sometimes known as the Turlock deal. There are scattering acreages planted from Madera to Manteca, but the bulk of the acreage is between Ceres and Livingston. It is estimated that in this entire section there will be about 7,250 acres, compared with 9,880 acres last year, a decrease of 23 per cent. There is some uncertainty as to the final acreage because it is not known whether all of the acreage destroyed by heavy winds during the week ending April 17 will be replanted. The destroyed acreage is estimated as approximately 35 per cent of the total planted. Seed is plentiful and local factors are of the opinion that most growers will replant, but it is probable there will be a slight reduction over the original acreage. Heavy frosts the mornings of April 21 and April 22 did some further damage. In general, cool weather has retarded the crop.

The carload shipping season ordinarily opens about July 15 and it is believed that it will open not far from that date this year, although it may be as late as July 25.

It is not possible at this time to make any predictions as to the output from the acreage named, but the average yield over a series of years usually is not far from 200 standard crates per acre. If average conditions prevail this year there should be produced a commercial crop equivalent to 4,315 cars of 336 standard crates each.

Sutter Basin

Cantaloupe growing in this section is a new departure, but those who are interested in the deal believe it will be a big success and that they will get a large yield from the acreage planted. Shipments are expected to start in late July, the movement paralleling that from the main San Joaquin Valley.

Los Angeles and Riverside Counties

Because of limited time it has not been possible for the writer to make a survey of these counties, but it is certain that the acreage will be very considerably reduced, and it is probable that there will not be any appreciable commercial surplus for shipment in carload lots. The acreage estimate for these counties, made earlier in this article, is a very rough approximation.

New Mexico

Encouraged by favorable returns last year, growers and shippers have combined to more than double the acreage planted in 1919. The following estimate shows the 1920 acreage by shipping points: Dona Ana, 630 acres; Las Cruces, 925; La Tuna (Texas), 275; Mesilla Park, 720; Vado, 250; total, 2,800; total 1919, 1,330; increase, 1,470 acres, or 110 per cent.

The writer has not personally visited the section in which this crop is grown, but it is reported that a considerable portion of early plantings was severely damaged or destroyed by a recent heavy frost. It is known that growers are replanting rapidly, and the figures given represent approximately the final expected acreage.

Colorado

Very little planting has been done in Colorado to date, and estimates given are based upon growers' ideas of planting and upon signed contracts between shippers and growers. It is estimated that 6,000 acres will be planted in the Rocky Ford district and 2,000 in the Ordway district, as compared with 4,070 and 1,500 acres, respectively, for 1919. Recently the sugar companies operating in the Rocky Ford and Ordway districts have paid to growers a bonus of $1 per ton upon the 1918-19 sugar beet crop, and it is understood that contracts for the 1920 crop are at advanced prices. It is probable that this action will result in some planting of sugar beets in place of cantaloupes and that the final acreage of the latter crop, therefore, will be slightly less than the figures given.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

SAVE THE MOISTURE

The next two or three months are most trying ones on orchard and, in fact, all crops. Use the dust mulch and in every way take pains to conserve the moisture which mid-summer will demand.

THIN THE FRUIT

The big plums, peaches and apricots command the long prices. Big plums or other fruits cannot be made where the tree is overburdened with fruit and fruit pits. Fruits in some sections have been naturally thinned by frost or other unfortunate circumstance. Where they have not, the wise orchardist will do some patient hand work. It costs time, but it pays.

CITRUS INSTITUTE

June 24 and 25 have been chosen as the dates for the midsummer Citrus Institute. It may he recalled that this organization was perfected at the time of the last National Orange Show, with the announced purpose of holding two institutes annually, the midsummer one to be movable as to date and place, the other to be held at San Bernardino at the time of the National Orange Show. Dr. J. T. Barrett, director of the citrus experiment station at Riverside and president of the Institute, has announced the midsummer meeting to be held in Santa Ana on dates given.

COOPERATING IN WHEAT

Wheat growers of the country recognize that they are up against the would-be profiteer in marketing the coming season's crop. They recently met in Kansas City, at which time delegates from nearly all sections of the Union gathered and discussed marketing and labor conditions. They also protested the action of the United States shipping board in maintaining high and discriminatory rates. Definite steps were taken toward perfecting a permanent organization which it is hoped may be accomplished at a meeting to be held in Washington.

NEW DAM SITE

The northern papers chronicle the news that the reclamation engineers have located a hard rock foundation for masonry for a great dam in the Iron Canyon near the headwaters of the Sacramento. This project has been under way for several years and only last November engineers reported inability to find at reasonable depth a rock foundation. This caused severe disappointment to irrigators of the Sacramento Valley, in fact, to all well wishers of the state. The engineers had not given up, however.

The announcement comes from Secretary W. A. Beard of the Sacramento Valley Development Association, who says that a dam at the new site will impound 643,000 acre feet.

TRADE WHERE YOU LIVE

Trade where you live. The little gray home in the West has added value if it is on the outskirts or within trading distance of a live, attractive little town. A live and attractive little town can only be where there are live tradespeople; live tradespeople will not collect in a community which does the greater part of its trading through the mails with outside of the state concerns. Practically all of the standardized, nationally advertised implements, machines, farm power appliances or farm equipment generally are handled through regular trade channels and the local merchant.

Of course, all this presumes that the local merchant is alive and handling thoroughly dependable, up-to-date stuff. The merchants in some towns may be of the type which induces the farmer to order his implements from far-away centers. In such a case farmers should unite and secure local distribution of modern goods through local cooperative organization, and this in such a way that the profits may go to the upbuilding of the community.

Trade where you live.

ECONOMIZE

The Government Savings Organization of the Twelfth Federal Reserve District quotes the Supreme Council of the Peace Conference in a review of the economic situation as saying that "general wholesale prices have advanced since 1913 approximately: United States, 120 per cent Great Britain, 170; France, Italy and Belgium, each 300. Those, be it remembered, are wholesale prices; retail prices undoubtedly increased to an equal or greater extent." Then follows a most urgent appeal to the people to economize.

This appeal we fully endorse and at the same time feel that we are justified in making a similar appeal to the Government Savings Organization; in fact, to the whole government organization which exists in Washington. The press reports that thousands upon thousands of idle or half idle clerks are still "employed" in Washington. Again, the amount of white paper used np in appeals for economy and in various propaganda from Washington is simply appalling. Editors' waste baskets are filled every morning with appeals for economy and appeals for this, that and the other effort being made by the government.

Perhaps this "educational" material is necessary, but if some of the "overworked" clerks at Washington could be relieved—note we say "relieved"—economy would be really encouraged.

PRODUCTION UP, COSTS DOWN

We have complaint because of the fact that public administrations have not been specially forward in showing economy in the management of public affairs while they were urging greater personal economy. It is a delight to find a real example. Such a one is the farm belonging to Los Angeles County, which is made a home for indigents. This farm is under the direct superintendency of Mr. Harriman, who has been in charge since 1914. The year 1913-1914 showed net cost per capita per day of that institution to be 83.80 cents. The following five years were years of advancing cost, but here are figures of net cost per capita daily as shown by chart which has just been prepared by the administration of the county farm. The year 1914-1915 showed a cut of 59.90 cents per day; 1915-1916, 38.10; 1916-1917, 33.65. The sharp rise in cost prevented any further decline, in fact, compelled a slight rise, and in 1917-1918 showed a per capita cost of 37.03; 1918-1919, an even 43 cents.

Note another feature in the report of this same farm, and this feature causes a very attractive letter "X" on the chart of costs and returns: As noted, this institution is a genuine farm, comprising 400 acres, of which 80 is in river bed and 80 in drives, buildings, corrals, etc. The remainder of the farm brought in a return of $20,785 for 1913-1914; in 1914-1915, $23,246; 1915-1916, $59,261; 1916-1917, $92,072; 1917-1918, $115,567.94; while the gross revenue for last year was $131,700.25. Much of this time the farm has been without a farmer other than that Superintendent Harriman is some farmer himself, as is Mrs. Harriman.

This puts Los Angeles Connty Farm in a class with the most prosperous institutions maintained in California.

DOING CALIFORNIA

It is a genuine pleasure to pilot through the golden poppy fields of California and through its orange, lemon and olive orchards, a hunch of genuine tenderfeet. Three young men from back where they spend millions in hauling snow from the streets, even back beyond Hurricane Land, are now doing California. They are Joseph Payez of New York, Ned Costello and Frank Johns, both of Chicago. They belong on the Cultivator staff and are all engaged in showing to Eastern advertisers the great opportunities offered for the disposal of their wares in prosperous California. These young men are all thoroughly conversant with Eastern conditions, but while they have been busily engaged in securing a wide range of general information as to this state and its opportunities, they wanted that type of information which is more quickly available and gives more punch to their talk in their work of "selling" California. They first came to the Southland; they saw orange trees in bloom and the golden fruit alongside; lemons of all sizes from blossoms to mature fruit in boxes; the handling of walnuts, raisins, dried peaches, almonds and many other of California fruits which are being sent to Eastern consumers.

While they were met at the border with request for information as to how they liked the state, they have withheld the answer, which we will be glad to give later.

FILLING THE FARM LOAN

There seems to be concerted action on the part of powerful interests in a movement to destroy or at least greatly cripple the federal farm loan. The bonds of the federal land banks have been placed on the market and sold quickly. They were most attractive investments because of a fair rate of interest and because of their exemption from taxation. The mortgage companies which for years have had almost complete control of loans on land insist that this has been an unfair competition, hence have taken action to invalidate the federal farm loan enactment, or at least that portion of it pertaining to the bonds. Of course, if the bonds are invalidated or so affected by any supreme court decision that they can only be sold at a higher rate of interest, then the entire law will in effect be nullified.

The matter is on the way to the supreme court, but it is now feared that decision will not be rendered for a year, or at least nine months. Meantime no further applications for loans are being received by the various banks. The bank at Berkeley has made arrangements to borrow sufficient money to complete the loans for which application has been made and loans have been granted. Meantime borrowers will be compelled to look elsewhere unless they are able to await the decision of the supreme court.

The mortgage companies who are making the attack npon this method of securing more economical production frankly admit the competition is too great and they must make the federal farm loan less effective or their own business will suffer.

The federal farm loan has been of great value to many California farmers, though it has not been so popular in this as in other states. The total loans in this district—California, Utah and Nevada—aggregate less than $18 000,000, while loans closed in Texas alone totalled nearly $40,000,000. Those of the seventh and eighth districts—St. Paul and Omaha—aggregate about $47,000,000 each. California orchardists, especially those holding foothill orchards, the site value of which is a great consideration, have felt they were not justly treated in appraisers' valuations. In fact, it has been a rule of the banks to refuse to consider site or productive value when the productive value is so largely influenced by "improvements" or appurtenances such as bearing orchards. This has induced the bank management to refuse loans based on real producing value, and some of California's most highly improved property has been refused loans excepting upon a basis of about half its annual producing capacity. The most that has ever been loaned on any California ranch is $350 per acre, while there are orchards today which have produced several times that annually.

But notwithstanding the direct benefit to this state is not as great as to some others, there is the indirect benefit which comes from the ability of some farmers to secure these loans and pay them off, both principal and interest, at the rate of six per cent. Every farmer, whether borrower or not, should encourage the maintenance of federal land banks.

Bud Selectors Meet With Shippers, Growers and Canners

By M. C. Holman

A RECORD breaking assemblage of shippers of green fruit, canners and growers greeted George H. Hecke when he opened the third meeting of the Nurserymen's Bud Selection Association of California in the senate chamber of the state capitol at Sacramento on the morning of May 6.

In his opening remarks Mr. Hecke pointed to the fact that the Bud Selection Association has a three fold purpose to accomplish. First it is seeking to eliminate the non-commercial varieties of fruit; second, it desires to adopt for propagation only such varieties as have been found to have a commercial value; third, to develop acceptable varieties and to make the trees produce more and better fruit. Having discussed with the canners the selection of the best varieties for their use, and the Prune and Apricot Growers the varieties they wish to retain and improve, the association is now taking up a very important feature of California's fruit industry, that of drying and shipping to the eastern markets, and it is particularly essential, believes the association, that a careful study and analysis be made of present varieties so as to secure the best suited sorts for drying and shipping.

L. B. Scott, manager of the Bud Selection Association and an expert in all lines of the fruit industry, called attention to the main objects of the association. It is the aim of the association to furnish buds of all varieties found through experiments and practice to be commercially profitable. In this way the association renders a great public service. Nurserymen and orchardists can purchase bud wood at cost price and be very sure that they have selections from the best known trees of the varieties selected.

The purposes and ultimate value of the association to the state and the country at large are so fully recognized that it has received liberal support from the University of California and the federal government. There is need at the present time, Mr. Scott pointed out, for careful bud selection in deciduous fruit culture. While congress and the department of agriculture have assisted very materially there has not been sufficient money appropriated to carry on desired experiments, and the association has placed in federal hands the sum of $5,000 annually as a start to securing active government action. A report will be made as to how the money has been spent.

The association is a strictly non-profit corporation and its services are open to any legitimate nurseryman and grower in the state. Too many varieties have clogged the march of progress in horticultural advancement. They have been catalogued and propagated, but many of them were only semi-productive and some proved to be actual drones and totally non-productive.

The organization will aim to learn the locations of highly productive orchards and will study the performance of the orchards as a whole and of the separate trees as individuals. It will also aid in the discovery of the best strains and will from time to time make known its findings. There will be conducted a publicity campaign intended to encourage the individual fruit grower to make a careful study of his trees and help in producing a greater quantity of fruit. It is the aim of the association to keep track of trees and cut the bud wood from those that give a clean record of remarkable production over a period of from seven to 12 years.

J. E. Bergtholdt of Newcastle, vice president of the association, presided at the meeting in the absence of Wil-

(Continued on Page 818.)

Nurserymen's Bud Selection Association of California

By L. B. Scott, General Manager

THE main purpose of the association is to furnish all the buds of all the fruit varieties used by the different nursery firms who are members of the association. In addition buds will be sold to any fruit grower who desires to purchase them for top working. Thus the association operates in two distinct ways as a public service; first, by furnishing to the different nursery members just as superior a type of bud wood as our experts can secure, thus assuring the public a better type of nursery tree when they purchase trees from any firm which is a member of the association and also providing a channel through which reputable orchardists can purchase buds for top working.

Because of this public service idea the association has the hearty cooperation and approval of Mr. Hecke and the state department of agriculture, as is evidenced by this meeting today. It has the approval of the state university, the approval of practical fruit growers, and the cooperation of the federal department of agriculture. The state is releasing from its employ V. W. Hoffman, at present farm adviser of Sacramento County, who will act as assistant manager of the association. Millard Sharpe of Vacaville, recognized authority on deciduous fruit varieties, will have charge of much of our field work.

The association has placed at the disposal of the federal department of agriculture a sum of money to be expended annually in deciduous fruit bud selection investigations. This will make it possible for members of the fruit improvement investigational staff of the United States department of agriculture, who have been working under the direction of A. D. Shamel, in studying the question of bud variations in citrus fruits, to extend their work to other California fruits.

The Nurserymen's Bud Selection Association was conceived by William T. Kirkman, Jr. of Fresno, who is the president. Associated with him are J. E. Bergtholdt of Newcastle, vice-president, and Max Crow of Gilroy, secretary-treasurer. Other directors are George C. Roeding, Fresno; J. M. Barnicott, Newcastle; H. A. Hyde, Watsonville, and J. S. Armstrong, Ontario. The association is a non-profit organization, being operated at cost, and any legitimate nurseryman in the state is eligible for membership. The following leading nurseries constitute its membership: Kirkman Nurseries, Fancher Creek Nurseries, Fresno Nursery Company, McGhee Wholesale Nurseries, California Nursery Company, Silva-Bergtholdt Company, J. W. Barnicott Company, Armstrong Nurseries, Crow's Nurseries, H. A. Hyde Company, Elmer Bros., Ruehl-Wheeler Nursery, Stanislaus Nursery Company.

The commercial activities of the association will be directed (1) along the lines of securing information from the various fruit interests regarding the varieties and percentages of each variety which should be planted and the varieties which should be disregarded. If nothing more than this were accomplished we would feel our work was worth while, as I think we are all agreed that we are cataloging too many varieties of all our fruits; (2) information will be secured regarding the locating of high producing orchards in all the fruit varieties.

We can do very little this year in the actual cutting of bud wood, except to supervise the cutting in a general way. We can, however, sift out the information we obtained regarding the location of desirable orchards of each variety, narrow our selection down to the best trees in these orchards, secure actual records on those trees, and cut our buds from those trees for our own bud farm, so that next year the association can actually furnish all the members all the buds they use of each variety. This will be only a preliminary selection. Better records will be secured next year and a better selection of buds can be made. (3) As soon as the federal investigators determine whether there are distinct strains in each variety, such as has been found to be the case in citrus fruits, which are characterized by differences in the fruit, differences in the leaves or in habit of growth of the trees, we will secure this information from them and we will then secure our bud wood from the best trees in the best strain in each variety. (4) Growers will be urged to secure individual tree performance records so that their trees can be used as sources of bud wood. (5) An accurate track will be kept of the young trees propagated from our selected buds and eventually all our bud wood will come from these second generation selected trees.

The main problem confronting us at the present time is the securing from the various associations interested in California horticulture an expression regarding the varieties of fruits which ought to be developed as the leading sorts.

In April 16 a meeting was held with the representatives of the leading canners of the state, at which an expression was secured regarding the varieties and the percentage of each variety which they preferred for canning purposes. The list follows:

Cling Peaches for Canning

Tuscan 25 per cent, Pelora & Peak's 10 per cent, Albright 5 per cent, Sims & Libbee 10 per cent, Phillips 40 per cent, Levy 5 per cent, McDevitt 5 per cent.

Freestone Canning Peaches

Muir 10 per cent, Lovell 70 per cent, Elberta 10 per cent, Salway 10 per cent.

It was further recommended that the clings should constitute 85 per cent of the peaches canned.

Apricot Varieties

Coast Section: Blenheim 100 per cent.

San Joaquin Valley: Blenheim 100 per cent.

Sacramento Valley: Blenheim 50 per cent, Tilton 50 per cent.

Cherry Varieties

Sweet Varieties: Royal Ann 60 per cent, Gov. Wood & Rockport 20 per cent, Assorted Black 20 per cent.

It was recommended that a small proportion of sour cherries be planted.

At the suggestion of Mr. Eustace of the Curtis Publishing Company, who was present at the meeting and who is familiar with varieties of cherries grown in the eastern states, it was suggested that the Montmorency would be the best sour variety to plant.

Pear Varieties

It was recommended that only the Bartlett be planted for canning.

Plum Varieties

Washington 25 per cent, Yellow Egg 40 per cent, Jefferson 25 per cent, Bavey's Green Gage ten per cent.

It was recommended that not over one twentieth canning plums should be planted as compared with clingstone peaches.

On the 24th of April through the courtesy of the officials of the California Prune and Apricot Growers Association a meeting was held of representative prune and apricot growers. After due discussion they recommended that the following prune varieties be planted:

French 85 per cent, Robe de Sargent five per cent, Imperial five per cent, Sugar five per cent.

The plantings of the last three varieties should be largely in some of the interior valleys, in which they seem to be more profitable than the French.

The apricot varieties recommended were practically the same as those mentioned by the canners, with the exception that in addition to the Blenheim for the coast section it was specified there should be a small planting of Moorpark.

It was brought out in the discussion that the so-called Royal variety is practically identical with the Blenheim, and it was suggested that in future propagation the Royal be discontinued and selected Blenheims be substituted.

We hope at this meeting to get an expression from you regarding the fruit varieties you are interested in.

In conclusion may I say that we appreciate the help we are receiving from the state department of agriculture, from the university, from the federal department, and from the growers, and the word I wish to leave with you is that the Nurserymen's Bud Selection Association is essentially a public service.

Agricultural News Notes of the Pacific Coast

Northern California

Shipments of Black Tartarian cherries began the last of April.

The California Development Board has issued its report for 1919.

Summer session at the university farm, Davis, June 21 to July 31.

The University of California held commencement exercises on May 12.

The Sutter County farm bureau held a picnic on May day in the Sutter Buttes.

Twenty-seven irrigation districts were represented at a meeting held in Oroville May 8.

The Mount Pleasant community of Placer County, held its annual picnic on last Saturday.

Rice growers under the Sutter-Butte Canal Company will now have to pay $20 an acre for ditches.

The dairy department of the Sonoma County farm bureau is considering the advisability of holding hog auctions.

The Sutter County farm bureau holds a big picnic and field meet today. Picnic will be held at Yuba City.

The Weimar and Applegate farm centers of Placer County will hold community picnic at Wolley Flat on May 16.

California rice prices went down approximately two dollars on the hundred last week and heavy sales were reported.

Supervisors of Contra Costa County have awarded contracts for five miles of highway between San Pablo and Richmond.

The heaviest exportation of hops ever made from California was this year's record. Most of these go to European countries.

The San Francisco Produce Exchange has voted to increase its margin on butter two per cent, raising it from six to eight cents.

Cloverdale, Mendocino County, and Santa Rosa, Sonoma County, both made a gala day of May Day with picnics, orations and open air pageants.

At a recent meeting of grape growers at Cloverdale, Sonoma County, 1,200 tons of wine grapes were signed up in the California Grape Growers Exchange.

Horticultural Commissioner Bremner is warning fruit growers of Sonoma County that they must spray in order to prevent serious damage by tent caterpillar.

The wool market is strong and the state farm bureau federation is organizing a cooperative wool selling pool which will enable wool growers to secure fair returns.

Berry growers of Paradise Ridge, Butt County, have formed a berry growers department of the local farm center. They expect soon to form a cooperative marketing association.

At a recent meeting of the Sonoma men's Association at Livermore the subject discussed was fire prevention on range lands of Alameda, San Joaquin, Stanislaus and Santa Clara Counties. Mounted fire patrolmen were appointed.

At a recent meeting of the Sonoma County wool pool committee it was decided to visit growers who wished to pool their wool and decide on a date when the clips should be assembled into carload lots. Each grower's wool will be graded separately and returns made on the basis of quality.

Central California

A new dehydrator is being built at Reedley, Fresno County.

Stevinson, Merced County, is petitioning for an irrigation district.

The Raisin Day celebration at Fresno was the biggest ever held.

Five whales were caught last week at Moss Landing, Monterey County.

The Raisin Day observation was by far the most successful day yet held.

Cotton growers in the vicinity of Bakersfield report some damage from frost.

Sheep shearing sheds at Firebaugh, Fresno County, are a busy place this season.

Official estimate of the attendance at the Raisin Day pageant at Fresno is 150,000.

Six airplanes will be used in making daily fire patrol from Fresno to Bakersfield.

Thomas H. Means has been named chief engineer of the Madera irrigation district.

Plans are being made for increasing the hotel and camping facilities in the Sequoia national park.

Some authorities report that the grain crop of the San Joaquin Valley will be short this season.

One of the hens in the California egg laying contest at Santa Cruz has a record of 30 eggs in 30 days.

The Monterey County horticultural commission now has poisoned barley which it can distribute to growers.

At the recent meeting of the Hillmar farm center hog feeding and milk production were topics of discussion.

Farmers of Gonzales, Monterey County, have formed a cow testing association as a department of the farm bureau.

Selma, Fresno County, is making emphatic protest against speeding, and many an auto driver has been pinched.

At the recent quarterly convention of the Stanislaus County Farmers Union 75 delegates were present from 17 different locals.

Pure bred breeders of Merced County have formed an association to consist of breeders of pure bred animals in all branches of stock raising.

Merced chamber of commerce will make an educational exhibit of its products at the permanent state exposition building in Los Angeles.

The railroad commission has denied application of Kern County farm bureau and board of supervisors of the county for rehearing of the application of power corporation for rate increase.

The Carmel Valley Fruit Growers Association of Monterey County has been incorporated. It will market the fruit crops of members and also act as a buying concern.

The Stanislaus County Farmers Union at its recent quarterly convention at Turlock adopted a resolution urging a boycott against Japanese products in California.

Olive growers in the Lindsay district who are members of the California Olive Growers Association have named A. M. Moss of Lindsay as chairman of the committee to solicit from members funds for a campaign of education to combat the effect of the recent olive scare in the East.

Southern California

Citrus institute will be held at Santa Ana June 24-25.

The hay harvest is proceeding much earlier than usual.

A new cotton gin is being erected at Ripley, Riverside County.

J. G. France is the new county farm adviser of San Diego County.

Apple orchards at Banning, Riverside County, are showing a good setting.

A price of 77 cents per pound for Pale Verde cotton is reported as the record.

The cattle growers of Santa Barbara County held a meeting at Los Alamos on May Day.

Olive growers of Hemet Valley met April 3 to discuss the present marketing situation.

Prof. J. W. Nelson will demonstrate handling of soils at local meetings of the Ventura County farm bureau.

The drainage district at Talbert, Orange County, is to be materially extended or a new district organized.

A bill has been passed by the senate providing for a survey of a general irrigation project in the Imperial Valley.

The Yucaipa apple growers association has paid out to members this week $12,000 as second payment on the Fancy 1 pack.

Fruit growers of Banning, Riverside County, are seriously considering building a cooperative cannery to handle their own fruit.

Oxnard is raising a fund for financing the Ventura County fair. The meeting for making general arrangements will be held May 22.

At a recent meeting of fruit growers of Victor Valley a committee was appointed to draw up some form of organization for a fruit growers association.

There will be 60 per cent of a normal apricot crop this year in the Hemet Valley, according to survey made by Manager Raynor of the California Growers Association cannery.

Coachella Valley announced her first ripe apricots of the season as picked on April 15. The fruit ripened on trees in the government date gardens, in charge of Bruce Drummond. These are said to be the earliest apricots ever ripened in California.

Long staple cotton growers are hoping for a price of at least 60 cents a pound. Sales now being made exceed that figure, but it is thought a materially smaller price will be received for the bulk of the coming crop, though some growers are hoping for $1 per pound.

Dean Hunt, Dr. Harring and Dr. Mead of the state college of agriculture are visiting the citrus experiment station at Riverside. Dr. Harring is to succeed Dr. Webber as director of the agricultural experiment station at Berkeley. He will take up the work on July 1.

Owners of lands about Owens Lake have begun suit against the city of Los Angeles to compel it to cease from diverting waters from the Owens River, maintaining that the diverting of the flow causes Owens Lake to remain at a lower level than it maintained prior to the construction of the aqueduct.

The Coast and General

A Jersey jubilee will be held in Willamette Valley, Oregon.

Colorado reports greater supply of irrigation water than last year same date.

Oregon Cattle and Horse Raisers Association will meet at Burns, Oregon, May 24 and 25.

The department of justice is making investigation of high prices being charged for beet sugar in Utah.

The seasonal flow of the Colorado River will be at least 30 per cent greater this season than normal.

The Mexican cotton boll weevil infested additional acres to the extent of 34,500 in the United States during 1919.

The Philippine Islands report immense sugar output probable for 1920. Estimates are for 225,000 tons for export and 100,000 tons for home use.

The board of commissioners of agriculture and forestry of the Hawaiian Islands have adopted rulings intended to prevent spread of bovine tuberculosis.

Wheat growers of Douglas and Grant Counties, Washington, have been holding a series of meetings in various communities through the first week of May.

The Washington Farmer says: "The real red blooded farmer has his eight hour day, but it is more like eight hours in the forenoon and eight hours in the afternoon."

Dairymen about Seattle called for strike of milk producers, which was averted by distributors agreeing to pay an advance of 44 cents per hundred. The dairymen are now receiving $3.30 per hundred.

Cooperative marketing of the entire cotton crop of the United States is contemplated in a plan being devised by the American Cotton Association which recently met in convention at Montgomery, Alabama.

The sugar beet factory at Fallon, Nevada, will be operated this year. Growers will be paid $15 per ton with an additional $1 for each one cent per pound advance in the price of sugar over 12 cents per pound for refined.

Prof. Robert Stewart of the University of Illinois has been appointed dean of the college of agriculture of the University of Nevada, succeeding C. S. Knight who has become secretary of the Reno Chamber of Commerce.

Washington and Oregon apple growers have investigated as to reasons for not securing larger returns for early winter shipments of apples and find rate of exchange with European countries, especially England, cause for slackening in demand.

Every agricultural organization in the state of Kansas was represented at a farm labor convention held at Hutchinson, May 3. Last year the standard wage was 50 cents an hour for a ten hour day. One community is reported as paying as high as $15 per day with board.

The capitalization of the Southwest Cotton Company, which owns the largest farms of any in Arizona, has been increased to $15,000,000. More land has been purchased and there will be further development. They will soon have 30,000 acres under cultivation and in addition will help to finance about 75,000 acres more

Copyright 1920, by The Goodyear Tire & Rubber Co.

"The use of Goodyear Cord Tires on our dairy farm truck, which runs right through ranches where cattle trample, not only saves hours every day, and not only saves the truck, but also saves the driver—an important consideration. Compared to solid tires, the pneumatics make short cuts in any direction and get over the roads better in any weather."
—George J. Conero, for El Paso Dairy Company, El Paso, Texas

ALL over America there are farmers who, like this Texas dairyman, prefer to use Goodyear Cord Tires on farm trucks for their combination of ability and comfort.

They know that it is as important to conserve the strength and spirits of the man doing the hauling as it is to reduce the hauling labor, time and cost with the big pneumatics.

They note a great difference between rolling along on the pillowy Goodyear Cord Tires and rumbling along on solid tires unfitted for farm work by their hardness and slipperiness.

Toward late afternoon, the farmer who has made his rounds in a Goodyear-Cord-equipped truck feels a great deal fresher than if he had been traveling on solid tires.

All the advantages of the truck pneumatics have their foundation in the strength of Goodyear Cord construction, a result of the skill that protects our good name.

Farmers' own records of what they are saving and making through the use of pneumatic truck tires can be obtained by writing to The Goodyear Tire & Rubber Co., Akron, Ohio.

GOODYEAR
CORD TIRES

Spraying Walnut Aphis

By Ernest Braunton

FARM Adviser Hodgson of Los Angeles County says: "I consider control of the walnut aphis through dry spraying one of the greatest advance steps of recent years in the battle against insect pests. It has opened the way to experiments for control of insects heretofore most baffling and with which we could do little. Among these are the green apple aphis, melon aphis, peach thrip, onion thrips, etc., on all of which dust spray has, during 1919, proved quite effective. We are now looking to its use for the corn ear worm which also injures tomatoes."

These remarks were made at a dust spray demonstration on May 6 in the orchard of B. F. Maxon at West Covina. About 100 walnut growers were present to watch the operations which were declared by those present to be in every way satisfactory. The morning was ideal and at the time dusting commenced, about 9:45, not a zephyr was stirring the leaves.

Ralph E. Smith, formerly for many years with the state college of agriculture, spoke as follows:

Equipment Necessary

"The machine and equipment you see here is the latest and best, differing slightly in some of the equipment from that heretofore used. The machine is of eastern manufacture but the belt, hose and long spout are extras made for this especial purpose and must be purchased separately. The three inch hose, eight feet long, terminates in a long four foot iron sleeve or spout like a three inch stovepipe. Down in Orange County some orchardists are using one eight or ten feet long so it may be thrust up among the higher branches.

"But the only purpose is to cover the tree thoroughly so all the aphis will be killed, the last an easy matter for they quickly succumb to dust sprays and a light dusting only is needed if it be well distributed to all parts of the tree. As the dust is so light that it readily rises special attention should be paid to covering the lower branches and if but one side of the tree is sprayed, be sure it is the windward side. It is best to do this work early in the season for the aphis multiply fast and as they are born alive, not hatched from eggs at this time of the year, they are easy to control if work is thorough. I consider aphis inflict the most serious loss to the walnut grower of any of several troubles that beset him.

Action in Walnut Orchard With Dusting Machine

Note drifting dust fills in background. Spraying is usually done in the morning before the wind comes up, and a large portion of the orchard becomes filled with drifting dust. Photo taken by Cultivator on ranch of T. H. Lambert, El Monte.

Damage Done

"Aphis suck the sap, resulting in reduced vitality of the tree just at the time of greatest development. They make smaller crops, smaller nuts and lighter nuts, less number one's and more culls and these conditions grow worse every year if we have continuous years when aphis are plentiful. It may be necessary to spray but once, but aphis come and go with the weather and in some seasons more than one spraying may be necessary. Do not wait until leaves get yellow and smutty; it is then too late. It is good practice to spray early when aphis are few, so they will not further multiply; so dust in May if season is a normal one. Keep trees free to July and the pest can do no further harm as growth and crops have matured and hot dry weather also retards the activities and increase of aphis. Begin work at daylight and continue until wind interferes."

It appears from consultation with orchard owners that 20 acres is a good day's work, though 35 acres have been covered. The cost is 25 cents a tree for large trees and as there are about 17 trees to the acre this totals $4.25. As a most conservative estimate of average damage each year to the orchard is 100 pounds of nuts, at 25 cents a pound, the investment in spraying is a very profitable one.

For the Worm

As to the dusting for the walnut worm, Prof. Quayle's article in the February "Diamond Brand News" showed the results of last season's work. "The highest percentage found when dust was applied was 10 per cent. Most of the dusted groves were much lower than this, averaging four or five per cent, while some went as low as one or two per cent. The highest percentage found where no dust was applied was 21.9 per cent."

It is also fair to add that the dusted groves were in most cases those that were worst infested with worms, and that, as it was the first season's work, the growers had no definite information as to the best time or methods for applying the dust. With much better knowledge now available, on account of Prof. Quayle's work, it seems only reasonable to expect better results than those of last season, and by using a different form of arsenate this year this dust will not burn tree leaves.

J. E. Lauderdale who has been assistant state entomologist of Arizona with office at Yuma, has been made cotton entomologist for Arizona. His work will be to safeguard the cotton industry of Arizona from boll weevil and boll worm. He will also be expected to devise measures for combating the corn ear worm which attacks cotton.

Stay Out of Trouble

If your engine does lay down it is always at the worst possible time—isn't that true?

Now if you'll think a minute, you'll realize that there is one way you can guard against your gas engine tie-ups—whether it is your stationery engine, automobile, truck or tractor—and that is to get *the most dependable ignition known*—BOSCH!

Bosch High Tension Ignition has been recognized since the beginning of gas engines as the supreme ignition from every viewpoint—dependability—service—economy—power.

You can get the world's most dependable ignition by insisting on Bosch when you buy any kind of a gas engine, or by having the nearest Bosch service station put it on your present engine.

Protect Your Power *Be Satisfied* *Specify Bosch*

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill into the soil 110 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%. Send for Circulars No. 6 and 7.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 degree BE., etc., Fungicides and Insecticides.

Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR CO.
624 California Street, San Francisco, Cal.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET"; also booklet "NEW USES FOR SULPHUR." Price-list and Samples.

Ask us for prices for Carbon Bisulphide, the surest remedy for destroying ground squirrels.

Make Your Valuable Orange Crop Safe From June Drop and Fungus

Are you sure there is no Black or Citricola Scale in your grove, sapping the very life out of the trees that are setting what will be a burdensome crop?

Investigate for your own good. One Black Scale will produce 2000 to 3000 more, quickly spreading to healthy trees. Left alone it retards the growth of the tree and injures the fruit, sometimes lowering the grade considerably.

You can thoroughly clean your trees and eliminate Black and Citricola Scale, Red Spider and Fungus, if you will apply

TIZIT SPRAY

There is a grove near you where TIZIT has done all we claim for it. Send for the name and address of the nearest TIZIT SPRAY user so you can see the results.

The sooner you put TIZIT on, the more work it will do. The genuine TIZIT is labeled TIZIT—Trade Mark Registered.

Folder sent on postcard request.

The Tizit Spray Manufacturing Company

1344 Willows St., Los Angeles, Cal.

Also may be ordered through The Fruit Growers Supply Co.

Westrobac

ADAMS PIPE WORKS

New and second hand pipe and casings. Riveted steel pipe, valves and fittings. Mail orders given prompt attention. Write, phone or call.

2025 Bay St., Los Angeles, Cal.

Displays of fruits, vegetables and cereals were made at the Tracy Land and Auto Show.

GAS TRACTOR SHORT COURSE

If you are an owner, operator, or interested in tractors, you are eligible for enrollment in the gas tractor short course which will be held at the university farm, Davis, from June 1 to 11. This is a practical course designed to give eight hours of information and practice daily to those men who wish to know more about the operation and repair of tractors, or are considering the purchase of a tractor. At least 15 of the more prominent makes of tractors sold in California will be available for instruction. Each tractor will be in charge of a factory representative.

Schedule

Tuesday morning, June 1, will be devoted to enrollment, getting rooms, etc. Lodging and meals may be secured in the University Farm Dormitories and dining hall. The regular instruction work begins at 1:00 p. m. Beginning with June 2, the daily schedule is: 8:00-9:30 lecture demonstration, 9:30-12:00 practice work, 1:00-2:30 lecture demonstration, 2:30-5:00 practice work.

Students are divided into sections of from 12 to 15 upon enrollment. The various sections are then scheduled daily for practice work at definite places, thus preventing congestion and lost time.

Lecture Demonstration Subjects

Gas engine construction, gas engine principles and types, fuels, carburetion, carburetors, ignition, battery and magnetos, governors, cooling systems, lubrication, transmission, clutches, tractor construction, operation, management, tractor plows and hitches, charts, models and tractor parts will be extensively used in these lectures.

Practice Work

Magneto timing, ignition trouble finding, carburetor adjustment, valve timing, babbitting and scraping bearings, soldering, forge practice, motor repairing, inspection and operation of the 15 or more tractors which will be used in connection with the course.

The only charge for the course is a registration fee of $1.00. If you are interested, write to the dean of the university farm school, Davis, California. The course is limited to 180.

BRANCH INSECTARIES

So important has become the necessity for l cal propagation and distribution of beneficial parasitic insects that the state insectary has established branches in several leading counties where, as a rule, they are cared for by the several horticultural commissioners for a small monthly salary. One such insectary is located at Santa Paula, Ventura County, in charge of Commissioner Brock. There is produced the most liberal supply of mealy bugs to feed the parasites that the writer has seen. This is considerably more of a problem than raising the parasites. The latter are Cryptolaemus Montrouzieri, Hyperaspis lateralis and Tanaomastix abnormis, all parasites of the citrus mealy bug. These are liberated only in the worst affected districts and in large numbers, the object being to eliminate the mealy bug by overwhelmingly superior numbers. This gives splendid results in the very orchards where the pest has been the greatest menace, and from these the parasites may easily spread and overcome it in orchards surrounding that are less infested.

STATE SCHOOL LANDS

The state surveyor general at Sacramento informs us that auction sales of state school lands will be held this week and next as follows: Courthouse, Marysville, Yuba County, May 14; Courthouse, Auburn, Placer County, 17; Courthouse, Willows, Glenn County, 24; Courthouse, Colusa, Colusa County, 25; Courthouse, Lakeport, Lake County, May 27. Sales begin at ten o'clock.

You will find it is less easy to uproot faults than to choke them by gaining virtues. Do not think of your faults; still less of other people's faults; in every person that comes near you look for what is good and strong; honor that, imitate it; and your faults will drop off like dead leaves when their time comes.—John Ruskin.

Plant Teague Trees

They Grow and Produce Valuable Crops

We can still supply Valencia Late Oranges, Eureka, Villa Franca and Lisbon Lemons for commercial planting.

AVOCADOS

Good thrifty field grown Fuerte and Sharpless Trees for immediate delivery.

FEIJOAS

Grafted from the best large fruiting varieties.

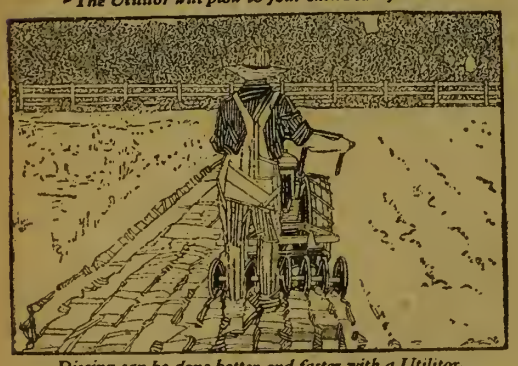
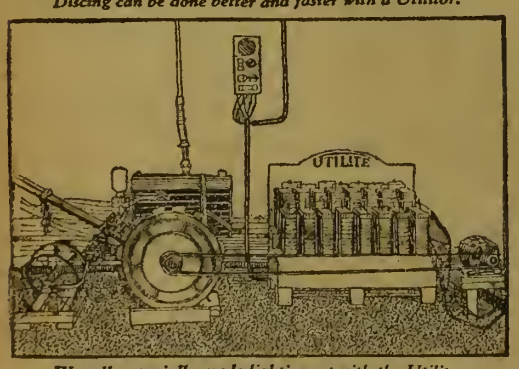
This little booklet will solve your power farming problems. We will gladly send you a copy without the slightest obligation on your part. The coupon brings the book.

Its width makes the Utilitor ideal for cultivation.

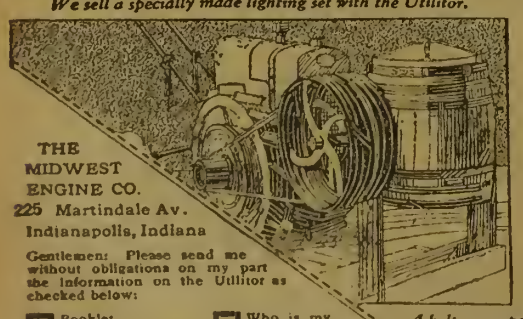
The Utilitor will plow to your entire satisfaction.



Discing can be done better and faster with a Utilitor.



We sell a specially made lighting set with the Utilitor.



A belt use—operating butter churn.

The Farmer Has Got to Take Matters in His Own Hands

—isn't it about time to RUN YOUR OWN FARM in your own way? You've got to cut costs. No matter how much you *get* for what you raise, you *can't make money* if it takes all you make to buy feed for your horses and your hands and to pay wages. Horses and Farm Help will eat, are eating, up your profits faster than you can possibly make them. Find out ALL ABOUT THE

MIDWEST UTILITOR

DEPENDABLE POWER

A Practical Substitute for Horse or Mule Power

Here is our statement that you, yourself can VERIFY:

The Utilitor is a mechanical, handy man and gasoline driven horse COMBINED. It can pull as much as any horse. It plows, harrows, discs, cultivates, hauls—does all the workof one horse.

—and the work of a gasoline engine besides. It will run your pump for filling watering troughs anywhere on the farm, drive a cream separator, churn, cut wood.

Will Work in the Field all Day and Help Light Your House at Night

We have a farm lighting set especially meant to be charged by means of the Utilitor, and this feature, because of its tremendous saving, is of vital interest to you.

You, yourself, will find many new uses for the Utilitor after you get it on your farm.

You Can See a Utilitor Work Before You Buy It

We don't ask you to buy it till you know all about it — who makes it, what it will do on your farm, how quickly you can get spare parts if anything should break, and all the various uses to which it can be put. And the quickest way to get this information is to write for this little FREE booklet, "Beating the Game," which we will send you if you will fill out this coupon. You are not in any way obligated. Fill the coupon out TODAY—NOW.

Dealers Are Selling Utilitors

Farmers, fruit raisers and truck gardeners are buying Utilitors because this machine is a necessity. We want the right dealer representation in open territory. You want active merchandise. The Utilitor is the most active merchandise on the market today. Write or wire us today for our selling plan.

Book Review

PRODUCTIVE SMALL FRUIT CULTURE

"Productive Small Fruit Culture," by F. C. Sears, M. S. Published by J. B. Lippincott, Philadelphia, Pennsylvania.

This book is a discussion of the growing, harvesting and marketing of strawberries, blackberries, currants and grapes. Prof. Sears is professor of pomology, Massachusetts agricultural college, formerly with the Kansas state agricultural college.

From the preface:—"The following discussions on small fruit culture have been drawn from many sources. They have grown in part out of my experience in the department of pomology of the Massachusetts agricultural college and in various other institutions where I have had plantations in charge; they have come partly from work with college classes where such subjects have been under consideration; another and very important part has been drawn from association with the practical fruit growers of the country, than whom there are no better instructors to be found in the world; and a relatively small but very important part has been drawn from personal experience in growing these fruits in my own garden and on my own farm."

The book is made up of 36 chapters touching upon sites, implements, fertilizers, companion crops, cover crops, spraying, soil, harvesting, marketing and many other of the problems confronting the small fruit grower. It is a book invaluable for producer and also of value in school room and laboratory. The end of each chapter usually has ten or a dozen review questions which aid in fixing points made in the preceding chapter.

POISONOUS PLANTS

The jimson weed (properly Jamestown) is a large, coarse, ill scented weed known to nearly every person, east and west, by its large cornucopia or megaphone shaped whitish or purplish flowers. The seeds are very poisonous and often prove fatal when eaten. The species most common in California is not Datura stramonium, but D. meteloides, with a whiter flower, but seeds equally poisonous. Two large shrubby species, D. suaveolens and D. arborea, both known as angels trumpet, are likewise to be avoided.

Even the common poinsettia must not be trifled with, for children have died from sucking the freshly cut stems and gardeners have suffered from getting the juice into cuts on the hands. The well known oleander is poisonous in all its parts. Stock of all kinds have been killed through eating the leaves. They stimulate heart action as does digitalis and have its poisonous qualities. A number of deaths have been recorded in California from eating seeds of the castor oil plant, three seeds having caused the death of a man. Recently in Honolulu a soldier died after eating six seeds. Berries of the black nightshade are made into pies, but eaten when unripe, have caused death. All mentioned are plants common in California.—E. B.

TEN CENT WHEAT

In parts of China wheat is selling today for ten cents a bushel. Transportation is as much a problem in economics as it is in production. For example, in Szechuan, China's great western province, which is larger and more populous than Germany was before the war, many farmers, dependent entirely upon animal or human transport, must put their wheat on purely local markets, where it brings ten cents at a time the world is paying two dollars.

Of course there is no place in this country where conditions are nearly so bad. Nevertheless, we have a very real transportation problem. Ours is a problem resulting from the overworking of one agency of transportation—the railroads—by depending upon that agency to take care of our short as well as our long hauls. And it is a problem that is costly to the consumer, if not to the producer. We must learn that if our power to produce is to grow and benefit both producer and consumer, to any perceptible degree, we must get full value out of all our transportation agencies. In other words we must coordinate the facilities afforded by our railways, our waterways and our highways.

CHINESE SOILS AND CROPS

Most of the soil in the Mukden district is a loose clay loam of brownish color and very deep and fertile. Sandy loams are found in a few places, and on some of the lower levels there is considerable alluvial soil, almost black from the decayed vegetation which evidently thrived in former ages when the land was wholly or partially covered with water. While a good deal of land in the north and northwest is suitable only for grazing, there is very little waste land in other parts of the district.

One authority has stated that no large soil areas of the world contain more potential wealth than those of Manchuria. During most of the year the climate is dry, and while there are extremes in temperature, from about 25 degrees below zero to nearly 100 degrees above, the effect is not as noticeable as it would be in a more humid atmosphere. The rainfall, including snow, is 33 inches, and covers a period of about 70 days, the heaviest rains occurring in July and August. The snowfall is seldom heavy. The rapidity with which crops develop is extraordinary. Spring wheat, for instance, matures in about 100 days, whereas in the same latitude in the United States it requires from 120 to 130 days.

LETTING THE MEN WORK TOGETHER

I never put one man in the field by himself. It's lonesome and he'll either overwork himself or won't do enough. A lonesome man is never satisfied and an overworked man will peg out on you sooner or later. When a man is lonely, it sets him to meditating, and I think that makes him more likely to drag his work than talking to a fellow worker.

I never put two lazy men at work together. I pair them off with good workers and the lazy man will have to come up with his end. Then, too, it shames even the laziest of them to see his partner getting so much more done than he day after day. Last year I had a boy inclined to be lazy. You can't get all industrious ones these days, because there aren't many to select from, but if you use your head you can get work even from some men inclined to loaf. I put this lazy man—he isn't with me now—opposite good men on jobs that required him to keep up or drop out. In plowing corn or turning sod I'd give him the fastest walking team and that helped quite a bit.

There are lots of ways I can get more work out of men when I just keep my eyes open and figure ahead of each job.—System on the Farm.

OUR CHEMICAL INDEPENDENCE

One of the little known by-products of the war has been the advance in the United States of the manufacture of medicines. Once we were obliged to buy most of these supplies abroad, from Germany usually, and, since we had to have them at any price, the Germans charged us outrageously. Some of these chemicals used to cost $70 an ounce, so that a single dose might cost $10. When the supply ceased at the beginning of the war our own chemists set to work to discover the secrets. Years of work followed, but today there is scarcely a chemical product we cannot manufacture for ourselves, and usually at a low price. The medicine which used to cost $10 a dose now costs one dollar.—Boys' Life.

AUTOMOBILE IS KING

America makes nine-tenths of all the automobiles used in the world today. It is only a few years since the best cars were made in Europe but now we send our cars to 183 different countries, including Iceland. It is no wonder that you can scarcely cross a street or road in the country without dodging an automobile, for last year nearly 2,000,000 cars were turned out in the United States, which makes about 7,000,000 cars regularly registered in the country. In a few years it is believed there will be nearly twice as many. There are more cars to the population in Nebraska and Iowa than any other place in the world, or one for every six and a half persons.—Boys' Life.

Keen Kutter Farming Tools for Real Farm Work

Keen Kutter Farming Tools are just the kind of tools that warm the heart of the man who uses them.

Fifty years of actual study and experience has taught us how to make them better than any other line of farming tools on earth.

Perfectly grained, hand picked handles and finely tempered steels are both fashioned to make Keen Kutter Tools look well, serve better and last longer.

The Keen Kutter zig zag tang, welds the handle to metal so firmly that Keen Kutter handles can never come loose.

Your money back if you are not satisfied, is the broad Keen Kutter guarantee.

The Miskin Scraper

IS

THE BEST SCRAPER ON EARTH

And we can prove it. Write for circulars

The above is a cut of the Famous Miskin Scraper, which in operation, easy draft, greater capacity, and better work has many advantages over the common Fresno and wheel scrapers now on the market.

Made in 2-horse, 3-horse and 4-horse sizes. The four horse size can be operated by small tractors from the tractor seat, by the tractor driver.

Send for descriptive circulars, with prices. We pay the freight.

Miskin Scraper Works, Ucon, Idaho

The 1920 Avocado Convention

By Ernest Braunton

THE fifth annual convention of the California Avocado Association on May 7-8 was carried out as per program printed in last week's Cultivator. The attendance was much larger and more enthusiastic than anticipated and the accretions in membership most gratifying. From the 200 of a year ago the list has grown to more than 300 with new members joining en masse during the convention.

The exhibition was the finest ever shown, not only in number of fruits, but in number of varieties, there being 29 named sorts and many bearing registry numbers or placarded "Unnamed Seedling." The range in size and weight was considerable, from unknown seedlings of six ounces up to the Linda of four pounds. While those of green color predominated, many purples were shown, with every shade and hue intervening. Enthusiasm was at high pitch throughout the convention and among the more than 200 attendants at the annual dinner. In fact, the interest shown by the general public was a most gratifying surprise to all and places the avocado industry nearer its proper plane earlier than hoped for by its most enthusiastic supporters. Great things are expected (and assured) for the coming year. The most important paper read to the general public was the report of the committee on registration and classification of varieties, which follows:

Many new varieties, both from seedlings and imported buds, have come into bearing in California during the past year. The committee, since the last annual meeting of the association, has been active every month, and usually many times in the month, in visiting all such trees of which we could learn and sampling the fruit when it was in season and available; and also in striving to obtain the latest information and knowledge of the older kinds which have been recommended by the association for commercial planting.

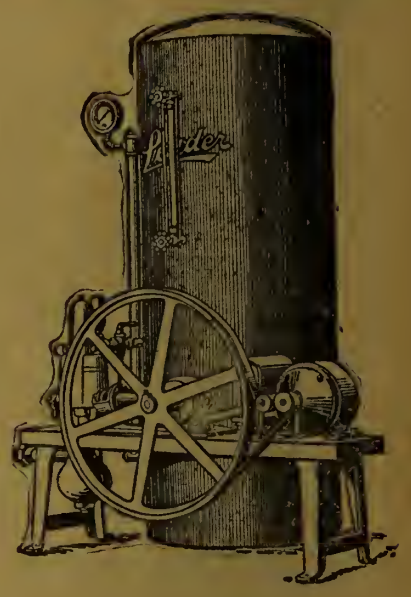
Of the 24 best varieties from the highlands of Guatemala, selected and introduced into the United States by Wilson Popenoe, agricultural explorer of the United States department of agriculture, two have during the past year come into bearing in Florida with a few fruit, the Nimlioh and the Panchoy, enough to prove their identity with the parent tree, hardly more, but enough to permit the department to release the buds for general distribution, which they do not as yet permit except for these two varieties. All are being tested experimentally in California; among them we expect to find some of great value to us here and a number of them are setting fruit to mature during the coming season.

The list of eight varieties recommended for commercial planting, issued October 25, 1917 as Circular No. 1 of the California Avocado Association, embodied the results and conclusions reached after a careful study of the different avocado varieties fruiting in California, made by the committee and by the board of directors of the association.

In a new industry and with our rapidly extending knowledge and experience a critical examination of the list must be made at intervals. Most of our members feel that the time has come to utilize the knowledge and experience which has been obtained during the past three years, and to bring the recommendations of the association into accord with the most advanced knowledge.

The Good Varieties

This association occupies the position of guide and adviser to the men who come into our young industry and plant avocado orchards. With few or no exceptions they will want rapid returns on their investments with as little hindrance and unexpected expense as possible while awaiting crops. We must consider their interests, and as a matter of justice to them we find the Taft, the Lyon and the Blakeman varieties should be dropped from the list of varieties recommended for commercial planting—which we do with regret because the Taft fruit is very fine, one of the very best, and the tree itself beautiful, and one that when it finally does come into bearing will compensate those willing to wait a long time for returns; but it is longer in coming into bearing than the others that have been recommended and more susceptible to frost injury. It is no longer commercially planted. The Lyon is also a good fruit, and the tree remarkably precocious and prolific and best adapted for interplanting, by reason of its slender shape, but it has proved too generally weak and hard



Just turn on the faucet!

Here's the water system for your home. No elevated tank required—no unsightly tower. Supplies running water under pressure all the time—just like a city water department. Put it in the basement or in the barn. Noiseless, automatic pump starts, stops, and oils itself without attention.

to raise. Many trees in many plantlings have died and a decay has developed in some of the fruit while still on the tree. We find this has occurred even in the parent tree. Fortunately these defects do not interfere with the continuance of good prices for the sound fruit from the good crops being given by the good trees nor do they interfere with planting of the trees by those willing to take the risks involved.

The Blakeman is one of the hardier varieties with fruit of desirable size and quality, weight about one pound and seed comparatively small. Some three year old trees are bearing well, and the parent tree is a good and regular bearer. The growth of the tree is too spreading and needs pruning when young to produce a compact, desirable shape in the older tree. Our experience with young budded trees of this variety is limited—too limited, it is felt, to justify its present continuance on the list.

The Races

Of the three races of avocado we know the West Indian to be the most tropical, too tender for California and generally inferior in quality to the Guatemalan which comes from high altitudes in Guatemala and Mexico and finds itself at home in our orchards wherever lemons will do well and be safe to plant. The fruits of the Guatemalan race so surpass the third race, the Mexican, in size, beauty, thickness of skin, freedom from fiber, and shipping qualities, that we have been led, as we suppose, to recommend them alone for commercial planting to the exclusion of the Mexican type which has a distinctive flavor of its own and is more hardy, standing with very many kinds as much cold as an orange and with some seedlings even more. The usual faults with the Mexican type, beside thin skin and very small size, are presence of fiber, anise taste and loose seed in the cavity.

It has been well understood that it was only a question of time before we would find examples of the Mexican type worthy to be recommended for planting, and now we discover we have already in the Puebla, a very high grade Mexican which Wilson Popenoe, after a careful study of the original tree, states positively to be a true Mexican and not a cross or hybrid as we supposed. If we will accept his classification, and he is the one best qualified to know, we have already an excellent variety, with its fine distinctive flavor, in our recommended table, to which we will from time to time find others to add. The Fuerte, also, while predominantly Guatemalan, shows evidence of some Mexican blood.

In the table which follows the names are placed, not according to merit, but in the order in which the fruit begins to ripen, following the calendar year and using Los Angeles as a center. The ripening period varies in different years and in different localities. In San Diego and vicinity they are earlier than those given in the table. Last season in that district Pueblas matured from October 7 to December 24; Dickinsons from March 28 to June 7.

The Fuerte is one of the hardier varieties on the list, one of the most vigorous growing trees, an early and productive bearer, with fruit of the highest quality ripening at a very desirable period, with a greater variation in size and shape of fruit than is usual on the same tree, and with some coming too small.

The Spinks is also a strong growing tree. The large fruit is noted for its handsome appearance and has a long ripening period, lasting from early in the year until October. Some fruit tested in October by Wilson Popenoe was pronounced in a letter written by him, equal in flavor to the best he had found in Guatemala. The committee was also greatly pleased with fruit tested that month, finding it of the highest character; but some tested early in the season, though well colored and of good flavor, proved far from equal to the late fruit. The seed of this variety averages rather large in proportion to the flesh.

The budded trees of the Dickinson are proving better than the parent, both in tree and fruit. An outstanding feature of this fruit is its notably rough, warty skin, which becomes a glossy, handsome purple and identifies the variety. The quality is good and it comes in a period of its own—in the summer.

The Sharpless is well known for its handsome large fruit, comparatively small sced, high quality and very desirable ripening period of fall and early winter. It requires about a year and a half from blossom to maturity.

RECOMMENDED VARIETIES

Varieties	Season Dates	Weight of Fruit in oz.	Weight of Seed	Shape of Fruit	Color of Mature Fruits
Fuerte	Dec. to Apr.	11-16	1.50 to 3.00	Pyriform	Green
Spinks	Mar. to Oct.	16-20	2.00 to 3.50	Obovate to Pyriform	Purplish Black
Dickinson	May to Sept.	14-20	1.50 to 2.50	Pyriform	Dark Purple
Sharpless	Sept. to Jan.	16-20	2.00 to 3.00	Pyriform	Dark Purple
Puebla	Nov. to Jan.	6-14	1.50 to 2.50	Pyriform	Dark Purple

The Puebla tree is one of the best types of the avocado—sturdy, hardy, compact, precocious and productive. The glossy, handsome, pear shaped purple fruit matures at a good season, but is smaller and with thinner skin than the others on the recommended list. The period required from the blossom to the maturity of the fruit is the shortest of any kind on the list, requiring about eight months, and the seed is of medium size.

New Varieties

The Queen and Habersham (Dickey A) are the leaders among the new varieties. But we have only one season's fruit from which to test the first, and a limited experience with young budded trees of each kind.

The Queen is rich in flavor, excellent in quality, and notable in beauty of appearance of the flesh when cut. The tree is of a somewhat spreading growth. The ripening period is early summer; the seed, medium to small for the large fruit; color dark red to dark purple; shape pyriform; a slightly corrugated skin, thick granular and brittle; flesh rich clear yellow changing to beautiful deep green next to skin and with no fiber.

The Habersham or Dickey A: In view of the interest this variety is attracting and the fact that it will be referred to and discussed extensively for the next few years it was thought by the committee that it should have a distinctive name applied to it to avoid confusion. After careful consideration, it was decided to recommend the name "Habersham," and the use of this name for the variety has been approved by the board of directors of the association. The name was selected in honor of Frederick A. Habersham, who planted the seed that produced the variety. According to information secured through John Murrieta of Los Angeles, the seed from which this variety grew was presented to Mr. Habersham by Mr. Murrieta and was planted in 1905 in the location where the original seedling now stands on the place of E. W. Dickey at the head of La Brea Avenue, Hollywood, which was then owned by Mr. Habersham. The variety is hardy, promises well in prolificness and quality of the fruit is extremely good. The weight, 12 to 18 ounces; seed very small, 1½ to 2 ounces; color, red to maroon.

There are also a number of varieties of merit among those tested since our last annual meeting. The notes taken about them have been filed with the secretary and are open for inspection.

Future letters for the committee, or samples by parcels post of fruit for testing should be sent to the Chairman at Upland.—The committee: Chas. D. Adams, chairman, C. F. Kinman, T. U. Barber, Wm. Hertrich.

DECIDUOUS TREE PROBLEMS

Dr. J. C. Whitten will demonstrate pruning and deciduous fruit tree problems for the Los Angeles County farm bureau during the last week of May, at seven ranches in widely separated districts. He will take up summer pruning, thinning and the results of the long system of pruning.

The ranch locations have not all been decided upon yet but will be known next week. On May 24 he will be at Downey; on May 25 at Little Rock and Valyermo; on May 26 at Del Sur and Roosevelt; on May 27, at places of C. B. Sexsmith and J. C. Craig, Owensmouth, in forenoon and at ranches of W. F. Clarke and H. L. Spennett, Van Nuys, in the afternoon.

The United States consul at Nueva Gerona, Isle of Pines, lying about 50 miles south of western Cuba, writes that among the exports during the first quarter of 1920 were 11,698 crates of pomelos, valued at $39,743.; and 529 crates of oranges, valued at $2,101. In addition there were vegetables sent to us valued at more than $12,000. This was a slight increase over our imports from Nueva Gerona of corresponding months in 1919.

Splitting Hairs

A "hair's-breadth" is the ordinary idea of the extreme in fine measurements. But Holt inspectors must literally split hairs, for the rigid Holt standards of accuracy demand exactness to the fractional part of a hair's-breadth.

The story of what Holt standards are, how they are enforced, and what they mean to the purchaser of a "Caterpillar" Tractor, is told in full in a booklet entitled "Accuracy," sent on request to anyone interested in Tractors.

BUD SELECTORS MEET

(Continued from Page 809.)

liam T. Kirkman of Fresno, to whom belongs the honor of originating the idea of carefui bud selection. Mr. Bergthoidt invited attention to the great need for assistance by the grower in the present confusion of types. Many growers, he claimed, selected impossible varieties and those that are totaliy unsuited to the iocalities in which they are to be grown. Many will order dupiicates which bear different names, and some will order second rate varieties when first rate kinds could be had for the same price. Aii of this, being the resuit of ignorance on the part of the purchaser, ieads to dissatisfaction and ioss of both time and money.

In order to get an expression of opinion from the shippers as to what varieties they desired for the eastern market, a questionnaire was sent to all prominent shippers throughout the state, with the request that they rate the vaiue for shipping purposes of the several varieties given. The returns were then tabuiated and presented to those present for their consideration.

Cherries

The first consideration was given to the cherry. The marked similarity between Abundance, Bing and Nonpareil caused the first and last to be eliminated and the three will hereafter be known as the Bing. Early Purpie Guigne, being a poor producer, was unanimously voted eliminated, while Chapman and Burbank were selected as the best early varieties. General Wood is a good cherry for polienization purposes, but not a good shipper, although a fairly good canning variety. Giant was held to be good for the home orchard, but quite unsuited to commercial demands. Black Tartarian was voted a good commercial variety, while Centennial should be planted in the home orchard oniy. Knight's Early Black and Rockport Bigareau were eiiminated as being commerciaiiy unprofitable, while Royal Ann received universal approbation. Montmorency, a sour cherry, was recommended for canning only. Of the 16 varieties formerly catalogued six were eliminated entirely and two were held suitable for the home orchard only.

Shipping Peaches

Mayflower may be pianted as the earliest shipping peach. It has done weii in most plantings, but only a few trees have been set out. It ripens so eariy as often to be ready to ship with Lambert Cherry. Alexander is aiso an eariy variety but does not do weii in aii sections. Hale's Early fiiis the gap between the early and iater peaches and is considered a suitabie commercial variety. Early Crawford and Foster are so nearly alike that the name Foster was ordered eiiminated and hereafter peaches of that variety will be known as Early Crawford. But Foster is a particuiarly good peach and should be cultivated for Eariy Crawford, thus taking a more popular name. Early Eiberta and Elberta were recommended as good shippers. J. H. Hale will prove a good bearer, while Late Crawford will not prove as good a bearer, but is a better peach. It was, however, eliminated from the commercial standpoint. Hale has been a heavy bearer in Glenn and Piacer Counties and ripens with Elberta, which it very closeiy resembies. Decker has proven a good shipper and may be sold in England and France. Morris White may be retained for the home orchard but it has been found to be a poor shipper. Triumph is an early commercial variety which has strong shipping quaiities. Salway received recommendation for continuation as a late freestone and Strawberry Freestone was recommended for the home orchard. What was known formerly as Yeiiow Saint John will hereafter be known as Saint John, the yellow having been ordered eliminated. Of the 33 varieties formerly cataiogued and causing great confusion, 20 were ordered eliminated and two were found suitable for the home orchard oniy. Where two varieties showed a strong similarity they were combined, thus eiiminating one variety. Only those of known value were retained.

Drying and Canning Freestones

The recommendations of the canners were adopted as foiiows: Lovell 70 per cent, Muir, Elberta and Salway, ten per cent. This gives these peaches a similar shipping value. Of the former nine varieties of drying and canning peaches oniy the four above named will be recommended as good shipping varieties, the other five having been eliminated. For drying, the Loveil was given a 25 per cent rating and the Muir 75 per cent.

Canning Clingstone Peaches

In the estimation of the canners 85 per cent of the peaches grown for canning should be clings and 15 per cent freestones. The recommendation of the canners as to varieties was adopted by the shippers, giving the selections as follows: Tuscan 25 per cent, Pelora and Peak's ten per cent, Albright five per cent, Sims and Libbee ten per cent, Phiiiips 40 per cent, Levi five per cent for Placer County, McDevitt five per cent. Of the 16 varieties formerly cataiogued seven were eliminated. While the Phillips received the largest percentage value it was held that this peach could be improved by proper selection. The Peak's and Pelora are very similar to the House and Johnson, but better shippers. The House and Johnson were formerly eliminated except for Sutter County.

Nectarines

The nectarine is a much neglected fruit. America does not appreciate its value, while it is much prized in Belgium and Engiand where it brings fancy prices. It can be grown better in California than eisewhere and a general effort shouid be made to establish its popularity. The shippers are now calling for a good red variety in limited quantity.

Stanwick is the largest of the nectarines and thrives splendidly in Fresno County. It has proven to be the best shipping and drying variety. High prices are paid for the red variety, whiie the white and yeiiow go to the cheaper trade. Gower is particulariy good for shipping. It is an oid Engiish variety and is a heavy bearer Humboldt was advocated for the home orchard and is a good bearer. Of the former nine varieties aii were eliminated except Stanwick and the Gower for commerciai purposes and Humboidt and New White for the home orchard.

Shipping Plums

Anita bids fair to become one of the best of the iate summer varieties While it is new to Caiifornia it has shown itseif ahead of Wickson and is a heavy bearer. It can be dried as a prune.

Beauty is a big favorite with the shippers, but the grower must use care in the selection of his trees. California Biue is a good shipper and a strong seiier. It comes at a season when a biue pium is desirabie and

CHAMPION TRADE MARK

Champion
Dependable Spark Plugs

80% Tractor Equipment

WORKING under full load ten to twelve hours at a stretch, the tractor gives spark plugs their most severe test. It means sustained power and terrific engine heat.

Champion Spark Plugs with their famous No. 3450 Insulators are so universally recognized as the plugs best adapted to fit these unusual conditions of shock, heat and temperature changes that they have been chosen as factory equipment on 80% of all the tractors being built today.

There is a Champion Spark Plug for every type of motor car, truck, tractor, motorcycle and stationary engine. Order a set from your dealer today.

Be sure the name Champion is on the Insulator and the World Trade Mark on the Box

Champion Spark Plug Company
Toledo, Ohio

finds a ready market. Gaviota makes a good pitted plum and is inclined to be a good bearer. Dawson is a good preserving variety, but small and does not show a big commercial demand. It is well suited to the home orchard.

Giant has not enjoyed much favor in the eastern market, although it is a heavy producer. On the other hand Hungarian is a much better plum, although a much poorer producer. Satsuma may find a suitable berth in the home orchard, but it lacks as a shipping favorite. Duarte is a plum of pleasing appearance and a good bearer, making it one of the favorites with the canner and shipper. Becky Smith, practically new, has been found to be a good bearer and a suitable shipper. It bids fair to become one of California's leading varieties. Of the other varieties that were advocated to be retained were Burbank, Climax, Diamond, Grand Duke. Kelsey, President, Santa Rosa, Tragedy and Wickson. Of the 28 original varieties nine were eliminated and three were recommended for the home orchard.

Canning Plums

Of the canning plums the shippers adopted the recommendations of the canners, as follows: Washington 25 per cent, Yellow Egg 40 per cent, Jefferson 25 per cent, and Bavey's Greengage ten per cent. Of the canning plums suitable for shipping only the Imperial Gage was eliminated.

Apricots

The shippers also found it desirable to recommend the same as did the canners with the addition of a few Moorpark, which were suggested for drying. The apricot recommendations were as follows: For the coast, Blenheim 100 per cent, for the interior San Joaquin Valley, Tilton 100 per cent, for the interior, Sacramento Valley 50 per cent Blenheim and 50 per cent Tilton. Routier's Peach was eliminated except for the home orchard. Of the nine varieties of apricots heretofore listed, five were eliminated. Royal was advocated for small plantings.

Drying Prunes

French prune received a 70 per cent recommendation, while the Imperial, Robe de Sergeant and Sugar received ten per cent. Standard, Conquest and Silver were recommended to be eliminated.

Pears

A large proportion of the varieties of pears was found to be desirable commercial varieties on account of their shipping qualities and the general demand in the eastern markets. Bartlett is always a strong favorite and should be liberally planted. Beurre Hardy is a prolific bearer and a splendid shipper. Comice is recommended only as a home orchard pear as it is a shy bearer. Its quality is good and it would be one of the strong favorites if it could be made a greater producer. Eastern Beurre differs as to localities, sometimes being a heavy bearer while in other localities it will be a very light bearer. Forelle has generally produced good results and brings high prices in the Northwest. It has splendid keeping qualities and is a good canner. Glout Morceau is strongly advocated for coast planting as it has shown well in that locality.

On account of the fact that it comes into competition with the eastern pear of the same name Howell is not recommended as a shipping pear, although it is of pleasing quality and a prolific bearer. Winter Seckel is a good bearer, especially in Santa Clara Valley. It keeps well in storage, but is subject to blight. This pear would stand development, but was eliminated for the present except for the home orchard.

Of the 19 varieties formerly catalogued seven were eliminated.

Persimmons

There is much confusion as to this fruit. There are six varieties generally grown, but they may be planted according to the time of ripening. The three recommended varieties are Tane-Nashi, Hachiya and Hyakume. These ripen in the order named.

Quinces

Of the quinces all were eliminated except Pineapple and Van Deman as commercial varieties. Smyrna may be retained for the home orchard but lacks in desirable shipping qualities. Of the six varieties heretofore enumerated only the above two for commercial growing and the one for the home orchard were recommended.

That the Bud Selection Association is meeting with success needs no affirmation. Each meeting has been better attended than the former one. A future meeting will be held with the Apple Growers' Association and the Almond Growers. Dates will be announced later.

The association is desirous of enlisting the cooperation of growers throughout California and asks information as to the orchards that are producing well. The names and locations of such orchards should be sent to L. B. Scott, Theatre Building, San Jose, headquarters of the association. A careful study will be begun upon the selected orchards with a view to securing bud wood from the best producing trees.

Members of the farm bureaus of Stanislaus, Merced, and Madera Counties met recently at Merced to discuss the organization of a tri-county marketing association to be connected with the state farm bureau marketing association.

INFLUENCE OF CITRUS STOCKS

Tests were made by Dr. H J. Weber at the Riverside citrus station of large, intermediate and small sized nursery trees upon which were budded Navel and Valencia oranges and the Marsh Seedless grapefruit. At the time the buds were 4.5 years old and the trees had been planted 2.5 years in the orchard the differences in size of the stocks were of the same nature as when the trees were dug from the nursery. The large trees remained large and the small trees remained small. A study of the reasons for this condition indicates that it is caused by the different character of the seedlings on which the trees are budded. Many widely different types of seedlings were observed, and it was found that some are much more vigorous growers than others. It is pointed out that promiscuous budding on stocks of such variable type is responsible for much of the variability in size and production of trees in California groves.

Nevada County held its annual farm bureau picnic at Grass Valley on May 7.

HUDSON SUPER SIX

Hudson is Best Known For Its Super-Six Motor

Official Proofs Established Its Supremacy; Thus Hudson Became the Largest Selling Fine Car

Few of the 90,000 Super-Six owners have ever tried the limit of Hudson speed or power. They realize they have a vast reservoir of ability that is never called on.

Yet no one mistakes it for mere idle surplus simply because it is beyond his ordinary requirements.

For that latent capacity is Hudson's greatest value. It is the life of a car. Because of it, thousands are now getting the fullest satisfaction and service from Super-Sixes nearly five years old. They know the durability it gives. They know what it means in smooth operation. Their cars have required neither costly replacements nor constant attention to minor disorders.

Moreover, it is good to know that you have at instant call greater speed, acceleration and hill-climbing ability than any other stock car has ever shown.

80% More Efficient— Within 10% of Perfect

Many have called the Super-Six "the perfect motor." That, of course, is not accurate. Perfection would mean utter freedom from friction and vibration. No machine can ever be that. But the Super-Six comes within 10% of it. Could another type approach that close Hudson's records might be matched. But for nearly five years they have stood. None has equalled them. The possibility of their being rivalled seemed never more remote than now. Certainly the type to do it has not yet appeared.

And mark this important fact. Hudson's supremacy means no added complications, weight or size. The patented Super-Six principle applied to a standard type of motor added 72% to power. Motor efficiency is increased 80%. Endurance thus has been increased to limits yet unknown.

Note These Tests Made To Prove Its Endurance

Think that a Super-Six stock chassis set the speed record at the rate of 102.53 miles per hour. A stock Super-Six holds the acceleration record. And Hudson made the fastest time for the famous Pike's Peak hill climb. The Super-Six principle in speedway-racing won more points than any racing team ever took, in a single year. And think of Hudson's double trans-continental run of 7,000 miles in 10 days 21 hours. No other car ever equalled its time in either direction.

Those tests speak for Hudson endurance —the real reason for its appeal to you today. There can be no question regarding its beauty, its completeness, its fineness—advantages patent to any observer.

You will best assure delivery when you want it by speaking for your Hudson now.

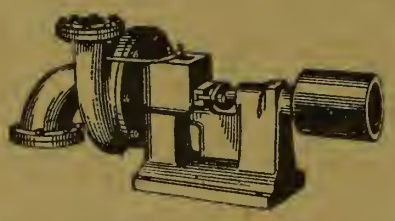
End Pump Troubles



—See how this Pump does it.

THE "Bean" Universal Pump—belt driven—eliminates pump troubles. It's a twenty-year development, the ultimate in centrifugal design.

Stuffing box troubles are minimized by a perfect water seal. The shaft where it enters the case is ever completely surrounded by a water bath.

The danger of loss of priming is minimized. And you don't have to cinch the packing down so tight that you cut the shaft.

We designed this pump especially to overcome these trouble sources.

Then we added all the other advantages in pumps that our experience of 20 years evolved.

The result is the perfect pump. Don't overlook it in making your selection.

Hundreds of men who have examined all kinds are putting in the "Bean." Let their decision guide you.

(Clip Out and Mail)

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway. Los Angeles.

Damage from Trees

Is there any fixed distance that trees must be planted from the line fence or property boundary? Can a land owner request the removal of a hedge 25 feet high and only two or three feet from his neighbor's land line?—Subscriber, Solvang.

There is no fixed rule with respect to the distance at which trees must be planted from a line, nor to actions to remove such trees. The principle at the basis of cases involving removal of trees is that trees constitute a nuisance, and it is necessary to show that the parties seeking removal of such trees have in some wise been caused actual injury by intrusion of the roots or branches.

Water Right

A stream runs through our ranch and onto a neighbor's The neighbor goes onto our property, builds a dam and takes out the water to irrigate his property. This has continued for some three years last past. If we permit him to continue so to take this water will he acquire a right thereto? Is it necessary that we put in a pump and take the water out of his dam in order to prevent him from acquiring such right? There are times when we need every drop of water in the creek for ourselves.—Subscriber, Paicines.

It is probable that if the party builds a dam and takes water from your premises for a period of five years he would acquire a prescriptive title or easement upon this property, entitling him so to do forever. If you should pump the water out of his dam that might cause trouble. You can, however, prevent him from trespassing upon your property and cut off his irrigation works which have been placed upon your property. It is necessary in order that such person should not acquire title by prescription that the owner of the land assert his right in the matter. You can do this either by barring him from your land or bringing action for the trespass.

Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Cutworms

Let me know what is needed for cut worms.—Subscriber, St. Helena.

The best answer to the above question is to reprint from the California Cultivator of May 24, 1919, from the item written hy Mr. de Ong, the following:

Poisoned bran bait is most effective when they are abundant. For small areas mix four pounds of wheat hran, three ounces of white arsenic, one pint of strong molasses and about three quarts of water or enough to form a crumbly mass. This bait may he scattered around the plants where the cutworms have been feeding or, hetter still, hroadcasted over the plot before planting. Dried lumps of the bait should he gathered and destroyed as this is dangerous to poultry and other animals. Fresh, green alfalfa dipped in a solution of arsenic, one ounce to five gallons of water, has given good results when scattered about the garden after night. Finely sliced raw potato dipped in the powdered arsenic is also of value.

Lice or Aphis on Kale

What kind of spray can be used on kale plants to kill lice and not be poisonous for chickens?—Subscriber, Marysville.

Lice or aphis are comparatively easily controlled with a mixture of kaolin, hydrated lime and nicotine sulphate. This mixture is now supplied as a regular commercial mixture. It would probably be best to secure only a small quantity if you do not have a large garden. We douht not that simply dusting tobacco dust over the plants would he sufficient.

Ants

Would like information on how to rid my apricot trees of tiny black ants?—Subscriber, Mountain View.

The best control of ants is to follow the trail to their home and pour in boiling water, gasoline, carbon bisulphide, or a solution of cyanide of sodium. The California Cultivator of August 9, 1919, shows method of placing poison in small containers on trunk of tree in which ant syrup made according to the formula of Prof. R. S. Woglum, was placed. This formula is now generally recognized as a standard for this pest, and is made as follows: Prepare a syrup of granulated sugar, 15 pounds, water seven pints. tartaric acid (crystalized) one-fourth ounce, boil for 30 minutes. Allow to cool. Dissolve sodium arsenite (chemically pure) three-fourths ounce in one pint hot water. Cool. Add poison solution to syrup and stir well. Add to poison syrup, honey, one and one-half pounds, then mix thoroughly. Distribute as suggested above or in any container which will admit the ants and at same time not endanger children or pet stock.

Los Angeles, Cal.

Green Feed for Livestock

ONE of most important factors in the production of livestock is an abundance of green feed. The livestock producer's idea of paradise is a country where he can have the advantage of green feed the year around—and yet in California, where it is more nearly possible to produce green feed 12 months in the year than any other section, hundreds of men are failing to take advantage of that possibility.

The writer is quite aware that, speaking in a large way, it is neither practical nor advisable to attempt to produce green feed on the major portion of the California ranges, and it is not his intention to suggest as much. But each year about this time he is impressed with the lack of effort on the part of hundreds of livestock men who are so situated that they could, with little effort escape the nightmare of dry feed, to provide green pastures for their stock.

The entire problem of green crops is one of water. With water and proper crops it is possible to have green forage every month in the year. There are men in this state, operating irrigated farms and who are engaged in livestock production who are attempting to raise cattle and hogs in dry lots.

It is perfectly possible to grow livestock in dry lots, but it is impossible to grow as good cattle and hogs under such conditions as where green feed is provided.

One of the first expressions of wonder heard from visiting livestock men of the East is: "But why in the name of heaven don't you people have green pastures? You have the soil, the climate and with water can grow the best forage in the world, alfalfa."

What is the answer? There are not many sensible answers.

Some men feel that they cannot afford to utilize high priced land for pasture. They believe it more profitable to keep their stock in lots and cut hay for the cattle and buy grain and mill feeds for the hogs. Under some conditions such may be the case, but in the majority of cases it is more economical to use pasture. With properly arranged fields, under irrigation and producing alfalfa it is astonishing how many head of stock can be carried. The saving of labor in cutting, hauling and feeding hay, together with the loss in feeding as compared to a system based on pasture is in favor of the latter practice. Properly managed, there is little or no loss of feed when pastured, besides it is a fact that livestock thrives better on green and succulent forage than on cured fodder. Young things in particular do better on pasture. They get vastly more exercise and soon grow away from dry lot stock.

Since the beginning of time, those sections of abundant green forage have been responsible for the highest quality of livestock. That fact is too generally admitted to require further proof. It has been true in the past. It is true at present and will continue to hold true in the future. We have been told time and again, that this state has a brilliant future as a source of the highest type of livestock. We are beginning to believe it, indeed some of us are getting a bit chesty and cocky over the proposition, but we might just as well realize now as later that if we are to become really great as a livestock center, we can not ignore the fundamental principles that govern livestock production—one of the most important of which is the need of green forage.—R. P. R.

Well Equipped Stock Ranch

When the Diamond Bar Ranch at Spadra determined upon launching the big livestock breeding enterprise, which they now have so thoroughly well in hand, it was the high purpose of the management to make the enterprise one whose magnitude and high character should be in keeping with the splendid environment.

The breeding of high class registered Duroc-Jersey swine was settled upon as one feature of the Diamond Bar livestock breeding activities, and it is of this alone that we make mention at this time.

Labor Saving in Hog Feeding
Self feeder cafeteria style on Diamond Bar Ranch.

An outstanding feature of last year's achievements at the ranch was the securing of the great show boar and sire, the Ace of Pathfinders, whose record as a sire of show ring animals constitutes one of the leading triumphs of modern show yard history. As running mates for so eminent a sire there have been secured such great sows as Queen of Pathfinders, Model M. and Lucy Pathfinder and many others of grand champion and first prize show yard caliber, as demonstrated in the most hotly contested shows open to the breed. Likewise, every noted family of the breed is represented at Diamond Bar. The 1920 spring litters are the get of such popular sires as Great Orion Sensation, Great I Am, Royal Pathfinder, High Pathfinder, Uneeda Great Sensation, Top Orion, Mammoth Sensation, Jr., Great Pathfinder, Great Sensation 2nd and California Great Wonder.

A visit to Diamond Bar ranch should be at once an inspiration and revelation for any progressive hog breeder of whatever persuasion—and the latchstring is always out.

BOYS AG. CLUB HOG SALE

The Kern County High School Ag. Club holds on Saturday of this week a pure bred hog sale which will doubtless establish a record in agricultural club activities. There will be mature brood sows, young boars, open gilts and weaned pigs. The boys are to give free lunch at 11:30, followed immediately by the sale, which will be on the Kern County fair grounds at Bakersfield. As an advertisement for this event the boys have issued a magnificent 76 page booklet, "The Cost of Raising a Pig to Weaning," which contains information written by the boys and by experts in swine breeding. The figures which go to make the most interesting contents of the book show the result of some 30 different litters' records. The three breeds used by the boys are: Poland China, Duroc and Berkshire.

Suit to dissolve the Northern California Milk Producers Association is now being tried before Judge Shields at Sacramento.

The state highway between Chico and San Francisco will be open for use July 1.

Turn Low Priced

Agri GYPSUM

Into High Priced Alfalfa

Bigger yields and better crops follow applications containing high sulphur content

Turning grass, hay or other feed into beef is a process known to all stockmen. The process of feeding elements that contain sulphur to a sulphur consuming plant like alfalfa, should be familiar to every grower.

The Oregon Experiment Station, and many others, have conducted tests proving that Gypsum is highly beneficial to alfalfa and the splendid results showing increases in production, in Bulletin No. 163, are among the best evidences ever authentically made public, proving what Gypsum will do.

Alfalfa requires a high percentage of sulphur to develop luxuriant growth that grades high and feeds well. AGRI GYPSUM contains sulphur, in the form of sulphates, which is the form directly available for crops, and not only supplies the element needed most, but it releases bound up elements in the soil, making them available as plant foods.

A maximum crop of alfalfa requires 45.9 pounds of sulphur per acre per year which gypsum supplies.

Give your alfalfa AGRI GYPSUM. You can reasonably expect a return much greater than the investment, and the application will be beneficial to the soil for more than one season.

Other crops greatly benefited by an application of AGRI GYPSUM include beets, beans, peas, potatoes, cotton, cabbage, cauliflower, cantaloupes, vetch, melilotus, barley, citrus, deciduous fruits and milo.

Be sure and ask for AGRI GYPSUM, which is ground fine to do the most good. If your dealer cannot supply you, write,

BURR FARM

Box 220, Route 2. East 26th and Downey Road, Los Angeles

The De Laval Milker

—it pleases the cow

Used on Breidablik Farm, Wilmington, Delaware

The De Laval Milker is in constant use on Breidablik Farm, milking sixty high-grade Guernsey cows daily.

Naturally a farm with high-producing cows (ten of them average over 10,000 pounds of milk a year) would be very careful in the selection of a milker. Prospective owners of a De Laval Milker should note that the Breidablik Farm is maintaining high yearly records from its cows, and that the De Laval Milker helps produce milk so clean that it commands more than market price.

The Briedablik Farm manager reported recently:

"The De Laval Milker has proved very satisfactory. It saves from two to four men and about an hour and a half at every milking. It is very simple to operate and to keep clean. In fact, so much so that a green man can do the work as efficiently as an old hand. It pleases the cows, as can be seen by our high records. We have never missed a milking since we have had the De Laval Milker."

The De Laval Milker is a distinctly different type of machine. The Master Control of pulsation speed insures that every cow in the stable is milked in just the same way every day.

Write to nearest De Laval office for Milker Catalog, mentioning number of cows milked

A Cat Will Sit on a Hot Stove

By Geo. W. Fry

A CAT will sit on a hot stove until his feet begin to scorch—then watch him scat. The California dairyman has stood first on one foot, then the other, until he has scorched the soles of both feet. High cost of feeds and labor, combined with a never ceasing propaganda for the lowering of the prices of dairy products, has made a fire which is getting where he will have to jump and run.

Less than nine per cent of the boys drafted from the farms have returned to their original occupations. The others are either loitering about the larger cities or have taken employment in other lines. It is not because living conditions on the farm are uninviting, because these things have changed on the average farm in the last few years. The motor bus lines, the trolleys and automobiles have put the farm within a few minutes ride of the moving picture shows, the dances and other town amusements. The boys are not returning to the soil because of the long hours which are necessary to carry on a farm enterprise and the comparatively low rate of pay the farmer is able to offer. The country reared boy has, perhaps, always feared cutting loose from home ties, but after a year in the army he finds himself a man among men, able to care for himself, and he has naturally gone where he can obtain high pay for short hours of labor.

There is at present a great movement citywards from the farms. A recent survey in New York state showed 54,000 empty farm houses. What does this mean? What does this portend? Frankly, we, not being seers, cannot attempt to foretell. There is one thing sure, and that is that it means distress and misery for the family which deserts the soil for the rock bound streets of the city. As time goes on every one of these "immigrants" will wish himself back on the old farm, but can be get there, will be the problem. Some of them will gravitate back, but the larger majority will not be able to do so.

This treking citywards not only means distress and misery for the transplanted farmer, but if the process goes on much longer without a compensating movement farmward, it is going to mean distress in a greater measure for those who live in town and who must have the products of the land in order to survive. The soil is the foundation of all life and while it is vitaliy necessary that there shall be factories, stores and offices, it is more necessary that the supply of food be kept at normal.

The farmer the last few years has been like a man trapped in a house whose walls threaten to coliapse on him at any moment. As fast as he shores up one wall another begins to totter and away rushes the farmer to prop up that. No sooner does the farmer adopt scientific fertilization of the soil to bring up its waning power of production than he must adopt tractors and other labor saving devices to cut costs; when he has done this he must take up the newest theories in feeding livestock in order to combat the rising cost of feeds.

We hear a lot nowadays about collective bargaining, and there are those who think that Utopia will have been discovered when this is accomplished in the manner desired by them. It will help some, no doubt, in that it will put the farmer on a level with labor, who have been carrying on collective bargaining for a long time. But will this make more money for the farmer? We do not think so, for as soon as the farmer puts his goods on the market at a price making a decent profit possible the laboring man will decide that too much of his income is going out for necessaries and he will boost the price of labor and the manufacturer will pass it along to the farmer, who will be left at the post again.

Would a uniform reduction of everything restore things to normal? This has been advocated, but we do not see that much can be accomplished in this manner. A uniform lowering of wages and the price of products might do, but we are not economists enough to understand just how. In order to benefit the producer we have to change the ratio between costs and selling price, and this is the question we submit to theorists to solve for us.

Looking Ahead

By J. P. Iverson, Chief, Division of Animal Industry, State Department of Agriculture.

THREE years have elapsed since Governor Stephens affixed his signature to the hide and brand bill. In this brief time important events, far reaching in character to the cattle industry, have occurred, principal of which are the actual enforcement of the brand law and the welding of the cattlemen of California into a state wide, powerful and effective organizatioon, the California Cattlemen's Association. In addition, many smaller local associations, to support and locally extend the influence of the parent state organization, have been organized.

This means much to the cattleman. It will enable him through cooperation to solve many of the problems which have beset him in the past; for example, afford an improved system of marketing, provide better means of securing feed and transportation in short years, and, most desirable of all, place his interests in an influential situation with reference to legislation at the state capitol.

This act, while approved some three years ago, did not become effective until the following August. Necessarily, therefore, an interval of some time elapsed before the members of the board were appointed by the governor and before its preliminary organization was effected. It was not until October, 1917, that the actual administration of the brand law began.

A chaotic condition presented itself to the board and those in charge of the work of administration. The board came into existence without a cent of money, merely as an effort by the cattlemen of the state to protect themselves against theft and with no appropriation or state aid. Consequently, it was necessary to accumulate revenue with which to operate. Efforts were therefore directed through publicity toward acquainting the cattlemen of the state with the necessity of at once applying for brand recordation, and as time passed our efforts were fairly successful. It was recognized, however, that the recording and classifying of brands in a just manner was not only the preliminary undertaking, but that it was also the foundation upon which the future structure would depend. Further, it was at once apparent that classification could not begin until a considerable number of brands had been recorded; as a minimum, it was believed 10,000 were necessary, and this number was not received until early in 1918. The board then inserted notices throughout the press of California to the effect that all brands not received before a certain date would be given secondary consideration. This had the effect of bringing in a large additional number. Immediately after this the work of classification began, and as there were hundreds of duplications of brands then in use, several weeks were required to complete this work.

Plans were then laid for the compilation of a brand book, which was issued some time later and has been well received by our cattlemen.

By the summer of 1918 these and other preliminary organization matters were fairly well shaped, and plans were laid for proceeding with the actual inspection of cattle offered for shipment. This work was instituted progressively, beginning in the extreme southern part of the state and gradually continuing throughout the entire state until completion.

As we all know, considerable diffi-

The Santa Anita Studs

have been faithfully maintained to measure up to the high standards which marked their foundations, sustained by a firm confidence in the permanent place and usefulness of the draft horse in American agriculture and commerce.

The Percheron Stud

Our breeding Percherons represent the foremost blood lines of the breed, composed of individuals that have won high honors in the show ring under the decisions of some of the world's recognized authorities.

Included in our Percherons is Manon, in the first prize class at the great Percheron Show at Le Ferte, France, grand champion at Minnesota State, 1914, grand champion at Civic League Horse Show, 1915, and at the P. P. I. E. won first as three year old, also senior and reserve grand champion.

Another, an all-American product, is Oaklawn Queen, one of the champion stud of stallion and three mares at P. P. I. E.; also reserve grand champion American bred mare at that show.

Our Percheron mares have size, finish and bone and the fast, free action that is an important inheritance in the draft horse that is called upon to move heavy loads quickly.

To mate with these high class mares we have spared no trouble or expense in the selection of stallions, and the exceptional quality of their offspring indicates that our selections have been successful.

We offer at the present time six three year old registered Percheron stallions of our own breeding. They are first class in every respect, sold under our well known guarantee of satisfaction, and priced well within their value.

The Arabian-Thoroughbred Stud

Our Thoroughbred mares are from some of the world famous families, families and individuals whose past performances are too well known to the horse loving public to need repetition here.

With these mares we have mated our imported Arabian stallion Ibn Mahruss, and from these matings have secured a splendid lot of individuals that combine a maximum of beauty with a full measure of strength and stamina.

The Jacks and Jennets

We have one of the largest groups of registered breeding jennets on the coast, selected with careful regard to size and ruggedness.

To head them we secured the famous King Bersheba, recognized as one of the greatest show and breeding jacks in America. As a two year old King Bersheba won the championship at the Blue Grass State Fair, Lexington, 1914; also won honors in sweepstakes classes jacks of all ages.

We are now able to offer several three year old jacks with big bone and good heads, by King Bersheba and out of some of our best jennets. If you want a jack we are sure you will be well satisfied to see these before you buy, and remember that mules are selling at the best prices in years.

Registered Holstein-Friesian Cattle

Our herd of Holsteins offers an excellent selection to intending purchasers. The females of the herd include a large number of daughters of Prince Gelsche Walker out of high record dams which are headed by PRINCE WALKER CORNUCOPIA, by Prince Gelsche and out of Alba Sadie Cornucopia Creetia.

Registered Big Type Poland China Hogs

Our registered Poland China females include daughters of such high class big type boars as **Mac's Big Price, Big Bone Jumbo,** and **Superba**, the world's champion boar, and are headed by QUALITY BOB, grand champion at Wisconsin State Fair and rated by many judges as one of the outstanding boars of the breed.

culty was experienced in securing proper local inspectors on account of the small fees paid. We are, however, constantly strengthening this branch of the service.

There are approximately 1,000 slaughterers licensed under the provisions of the law, each of whom has filed a bond with the state in the sum of $1,000 to guarantee cattle owners against loss of any cattle that may be illegally slaughtered. Reports of all cattle slaughtered are made to the office each month, and these may be inspected at any time by persons interested. Many arrests have been made of persons who slaughter cattle illegally, and these arrests have resulted in eliminating a number of migrating "oak tree" and "auto truck" slaughterers.

To date, over 60,000 head of cattle have been inspected for marks and brands at loading corrals and slaughtering establishments by inspectors employed by this department.

There are at the present time nearly 200 authorized inspectors stationed throughout the state. Special agents are also employed to investigate reported losses of cattle and assist in securing evidence against persons accused of cattle stealing. The results of these investigations have been furnished officers charged with the duties of prosecuting cases of cattle stealing, and the services of the attorney for the department are available to assist the district attorney. This service has been greatly appreciated and has been of further assistance in checking the loss of cattle by theft.

In order to strengthen the law and provide for a more rigid enforcement, some further legislation will be necessary, and this legislation is now receiving the attention of interested cattlemen.

Higdon Holsteins Set New Mark

No more satisfactory public sale of pure bred livestock was ever held in the West than the dispersal of the W. J. Higdon herd at Tulare, May 5. The sale was at once a tribute to successful efforts directed along sane and constructive lines, and an opportunity of great importance to many men either now or about to be engaged in the production of registered Holsteins. The sale was an emphatic demonstration of the profitableness of the livestock business and the fact that there exists in this state a wide and sustained demand for the better kind of breeding stock at prices the equal of what can be expected in other states. It furnished abundant grounds for encouragement to younger breeders and marks a new step in the livestock history of this state.

Forty-seven head, consisting of seven bulls and 40 females, sold for a total of $46,760, making the splendid average of but a few dollars under the thousand dollar mark.

The sensation of the sale was the record established when the great young bull, King Korndyke Pontiac 20th, fell to the bid of Burr Farms, Los Angeles, for $12,000, the highest price ever paid for a bull of any breed at public sale on the Pacific Coast. And yet there is no question but that he is a cheap bull. It will be recalled that as a calf he was purchased in the guaranty sale of 1917 for the then record price of $6,500. That price remained the record until he again established a new one. King Korndyke Pontiac 20th is a son of King Korndyke Pontiac, the bull owned by Fred W. Kiesel of Sacramento. His dam is Miss Valley Mead De Kol Walker that has a three year old record of 36.81 pounds of butter in seven days and 1,113.58 pounds in 342 days. She is the highest record daughter of Prince Gelsche Walker. King Korndyke Pontiac 20th, while only a young bull, has demonstrated his ability as a sire of the first water. Burr Farm can count itself lucky in securing this bull and his going to Southern California means much to that rapidly developing Holstein center. It is of interest to know that already no less than 50 services have been booked at a price that will make him a great investment to the buyers. There were many bidders up to the $5,000 mark, where competition narrowed to Brown & Holmes. His sale marked the transfer of a great bull at a great price.

King Korndyke Pontiac 20th
$12,000 bull at the Higdon sale bought by Burr Farm, Los Angeles.

Mona Fobes, a 30.11 daughter of Mutual Fobes Longfield De Kol, and out of a daughter of Sir Ormsby Burke Segis, was the top female. She was taken by R. L. Holmes of Modesto at $2,100. During the past few months the critical buying of Mr. Holmes has been a feature of the better auctions He has secured the tops in five of the best sales and was the runner up on the record bull. With such material as Holmes has been selecting there is no questioon but that he is building a herd that will be one of the strong collections of the breed. Holmes also got the good cow, Winifred Hoataling 3d at $1,325, as well as a number of other of the better things.

One of the heaviest buyers at the sale was Santa Anita Rancho, which, by the way, sold King Korndyke Pontiac 20th for $6,500. They selected Blanche Nudine Clothilde Walker at $1,350 and seven other of the good buys.

The Stockton state hospital got five of the good females and made a particularly fortunate buy in the young son of the top bull, King Korndyke Pontiac Leda. His dam, Leda Henger veld De Kol Korndyke, is a 31 pound daughter of Korndye Queen De Kol's Prince.

F. F. Pellisier of Whittier bought the second high cow, Hollywood Lilith Pontiac, with a 36.20 pound record for $1,900.

Robt. Curtis and Son, Exeter, paid $1,750 for the 34.72 pound Coloma Butter Maid, rated by many as the outstanding female bargain of the sale.

EL PROFITO The Big Grand Champion Boar at Los Angeles Livestock Show

El Profito is at head of our well known big type Poland China brood sows at Santa Barbara.

For the next 30 days we will offer for sale a few outstanding good sows with litters by El Profito; also a fine granddaughter of Big Timm, with a great March futurity litter prospect by The Diplomat, best son of Liberty Bond.

Our foundation blood is all direct from the most popular big type herds in the corn belt. Every breeding animal in herd is recorded, and papers go with every sale. For want of help we are compelled to reduce our herd in numbers —first come, first served. Your letter will be promptly answered.

Viola L. Renwick Santa Barbara, Cal.

A Letter Addressed: W. H. ROUGH
Arlington, Cal.

Gets quick information to you on our big type Poland Chinas. We breed them to sell and we have what you want. Write today.

Yearling Daughters of Superba, Grand Champion Boar at P. P. I. E.

Our Poland Chinas are the genuine big type in blood and in reality—the offspring of the great Superba—the king of the big type Polands on the Pacific Coast. They also carry the close-up blood lines of such noted sires as Big Bob, Big Orange and A Wonder. It is the real pork type, the prolific type, the feeders' type. They make the ideal mothers, and they tip the scales at any age, six months and up.

Our herd is absolutely clean—never a case of abortion in the herd.

Our aim is to please buyers, so we will permit them to select from anything in the herd.

With a few exceptions our big young sows will be sold open, or they will be bred to order. Can show you sows with fine litters or sows carrying litters. Every animal in herd (except spring pigs) is recorded and papers go with every animal sold. Herd is open to inspection any day and every day. Write for particular information. Letters promptly answered.

Modesto, were other buyers at the sale.

This successful event was managed by C. L. Hughes of the California Breeders Sales and Pedigree Company, who has been such a factor in the Holstein development of this state. Ben A. Rhoades of Los Angeles was on the block and was assisted in the ring by George W. Bell of Tulare. The same team put across the last guaranty sale at Sacramento.

FEMALES

2, Hollywood Lilth Pontiac, May, 1916, 32.20 pounds; F. F. Pelissier, Whittier, $1,900.

DAIRY SHORTHORNS AVERAGE $600

By J. P. Bennett

An important event in the pure br d livestock development of this state was recorded when Thos. Harrison of Santa Rosa sold the first offering of Milking Shorthorns ever offered at auction on the Pacific Coast. The precedent was established with an average of $600 on the entire lot. The cattle were an attractive lot and drew breeders from a territory covering many states.

The top of the sale was the grand champion bull, Foothills Corporal, purchased by J. E. Mason of Center Point, Oregon, for $2,000. The top female was No. 28, the good cow, Betty Lee, purchased by the Oakleigh Stock Farm, Medford, Oregon, at $1,750. Dick Doddington of Willoughby, Ohio, secured the undefeated show heifer, Welfare's Belle at $1,700. Stanley Jones, Geyserville, California, took Ramona Lee at $1,000.

Oakleigh Stock Farm, J. E. Mason, Cunningham Brothers, all of Oregon, Dick Doddington of Ohio, C. H. Hinmann of Colorado, M. C. Bohlman, Placerville, California, and E. D. Connolley of San Francisco, were among the heaviest buyers.

The evening preceding the sale the visiting breeders and members of the press were entertained at a banquet given by Mr. Harrison, who is to be commended on the capable manner in which the sale was conducted. The sale ring and the seating arrangements were all that could be asked for.

Col. Harry Cranke of Idaho was on the block and was assisted in the ring by Cols. Leachman and Snook of Sacramento.

Following is a representative list of sales:

BULLS

1, Foothills Corporal, March, 1916, J. E. Mason, Center Point, Ore., $2,000.
2, Lord Wapsie 2nd, August, 1919, M. C. Bohlman, Placerville, $275.
4, Lord Oxford, April, 1919, A. E. Franklin, Grafton, Idaho, $200.
5, Circe's Favorite, October, 1918, C. H. Hinman, Denver, Colo., $200.
6, Grand Wapsie 2nd, April, 1919, C. H. Hinman, $200.
7, Duke of Brighton, February, 1919, John J. Hanson, Metropolitan, $310.
8, Major Wapsie, February, 1919, C. H. Hinman. $200.
9, Rosebud's Prince, September, 1919, Geo. H. Brundidge, Bakersfield, $275.

FEMALES

10, Foothills Trixie, May, 1918, E. H. Day, Gazelle, $500.
11, Martha L, February, 1914, E. H. Day, $550.
12, Diamond Matrix, May, 1917, Cunningham Bros, Glendale, Ore., $525.
13, Gloster's Maid, September, 1914, Cunningham Bros, $450.
14, Bessborough Lady 28th, February, 1914, E. D. Connolley, San Francisco, $850.
15, Countess Jr., July, 1914, Dick Doddington, Willoughby, Ohio, $450.
16, Alctha L, September, 1919, E. H. Day, $175.
17, Buttercup, March, 1915, E. D. Connolley, $700.
19, Foothills Poppy, August, 1917, E. H. Day, $500.
20, Foothills Lavender, March, 1918, M. C. Bohlman, $375.
21, Vocalist, March, 1917, Dick Doddington, $1,000.
22, Duchess Knight, August, 1914, Cunningham Bros., $725.
23, Clover Type, January, 1918, M. C. Bohlman, $350.
24, Ramona Lee, August, 1916, Stanley Jones, Geyserville, $1,000.
25, Bethsinda, July, 1915, Cunningham Bros., $400.
26, Foothills Wild Rose, October, 1916, E. H. Day, $700.
27, Welfares Belle, August, 1917, Dick Doddington, $1,700.
28, Betty Lee, August, 1914, Oakleigh Stock Farm, Medford, Ore., $1,750.
29, Solona Filipail 2nd, May, 1918, John Lynch Ranch, Petaluma, $325.
30, Rosebud 16th, January, 1919, E. D. Connolley, $500.
31, Naomi 2nd, February, 1911, E. D. Connolley, $900.
35, Shastina, September, 1917, Oakleigh Stock Farm, $800.
36, Hilarita Lee, November, 1918, Dick Doddington, $500.
38, Cherry Lee, February, 1918, Oakleigh Stock Farm, $426.
39, Juanita Lee, November, 1914, R. Hackley, Santa Rosa, $325.
40, Wild Eyes Princess 4th, October, 1918, Geo. H. Brundidge, $375.
41, Marsh Fern, March, 1918, E. H. Day, $425.
42, Frantic Girl, February, 1919, Dick Doddington, $700.
44, Virginia Lee, August, 1917, Oakleigh Stock Farm, $1,000.
45, Foothills Mary, May, 1916, E. D. Connolley, $650.
46, Yolande Lee, December, 1918, R. Hackley, $325.
47, Milkmaid, June, 1914, E. H. Murphy, Perkins, $400.
48, Volanthe Lee, May, 1919, Stanley Jones. $275.
49, Sequel's Milkmaid, October, 1919, Chas. L. Weaver, Tulare, $275.
51, Idlewood Maid 2nd, May, 1919, Oakleigh Stock Farm, $400.
52, Imp. Lady Christiania 9th, August, 1911, Oakleigh Stock Farm, $525.

Registered Hereford Bulls

We have a few choice bulls from one to three years old for sale.
Our Breeding Herd was purchased from the most noted breeders of the Middle West, and are of Anxiety Breeding.

An Important Livestock Event

First Public Sale
Caledonia Farms' Shorthorns
West Sacramento, Cal.
Thursday, May 27

70--Scotch and Scotch Topped Females--70

Imp. Caledonia

Gainford Matchless

Now is the Time---This is the Sale

There never was a better time to enter the Shorthorn business than now. Modern conditions are creating a wide demand for better bulls. California does not begin to produce enough bulls to supply our own needs. There must be more herds. The demand will absorb the surplus at profitable prices. Plan for the future. Those who enter the business now on a sound basis will be among the leaders a few years hence.

There has never been a better opportunity to secure Shorthorn females, in every way satisfactory foundation material on which to build a herd, than is afforded in the first sale from Caledonia Farms. The Caledonia herd is rated as one of the largest and choicest collections of the breed owned in America.

Every female in the sale will sell with a calf at foot or is heavy to the service of one or the other of the great Caledonia herd bulls: Imp. Caledonia, Gainford Matchless and Pine Grove King—three bulls of faultless breeding and outstanding excellence. Many of the cows with calves will be rebred—thus making a three-in-one combination. They include daughters of Glennbrook's Marquis, Fond Lavender, Pine Grove King, Whitehall King, Whitehall of Orange; Lavender Diamond; Bapton Pride; Champion of Scotland, Spicy Prince, Butterfly Viscount and other well known sires.

A goodly number of Scotch cows will be listed but the majority are of exceptionally strong American blood lines.

Those interested in Shorthorns should not fail to attend this sale—it represents a real opportunity.
(Signed) R. P. Royce, Livestock Editor, California Cultivator.

Initial Sale of Caledonia Shorthorns

The largest sale of Shorthorn females ever held in this state has been announced by Edward Cebrian, owner of the Caledonia herd maintained at Caledonia Farms, West Sacramento. Seventy head of cows, most of them with calves at foot or due to calve to the service of the celebrated Caledonia bulls, have been catalogued. This offering comes from one of the largest herds in America and a herd that is generally recognized as among the top herds of the country, and for those reasons the forthcoming sale is being regarded as one of the most important events of the year.

In planning the sale Mr. Cebrian said: "The Caledonia herd, as it stands at present, is too large for my present equipment. We have a large number of calves coming on and more room is imperative. In selecting the offering, I have had in mind furnishing an opportunity for as many beginners as possible to select a quality of foundation stock that will prove attractive. I have the utmost faith in the future of the Shorthorn industry in this state, but it seems to me that in order for the industry to expand as it should, that there must be a way found to help men not now in the business to get started. I am hoping the method I have adopted that of selling cattle at auction, will prove the means of establishing many new breeders. From my own experience I know that there is almost an unlimited demand for better bulls on the part of range operators, and this demand is certain to increase. That means that in order to fill the need many more females will be required. With that idea in mind, I have decided to offer only cows, either with calves at foot or bred. In the offering will be a number of Scotch cows, but the major portion will be Scotch topped cattle."

The sale will be managed by the California Breeders Sales and Pedigree Company of Sacramento.

Plain Talk

Here is some plain talk in Kimball's Dairy Farmer that provides food for thought:

It may occur to some readers that we are saying much about milk and its virtues, for which there is no substitute. It may seem to them that information of this sort should be told to consumers rather than producers of dairy products.

The knowledge is available, however, that farmers are among the largest users of so-called butter substitutes and many of them are really stingy with the use of milk; they skimp themselves and their children to sell every possible drop of milk they can for cash.

We can conceive of illiterate folks, underblessed with purchasing media, driven by necessity to economize by using margarines and feeding babies and children coffee and tea in place of milk in abundance. We can conceive of a rural family, the head of which does not know the invaluable properties of milk and its products, trying to economize and grow rich by following the same procedure. We do not believe, however, that there is a farmer so niggardly, so miserly, so stingy that he would stint his own table, starve his own children, shorten his own and his wife's lives just to sell a few more pounds of milk and cream if he really knew the true value of dairy products.

We do not think there lives a man on a farm who would sell butterfat and with a portion of the money buy margarines, if he knew that by so doing he is not only a traitor to his own business but is robbing himself and his own family of the one great source of health, growth, development, and life.

We know that a surprisingly large percentage of margarines are being sold to farmers for money they have received for milk and cream. We prefer to believe the reason for that is that they do not know the importance of what they are really doing rather than to believe that they are a stingy, greedy lot of fellows trying to save pennies at the expense of their home welfare.

We wish to believe that if we teach the value of milk and its products, show that there are no substitutes for them, demonstrate that even at retail prices they are the cheapest of foods—to say nothing of the prices farmers receive for milk and cream—our readers will not be numbered among those who are looked upon either with pity or condemnation as a lot who rob their own tables to save a few pennies and expect others to supply their tables at a cost of dollars.

Our secondary object in telling the story of milk and its products to readers is with the hope that they will aid in spreading the gospel so that in due time it will be well known around the table of every home in America that our nation may continue to stand out as the home of the world's strongest, most vigorous, most intelligent people in the future, even as it has in the past.

Milk has aided much in the past; it must be permitted to do much in the future.

A third reason we have in mind; skimmilk has ever been recognized as an excellent food for all young, growing animals. The farmer, and not the scientist, was the first one to say, "There is no substitute for milk in growing pigs."

The scientist has now proven the farmer right. Let the value of skimmilk be well considered before wasting or selling it at a price less than it is worth for feeding calves, pigs, chickens and children.

Beware of False Teachings

We have been told that the domestic science departments in some of our state educational institutions are teaching girls the doctrine that margarines containing animal fats other than butter fats are excellent substitutes for butter and that their use should be encouraged because of the body building elements which they contain. It is claimed by one of the institutions that the growth promoting element fat-soluble A is found in all animal fats.

We have read this pernicious doctrine in advertising literature designed to deceive the public, but we have never heard of the scientist who has discovered the existence of fat-soluble A in other places than those designated by Dr. McCollum. He says on page 89 of his book—"The Newer Knowledge of Nutrition"—"The vegetable fats and oils, such as olive oil, cottonseed oil, peanut and cocoanut oils, although good energy yielding foods, do not furnish this dietary essential," meaning the fat-soluble A.

"The body fats of animals, such as lard, beef fat, etc., are not important sources of the fat-soluble A."

Fat-soluble A is found in greatest abundance in milk, in eggs, in the livers and kidneys of animals. Margarines do not contain the growth-promoting element of fat-soluble A.

It is unfortunate that the margarine products do not contain virtues of their own that will permit them to be sold without claiming merits which they do not possess.

When agricultural colleges will permit domestic science teachers to give out this kind of information, then it is time for a change in the teaching force.

Such teachings are not only untrue but the effects are far reaching, and more than that, they are detrimental to human welfare.

There are millions of people who get the fat-soluble A element in the butter they eat. If they are told by people who ought to know better that margarine can take the place of butter in their diet, and an appeal is made that in this way the high cost of living can be reduced, then they are deceived to the extent that they starve their bodies.

The teaching force of our public schools is supplied, in a large measure from the young women who are trained in the state institutions where domestic science is taught.

It is difficult to conceive of the irreparable injury that would be inflicted upon the children of this nation should such teaching be carried into the pub

NOTES ON BUTTER AND OLEOMARGARINE

It is not surprising that so valuable and universal a food as butter should be particularly liable to adulteration and imitation. The usual sophistication is to manipulate these cheaper fats so as to make a compound resembling butter. The state dairy laws and the United States revenue laws provide that any artificial or imitation butter or substitute for butter composed wholly or in part of fat other than butter fat must be branded oleomargarine.

It is the common practice to include in all such spurious articles as oleomargarine butter, milk, or other dairy product in order to develop a flavor resembling that of butter. This is accomplished by ripening the milk to be added, which may be skimmed or whole in different proportions, and getting the proper degree of acidity, by adding what is known as "starter" or lactic acid bacteria. This ripened milk is added to the fat mixture, which is then agitated to bring all into one body. This is then chilled suddenly with a spray of cold water, after which it is tempered by holding in a room from 12 to 15 hours at a temperature of 70 degrees Fahrenheit. The sole purpose of this tempering is to bring out the flavor, and a decided change in flavor can be noted from the initial flat grease like taste to the final butter like flavor, which is due entirely to the action of the lactic acid bacteria in the milk.

Tests for Oleomargarine

There are several simple tests that can be used to distinguish between oleomargarine and butter. These tests are naturally of a preliminary nature, but serve very well for a rough determination.

The spoon test, also known as the boiling or foam test—Place about three grams (or a piece the size of a small chestnut) of the sample to be tested in an ordinary tablespoon and hold over a flame. As it melts stir with a splinter of wood. Bring to a brisk boil. Oleomargarine will boil noisily, sputtering like a mixture of grease and water, and will produce but little or no foam. Butter will boil with very little noise and will produce an abundance of foam. Renovated butter will act very much as does oleomargarine except that it produces usually a very small amount of foam.

The waterhouse or milk test—Heat a small amount (about 100 cubic centimeters) of sweet skim milk nearly to boiling and add five to ten grams of the sample to be tested. Stir with a wooden stick until the fat is melted, then place in a pan of ice water and continue to stir until the temperature falls sufficiently for the fat to congeal. At this point, the fat, if oleomargarine, can easily be collected into one lump by means of the rod, while if butter, it will granulate and cannot be so collected.

CURE FOR SWEENY

Writing to one of our Eastern exchanges, a horse owner gives the following remedy, consisting of good old home made soft soap, as a preventive or cure for sweeny. He says:

"For sweeny use the old fashioned soft soap, the kind our mothers and grandmothers used to make. The soap is made out of lye from wood ashes, old bacon or other fat. It is liver brown in color and one quart will cure a sweeny and it won't blister. Two years ago I started to plow and when I hitched up my mule team I saw the leader lame and I looked him over and saw he had sweeny. That evening I rubbed soft soap on with my hands in a round circle till the whole shoulder was saturated and frothy, and in the morning it was dry and I curried it off and plowed him all day and in evening I gave him another application. Did this for ten evenings. In two days' time the lameness left him and he filled up well in shoulder and never lost an hour's work. I have a 1,300-pound mule now that has sweeny in the right hind hip. He got hurt out in the yard playing. He either got kicked or fell on it, and the soft soap is curing him. It will cure horses and it won't take the hair off, either."

TESTIMONIALS

"Cows increased in one week 3 per cent in milk."
A. L. McCULLOCH, Alpaugh, Cal.

"I never saw hogs do so well or grow so fast as on this molasses ration." C. H. HARTWIG, Yuba City, Cal.

"It has enabled me to keep my stock in better condition at less expense." J. M. HENDERSON, JR., Sacramento, Cal.

"Have one calf that refuses to drink new milk—prefers skimmilk with molasses. What do you know about that?"
R. HECKLEY, Santa Rosa, Cal.

"It has been a great advantage in getting the stock to clean up the roughage." H. H. AMES, Chowchilla, Cal.

"One cow will turn down the choicest handfuls of alfalfa hay unless it has been 'Molassed'."

The Renwick herd of big type Polands at Santa Barbara enjoyed an exceptionally good mail order trade the past season and to the perfect satisfaction of all customers at that. A half dozen gilts and one brood sow were sold to Frank R. Morgan, Yuma, Arizona. Mr. Morgan visited the Renwick herd, making his own selections. One litter of pigs, that of the noted sow, Big Helen, sold for $1100, with an exceptionally fine young sow of the litter left on the ranch. The fine brood sow, Big Model 3d, granddaughter of Big Timm, has a very toppy litter of six big stretchy pigs, March 28 farrow, got by The Diplomat, best son of Liberty Bond. The big grand champion boar, El Profito, is still doing the honors of the herd. He has proved an A-1 sire of fine litters and would be guaranteed as such to any reputable breeder who is looking for a strictly up-to-date herd boar.

At the Underhill Hampshire breeding ranch at Santa Barbara things have been going smoothly and satisfactorily the present farrowing season. Seven and eight or more pigs saved to the sow is the rule, and they are evenly and beautifully belted and now enjoying the finest kind of thrift. A fine string of litters is accredited the great herd sire, Gen. Tipton's Masterpiece, and the old fellow more than ever looks the part of the splendid sire that he is. Another outstanding sire here is Exalted Ruler, with plenty of his fine pigs in sight. He is of mammoth size and proportions and is of correct conformation. Other families of great excellence are represented at the Underhill ranch by such sires as Blythedale Jim, The Cornhusker and others. The ranch management has the big annual midsummer public sale proposition now under advisement, with prospects for a fine array of breeding animals to be catalogued. The fact is, Mr. Underhill will permit many of his best young brood sows to go with this offering, he to retain a fair part of the offspring in the home herd.

Pathfinder's Perfection, the fine sow that cost Fred G. Ellis of Lindsay $1025 in the Diamond Bar sale, has paid off all incumbrances. She has farrowed 13 fine pigs by the Ace of Pathfinders.

R. K. Walker of the Winsor Ranch, Bonita, is off on a three weeks' jaunt among the big Duroc herds of the corn belt.

A sale of 60 saddle horses at Pasadena on May 25 will be made by R. L. English from his well known stables at Chino.

The top price in the Hartsook sale of Poland China brood sows at Lankershim, May 6, was $300.

Geo. M. Young of Ojai recently bought 12 young Duroc sows of Falfadale Farm, all bred to Great Orion Sensation, Jr.

W. H. Rough at Arlington, Riverside County, is known as a leading big-type Poland China fancier, and the herd today is in pink of condition and in the very prime of its usefulness. This is the home of the grand champion boar, Superba, of P.-P. I. E. show yard fame, and whose sweeping victories in the corn belt states are matters of history. The sons and daughters of Superba evidence today the high standard of excellence attained. The great boar, Supremis, by Superba, has proved himself a wonderful sire.

Bert Wilkinson, manager of Falfadale Farm Durocs at Perris, is lining up some real "toppers" as future public sale prospects. It is no secret that Falfadale will be able to wield the big stick on Winsor's Giant Orion blood. There are to be seen here 23 daughters of the big boar that will be mated to the big young boar, Great Orion Sensation, Jr., who is setting a fast pace for development. He now weighs 650 pounds and is keeping his every line intact.

Harvey M. Berglund of Dixon is having a brisk demand for Durocs at present and reports a number of good sales. His futurity pigs are coming in nice form and in addition to showing at Sacramento, Mr. Berglund is thinking of holding a sale in September.

Mrs. Ruth Mardy, manager of the Anchorage Farms Berkshires, never lets an opportunity pass to encourage pig club work, and has recently donated a boar pig, sired by Natomas Baron Duke, to the winner of the pig club contest at Geyserville.

Thursday, May 20, the Western Berkshire Congress will hold a sale of 35 registered Berkshires at the university farm, Davis. According to Bruce S. Bennett, field secretary of the congress, the offering has been selected from the leading herds in the state and will include bred sows, open gilts and a few boars of service age. It is said that the demand for Berkshires is the greatest in recent years and it is expected that the coming sale will result in establishing a number of new herds.

E. Lovell, manager of the Blackhawk Ranch, Diablo, left May 12 for Scotland for the purpose of selecting an importation of Shorthorns for the Blackhawk herd. This is one of the newer herds of California, but it is the intention of the owners, Messrs. Easton and Ward, to build one of the top herds of the country.

J. M. Henderson Jr., banker-dairyman of Sacramento, has recently furnished 22 young pure-bred Holstein heifers to the calf club organized at Live Oak. The calves average about nine months old.

Sierra Vista Ranch, Kyne & Nash, owners, at Perris, is now a well established Duroc-Jersey breeding headquarters. At head of the herd is the big boar, King Orion, Jr., a prize boar at the National Swine Show and grand champion at San Francisco. They also own California Great Sensation by Great Sensation. The spring litters include a few by Western Pathfinder, son of old Pathfinder. A bred sow sale is contemplated for January next.

A. L. Paddleford, manager for the Dos Pueblos Rancho at Goleta, reports the fine herd of Jerseys in A-1 working condition. The ranch management contemplates putting in a foundation herd of pure-bred Herefords.

E. R. Stalder has sold his ranch at Nuevo and is now located at Wineville. Mr. Stalder retains his herd of Holsteins intact. The herd bull, Rosamaines Pontiac Ormsby, is showing up some fine calves. One of these young bulls is out of a two-year-old heifer with a record of 20.69 pounds butter fat in seven days, a daughter of King Pontiac Netherland Segis 3rd. There are 16 registered cows now in herd, all bred to the herd bull. The Stalder herd is to be represented at the 1920 shows, Riverside and Los Angeles.

Robert N. Clapp is the new owner of the well known E. R. Stalder Holstein breeding ranch at Nuevo. Mr. Clapp has been a buyer of high class Holsteins at some of the recent sales. He likewise purposes importing others from the Middle West at an early day. Purchases of foundation Hampshires have also been made from the Underhill and Llano Vista Ranch herds. Such enterprise marks a real accession to the ranks of Riverside County livestock interests.

Among recent sales reported from the Llano Vista Ranch (Hampshires) at Perris is that of the fine brood sow, Nuevo Queen, to Robert N. Clapp at Nuevo. She is by Goldmine and out of Sioux Tipton, grand champion blood on both sides, and she has now farrowed 15 fine pigs sired by Sasin, a son of old Director. Another sale is that of five sows to Mrs. Beatrice Gantz at Fullerton. Seven gilts and one boar have gone to Thomas Childs, Ajo, Arizona. One hundred and fifty spring pigs are just now a chief attraction.

MY PHILOSOPHY

By James Whitcomb Riley

I allus argy that a man
Who does about the best he can
Is plenty good enough to suit
This lower mundane institute,
No matter ef his daily walk
Is subject for his neighbor's talk,
And critic minds of ev'ry whim
Jest all get up and go for him.

It's natchural enough, I guess,
When some gits more and some gits less,
For them-uns on the slimmest side
To claim it ain't a fair divide;
And I've knowed some to lay and wait,
And git up soon and set up late,
To ketch some felier they could hate
Fer goin' at a faster gait.

The signs is bad when folks commence
A-findin' fault with Providence,
And balkin' 'cause the earth don't shake
At every prancin' step they take.
No man is great till he can see
How less than little he would be
Ef, stripped to self, and stark and bare,
He hung his sign out anywhere.

My doctern is to lay aside
Contentions, and be satisfied.
Jest do yer best, and praise or blame
That follows that counts jest the same.
I've allus noticed great success
Is mixed with troubles, more or less,
And it's the man who does the best
That gits more kicks than all the rest.

ROYAL'S FAMILY

By Mary M. Parks in Youth's Companion

MRS. Royal Waldron, junior, becomingly clad in what she called her uniform—a kimono apron of lavender-checked gingham with white facings, and a mob cap to match—proudly piloted a tall, keen-faced girl about her tiny flower garden.

She led her visitor through the crowded flowers to a row of nasturtiums, parted the shining leaves, and tenderly lifted the fragrant blossoms. "This is the Empress of India, Joyce, and this yellow one is Golden King; the white is Princess Pearl, and the spotted cream, Prince Henry. Aren't they regal?"

The tall girl laughed and curtsied. "I'm pleased to meet their majesties," she said. Then, half enviously, "How you do love them, Helen! You belong over there." She nodded toward the splendid grounds on the other side of the low hedge.

Helen sprang up, and her lips parted; then she closed them again with a short laugh. She could not, even to her best friend, say anything that might seem a reflection on Royal's family; so she could not tell her how oppressive that immense garden, with its wealth of showy bloom and its stately gardener, was to her.

"It's a lovely background for my wee garden," she answered. "At this distance, framed as it is by the dark evergreens, it's like a beautiful picture."

She gathered two or three flowers of each color and handed them to Joyce. "I wish I could give you more to brighten up your schoolroom, but I can't spare many flowers, because we are to give a grand tea party tomorrow for all the in-laws—that is, the older ones. We want to make it something like the old time housewarming, but our resources are so limited that we have to take them in sections. The young folks will come next week."

"You shouldn't have given me these."

"Oh, there will be plenty, Joyce. I know how to make the most of them. Royal's family would give me some flowers, I think, although sometimes the gardener objects to cutting them, but we don't want them. Royal and I have everything planned. We know where every vase and bowl and dish is to stand. If we had anything more we shouldn't know what to do with it."

"Does Roy like all this contriving?"

"He seems to. Why shouldn't he?"

"Oh, I always thought that business men didn't like to be bothered with domestic affairs."

Before Helen could reply, a handsome, elderly woman stepped out on the veranda of the big house, and seeing the girls, waved her hand in friendly greeting.

"Was that Roy's mother?" asked Joyce, with interest.

"Yes," Helen replied, shyly. Her eyes were very sweet.

"She's a rather awe inspiring person, isn't she?"

"Not when you know her" Helen exclaimed. "She's really very simple and kind.

"I've heard that she can't cook the plainest fare," commented Joyce, curiously.

"She has never had to," Helen answered, a little defiantly.

"At any rate, Roy can't make disparaging comparisons," Joyce said, with a laugh, as she started to go.

Helen stood looking after her friend with a glimmer of mirth in her eyes. She had no fear of comparisons, for she was a housekeeper born and bred; and for her training she had only herself to thank. Her mother had been a capable, stirring, impatient woman who would rather do things herself than teach her daughter how to do them; but Helen, the only girl in a large family, had always haunted the kitchen. From the time when her eyes were on a level with the top of the table she had watched operations, asked questions and boldly tried her own hand whenever she found an opportunity.

Now she went into the house, and humming joyously, began preparations for the morrow. She was tired that night, but she had the satisfaction of knowing that everything was ready. The next morning she was out at dawn picking flowers with the dew still on them.

When breakfast was over the house in perfect order, she carried various receptacles to the cool back porch, and passed a happy hour in arranging the flowers to her entire satisfaction. There were golden nasturtiums for the dark hall, scarlet ones for the north lighted den, a bowl of pansies for the table, and so on throughout the house.

She was putting the last loving touches on her pansy centerpiece when the door bell clanged, and a moment later swift footsteps swept through the house. It was Royal's sister Maud, followed by a man bearing two large baskets. The girl's cheeks were glowing and her eyes sparkling with mischief.

"We have had to use so many flowers lately that we didn't dare ask the gardener for so much as a leaf. But luckily he went to town, and I stole these.

"Won't he froth when he misses these hollyhocks?" she chuckled, as she thrust the huge bunch of flowers that she carried in her arms into the umbrella stand. "These will do nicely here, and I brought things to hold the rest. I will arrange the flowers for you, dear; I always do it at home."

She went through the house like a whirlwind, scattering flowers in her wake. When she had finished and departed, the small dwelling was a suffocating tangle of ill assorted blossoms—ill assorted because they were too crowded. The vast spaces and dim nooks of the big Waldron house would have subdued both the color and the odor of the flowers. The crowning glory of Maud's scheme of decoration was a tall, flaring arrangement in the center of the little dining table!

Before Helen could get her breath and collect her scattered wits, the bell rang again, and a messenger left a package containing a gorgeous luncheon cloth loaned for the occasion by Aunt Jane. The rich material was heavily embroidered in tints. On Helen's little table the magnificent cloth seemed wholly out of place.

That was only the beginning. For several hours there was an intermittent flow of rich dishes for the table and handsome table accessories. Last of all, Royal's mother arrived, followed by a man carrying a huge cake.

"Hilda was once a confectioner's assistant," she explained, "and her icing is wonderful. Young housekeepers need a helping hand at a time like this; and besides, this is Roy's favorite cake." She looked round vaguely. "It's all very nice, of course," she sighed, "but I do regret that you undertook housekeeping: we all hope you will soon tire of it. It would be so pleasant to have you in the house with us, and so much better for Roy. The Waldron men are not at all domestic. Household matters bore them unspeakably. I must hurry on now, dear; I am giving a little talk at the Iris Club. You will understand, I know, if I cannot get here before six."

NO matter how pleasing the patterns selected, or how beautiful the materials, it is Drudgery, and nothing else, to sew on an old awkward machine incapable of fine adjustments or good sewing.

Such a machine takes the economy as well as the pleasure out of home-sewing. Besides it is a menace to good health and good dispositions.

It is easily possible to get the full present worth of your old machine and forever rid yourself of its many shortcomings. Trade in your old machine on

What a Player Piano Would Mean to You

It would mean rest and relaxation.

It would mean entertainment and quiet enjoyment.

It would mean singing, to those who like to sing—and dancing, to those who care to dance.

It would mean musical advancement to those interested in music—and musical growth to those who are taking lessons.

It would mean unfolding the whole world of music to you—to whose untrained fingers the Piano keyboard is mute.

It would ean HAPPINESS in the home, and that, after all, is what we are all striving for.

We carry the Aeolian Company line (makers of the famous Pianola and Duo Art), and offer a most varied line of Player instruments at a wide range in prices. Our convenient payment terms make owning a Player Piano a very easy matter.

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

Dealers in Steinway and Other Pianos, Pianola and Duo Art Pianos, Aeolian Player Pianos, Player Rolls, Etc.

The Wonderful Attractions of BRITISH COLUMBIA

Few countries possess all the conditions for happy, prosperous living as does British Columbia. The varieties of climate and soil offer inducements for almost every branch of agriculture. Whether in the warm interior valleys, the rich grazing table lands or the fruitful lowlands of the Coast or Vancouver Island, the advantages offered for

Dairying, Fruit Growing and Stock Raising

are such as must appeal to those who wish to improve their circumstances and at the same time live in a country of delightful climate, magnificent scenery, varied resources, progressive people and abundance of opportunity for development. British Columbia—the playground of America—is already famous for the production of its orchards, fields and dairies. Now, is the time to **Learn about this wonderful Province** and share in its possibilities. It's industrial life—mining, lumbering, fishing, manufacturing, transportation—assures a ready market at good prices for all the farmer can produce. Schools, churches, railways, roads, telephones, all the conveniences of an old land await you in this new Province of Opportunity and Success. As Mrs. Waldron, glowing with the consciousness of having performed a kindly act, glided down the tiny walk, like a stately ship down a narrow canal, Helen turned back and ruefully surveyed the towering cake. It was the most ornate she had ever seen. Her wedding cake had not been half so elaborate. "It looks anything but festive to me," she thought. "It suggests tombstones and monuments."

She chuckled at the thought, but the smile soon faded. Mrs. Waldron's words kept running through her mind, awakening doubts and fears that, since Joyce's call the day before, she had been trying to lull to sleep.

Roy's favorite cake, indeed She herself had baked a cake of the kind that Roy liked best, unless— She sank into a chair, staring hopelessly at the confusion round her, and trying in vain to repress the thought that forced itself upon her. What if Roy's apparent love of simplicity were only a kindly pretense; what if he were really bored by their simple life, and in his heart missed the luxuries and convenlences to which he had always been accustomed.

Helen sat very still; there was a dull little pain in her heart. Had he really been shamming to please her? If so, their happiness was built on sand. Now she remembered that at first he had taken it for granted that they should live, temporarily at least, in the big Waldron mansion. She had begged for a house of her own—a little house with a garden—a rented one, if need be, but a place where she could make a home for them. Royal came round to her way of thinking immediately, and he had never seemed to regret it. He consulted her wishes in every particular. He seemed proud of the little home and his clever homemaker. Was it all sham? Was he really yearning for the ease and luxury to which he had always been accustomed?

A familiar step sounded on the walk; Royal was coming, two hours before his usual time. Helen sprang up, started to the door, and then stopped short. She must banish all signs of her agitation before she met his sharp eyes. The door opened and shut, and after a long moment, Royal's head appeared between the portieres. His face wore a puzzled look.

"Why hollyhocks?" he asked, tentatively.

Helen eyed him keenly. Then a smile stole over her face. "Why not? Aren't they beautiful?" she asked.

"M-m-well, pretty enough; but I'd advise you to put a warning sign on the door. ''Ware hollyhocks,' or something like that. If a nervous person like that teacher chum of yours should drop in on her way home, and they jumped at her as they did at me, she'd fall over in a faint."

Helen's spirits rose with a bound. How cleverly he had described it! Those big, gaudy flowers in that tiny hall did seem to jump at you.

"Where did you get them, dear?" Royal asked.

"Your sister Maud very kindly brought them over," she replied.

"I thought I discerned my family's heavy hand in this," he said, grimly. He whirled, and strode back into the hall. There was a sound of bumping and thumping, and he reappeared presently, bearing the hollyhocks, umbrella stand and all, toward the kitchen. Helen followed in his wake.

"Royal Waldron, what are you doing?"

Royal put the umbrella stand in the farthest corner of the latticed porch.

"Just keep your eye on me, little girl," he said. He gave the umbrella stand a vicious kick. "I never did like that thing, anyway."

"Most of our wedding presents were so suitable," said Helen.

"That list of wedding presents was subjected to a rigid censorship, my dear girl," said Royal, wiping his brow.

"Censorship! What do you mean, Roy?"

"Just what I say. Aunt Jane, for example, intended to give us an immense cut-glass punch bowl. I told her that we might find stable room for it. In fact, I threatened to set it under the stable hydrant for Lady bird to drink out of."

"Do you mean that you asked her what she intended to give?" cried Helen, horrified.

"How else could I find out? I happened to know the make of kitchen cabinet you coveted. I told her, and—behold the cabinet. Dad meant to give us a European tour, but I mildly insinuated that a deed to this house would be more acceptable, and would cost him nothing, since he owned it."

"I never heard of anything like it," said Helen, feebly.

They returned to the dining room, where the immense cake at once caught Royal's eye; he stopped short, gasping.

"Your mother," Helen murmured Then, as her husband seized the mammoth cake, she added, "O Royal, her feelings will be hurt!"

"My family is not thin-skinned, Helen. On the contrary, it has a skin like a rhinoceros."

Along the entire length of the kitchen porch was a broad shelf, and on it Royal put the cake. "The thoughtful carpenter who built this house must have had some such occasion in mind," he mused. "My people, Helen,' he went on, "are admirable people—the dearest in the world to me—but to put it mildly, they are not adaptable."

Then he went through the house, gathering up his family's contributions to the tea party; he carried them all except the luncheon cloth, which Helen stealthily hid in a drawer, out on the porch, and put them on the shelf beside the cake.

"Like the hollyhocks, they require a large and rich environment," he remarked. "Among rank outsiders in the humbler walks of life, like you and me, they lose their sense of proportion—Gulliver among the Lilliputians. In the vernacular, they are not good mixers."

"Roy," Helen exclaimed, turning to him impulsively, "do you really and truly like being 'a rank outsider in the humbler walks of life'?"

Royal laughed uproariously. "Of course I do," he said. "I'm not a suffering martyr."

"But, Roy," Helen said, earnestly, "your mother says the Waldron men are not domestic. She says household matters bore them."

A strange look crossed Royal's face "Then I am not a Waldron man, Helen," he said, quietly.

"What do you mean?"

"Just what I say. I'm not like father and Henry. The Waldrons are born financiers; but I am like my Uncle Dan Emory. He failed in business again and again, and finally lost all he had and died poor—and broken hearted, I'm afraid. You see, dear, he hadn't my luck. He didn't marry a home-loving Helen. I am his living image, and though I'm Waldron enough to make a good living and to take care of what I have, I lack big business ability just as he did. Perhaps I ought to have told you before, but it has always been rather a sore point with me—and dad; and somehow I knew you wouldn't mind."

A look of relief came into Helen's face. "Mind! O Royal! I understand now, and I am so thankful. We shall have all we need."

"Now," cried Royal, flinging off his coat and rolling up his sleeves, "we will proceed to run this event according to the original plans and specifications."

That afternoon the family assumed the condescending manner of grown ups at a doll's tea party; but nevertheless, they seemed to enjoy themselves.

"I do hope they didn't feel hurt,' Helen said, remorsefully, after they had gone. "They were very sweet about it. Maud must have missed her flowers the moment she entered the house, but she didn't say a word."

"Hurt!" chuckled Royal. "You don't know them, Helen. If you could have seen as I did through that mask of polite unconsciousness they all wore, you would have discovered that they were not only highly amused, but pleased. My family like to manage other people's affairs, and yet there is nothing they admire more than sturdy independence. It was best for us to make our position clear, once for all They won't try to manage us any more."

As Royal had said, the family went home in a high good humor. "Wasn't that like Roy?" was the most severe comment they made. A little later, his mother expressed the changed attitude of the whole family when she said, "I am glad Roy married that sweet, sensible, unassuming girl. He is different, like poor Dan, and she seems to be a born manager. She is just the wife for him, I think."

EAT BEANS AND REDUCE LIVING COSTS

Potatoes are high, almost out of sight, rice is going up, everything is exceedingly high in price except beans. A larger consumption of beans on the part of the public will materially lower the cost of living and they are about the only important food product that is reasonable in price at this time; in fact, materially lower than prices which prevailed two years ago. Beans are sold closer to the cost of production than any other staple food and are therefore the most economical edible in daily use.

Domestic beans are an excellent substitute for potatoes and meat, and with the warm weather coming on, being rich in protein, the importance of their food value and low cost should be more fully realized by the average housewife. This is especially important when the housewife is having great difficulty in trying to keep the grocery and meat bill within the limits of the family income. Another advantage that beans have over the ordinary edible is that they can be purchased in quantity and put away in the pantry without any possibility of deterioration. Every housewife should avail herself of the present low price and put in a supply against a rise in price later in the season.

The average housewife thinks of beans only as something to be boiled or baked. This is a wrong idea. Beans may be prepared in many different and palatable ways. They are also one of the few foods that may be cooked, set aside and afterwards reheated and served. In fact, the second cooking improves them wonderfully.

One of the most economical ways to prepare beans is to cook them at the same time the Saturday or Sunday roast is being prepared, or when baking bread, cake or pastry, making the same heat do double duty. Beans do not necessarily have to be eaten the same day, but can be put away in the ice chest or cooler and served either as the main dish or with the "leftovers" from the preceding day. Those housewives who have a fireless cooker will find it a very simple and convenient matter to prepare beans with practically no trouble or fuss.

The high cost of potatoes and other starchy foods, so necessary to human consumption, can be met by substituting more domestic beans, thereby keeping the grocery bill within the limit allowed by the family income. Eat beans.

The following recipes have been tested and found excellent:

Beans (Old Style)

1 quart large or small white beans, 1/3 pound fat salt pork, 1/4 cup New Orleans molasses.

Parboil beans until the skins slip; drain off the water, then cut the salt pork in small pieces, adding the molasses. Mix well, adding salt to suit taste; cover all with water about two inches and bake in slow oven. The bean pot must have a tight cover. Do not take cover off until the beans are done.

Spanish Beans

2 cups Mexican Red beans, 2 small onions, 7 small peppers, 2 tablespoons olive oil.

Soak beans over night and in the morning drain, cover with cold water and set on stove to simmer until tender. Chop onions and peppers very fine; season with salt and cook onions and peppers for five minutes in two tablespoons of olive oil. Add to the beans and let simmer for at least another hour.

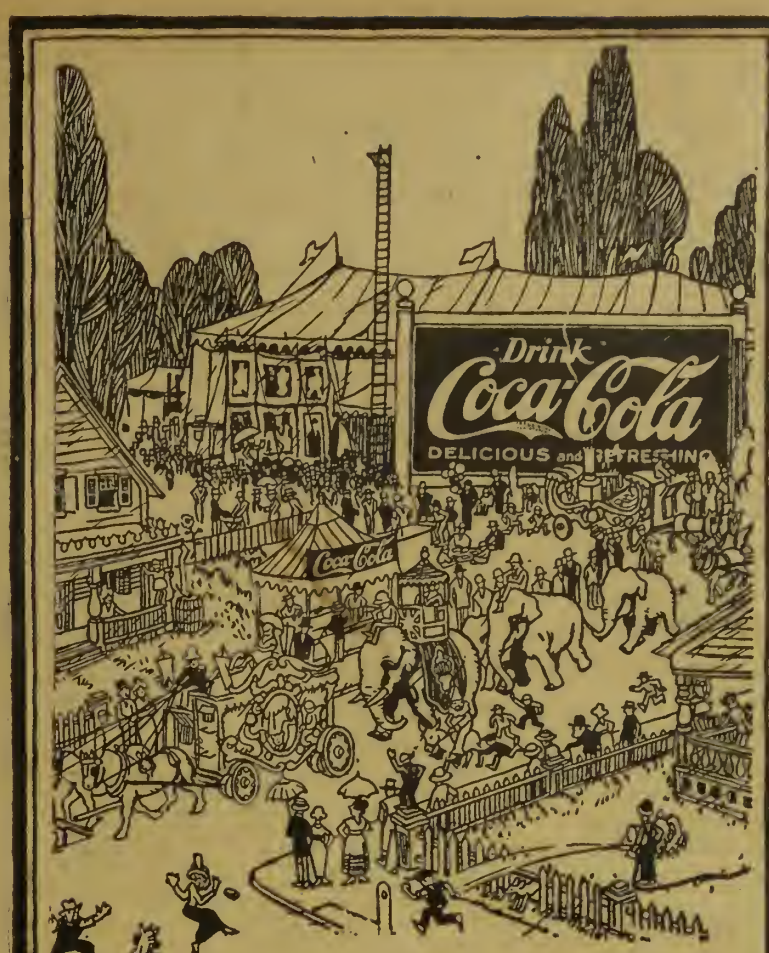
This dish is sufficient for six persons if served as a principal dish. If served with a meat course it will be sufficient for ten persons. It is especially convenient for a Sunday menu, as it may be cooked Saturday and heated again for the Sunday meal. It gains in flavor by the double cooking.

Boston Roast

2 cups cooked beans, large or small whites; 2 cups grated cheese, 1 cup crumbs, 1½ tablespoons salt, ¼ teaspoon pepper, 1 pimento.

Put beans through a meat grinder. Add cheese, crumbs and seasoning—the pimento may be omitted. Add sufficient water to form into a stiff roll. Shape and bake in a moderate oven, basting occasionally with fat and water.

(More bean recipes next week.)



—when "delicious and refreshing" mean the most.

SOIL MOISTURE DEMONSTRATIONS IN LOS ANGELES COUNTY

Professor J. W. Nelson of the college of agriculture will be with the Los Angeles County farm bureau to give a series of soil moisture demonstrations in various parts of the county.

The past two years of rainfall shortage has resulted in deficient water storage in soil and in mountain streams. Although the rainfall has been practically normal this season, the soils have not taken the moisture as they should. There is dry soil at four feet in many orchards. Unless properly irrigated and cultivated there is great danger that the trees will be seriously injured. For these reasons it has been thought advisable to stage demonstrations on the proper method of handling this serious problem. Professor Nelson is an expert on soils.

Demonstrations will be held: May 15th, Owensmouth-Chatsworth, place of Thad Harvey 15th, 2:30 p. m., Covina, ranch of W. P. Watts; 17th, 10 a. m., Pasadena, place of C. Stone; 17th, 2 p. m., Alhambra-San Gabriel, place of Frank Hoffman; 17th, 8 p. m., La Verne-Claremont-San Dimas, at Moneta high school; 18th, 10 a. m., Monrovia-Duarte, place of Rupert Turnbull; 18th, 8 p. m., Los Angeles City Center, at chamber of commerce; 19th, 10 a. m., Whittier, Leffingwell Ranch; 19th, 2 p. m., Downey, place of H. Koopmann.

CONTROL THE COYOTE

The coyote is not necessarily a bad citizen. At least this is a statement made in "Control of the Coyote in California," by Joseph Dixon and published by the experiment station of the college of agriculture as bulletin number 320.

"On the sheep range he is a menace; in a squirrel-infested country he is a benefit. If we kill off all the coyotes we must face the problem of ourselves accounting for the thousands of ground squirrels and jack rabbits which the coyote now destroys annually. The coyote stands second among the fur bearers of California. Certain prime pelts have recently brought up to date trappers $20 apiece. In order to bring such a price the pelts must be prime and properly prepared. Control rather than extermination should be our aim in most places. In certain sections actual extermination may be justifiably striven for.

The following methods of control have proved most successful: trapping; poisoning with strychnine in suet pellets; digging out dens containing young.

Coyotes have been successfully fenced out of certain sheep ranges in Mendocino County.

The bounty system is vastly expensive, productive of endless fraud, and does not give general or permanent relief.

Where coyote control is needed, continued, cooperative efforts between the interested counties and the federal government should be encouraged.

The coyote is the most widely distributed as well as the most destructive carnivorous animal now existing in California. Although known by sight to nearly everyone, the coyote is sometimes mistaken for the true gray or timber wolf, a much larger animal believed to be extinct now in this state. Coyotes occur in greater or less numbers in practically every county in the state.

Preparation and Care of Coyote Pelts

To be of greatest value in the fur market coyote pelts should be prime (taken between December 1 and February 15) and prepared as follows:

1. The skin should be cased, not flat; that is, in skinning, the opening cut should be made from the sole of the foot, down the back of each hind leg to the base of the tail; also the tail should be split its whole length and the bone removed.

2. All dirt, grease, cockle burs, blood clots and other foreign substances should be washed or combed out of the fur.

3. All pelts should be thoroughly fleshed; that is, all fat and adhering pieces of meat scraped from the flesh side of the skin.

4. Each ear should be skinned out so as to turn inside out clear to the tip, in order to prevent "slipping" of the hair on the ears. The cartilage should preferably be left in, attached at the rim.

5. The pelt should be dried, flesh side out, on a stretching board, in an airy, shady place. Before it becomes entirely dry it should be turned fur side out and thenceforth kept that way.

6. If coyote pelts are to be kept for several months they should not be left hanging over a beam in a shed or building to be ruined by moths and dermestes. They should be fumigated by placing them in a tight box together with a saucer nearly full of carbon bisulphide. Care should be taken to keep all exposed lights away from the explosive carbon bisulphide fumes. The pelts will then be safe from insect pests for months if left in the box.

TRUTHFUL

A young foreigner was being tried in court and the questioning by the lawyer on the opposite side began.

"Now, Laszky, what do you do?"

"Ven?" asked Laszky.

"When you work, of course," said the lawyer.

"Vy, work—"

"I know," said the lawyer, "but what at?"

"At a bench."

"Oh!" groaned the lawyer. "Where do you work at a bench?"

"In a factory."

"What kind of a factory?"

"Brick."

"You make bricks?"

"No; de factory is made of bricks."

"Now, Laszky, what do you make in that factory?"

"Eight dollars a week."

"No, no! What does the factory make?"

"I dunno; a lot of money, I think."

"Now, listen! What kind of goods does the factory produce?"

"Oh," said Laszky, "good goods."

"I know; but what kind of good goods?"

"The best."

"The best of what?"

"The best there is."

"Of what?"

"Of dose goods."

"Your honor," said the lawyer, "I give up."

DR. HESS Instant Louse Killer Kills Lice on Poultry and Stock

Use it on your lousy hens and chicks—your lousy colts, horses and cattle. You'll get better chicks—bigger, better fowls—more eggs—better contented stock.

Chicks are apt to be lousy now. Give them a chance. Sprinkle Louse Killer into the feathers, about the coops, on roosts, in nests of laying and setting hens. Always keep Louse Killer in the dust bath. For lousy horses and cattle, colts and calves, stroke the hair the wrong way and sift in Louse Killer.

We authorize dealers to return your money if it does not do as claimed.

1 lb. 30c, 2½ lbs. 60c (*except in Canada*)

Banish the Fowl Tick

THE fowl tick—sometimes called "blue bug"—and probably the worst chicken parasite known to the Southwest—centralizes its activities in western Texas, southern New Mexico, Arizona, southwestern Oklahoma, southwestern California, and portions of Florida. It is a blood-sucking insect which does not establish or maintain itself readily in the humid and cooler sections of the country or in the higher mountain regions. The fowl tick concentrates on chickens although it will also attack turkeys, geese, ducks, pigeons, ostriches and guineas, the turkey ranking next to the chicken as a popular host. The fowl tick wreaks destruction by reducing the vitality and condition of the birds as well as minimizing egg production. Fowls raised where ticks are numerous are often stunted in growth. Another source of loss is desertion of the nests by sitting hens, caused by annoyance from the ticks. Death often results in the case of heavy infestation, the parasites draining the fowls of blood and also poisoning them with certain secretions.

In some instances the ticks are so hungry and so plentiful that they swarm over the fowls by the thousands. The symptons are usually weakness in the legs and droopiness of the wings, the chickens being unable to walk or even get up on the roost. The feathers appear ruffled and there is usually a loss of appetite. The comb may or may not appear pale. Sometimes death occurs a day or so later. Chickens, soon after hatching, are often killed by becoming infested with ticks.

The chicken tick or "blue bug" is the bedbug of the fowl family. Usually its presence can be determined by examining the ends of the roosts or pulling up loose pieces of bark or boards about the roosts rather than by examining the fowls themselves. Ordinarily during warm weather the eggs hatch in from 10 to 15 days, while in cool weather the hatching period sometimes exceeds three months. The young ticks have six legs and are grayish in color; they usually prowl about the roosts, searching for fowl upon which to prey during the night. They crawl upon the legs of the fowls and attach themselves on various parts of the body, especially where the feathers are not very dense. The ticks attach themselves in bunches on the host and usually are concentrated on the breast, under the wings and on the thighs and neck. They attach themselves very firmly by their spiny mouth parts and suck blood, usually continuing their blood feast for about a week or 10 days. Then, blood-gorged, they drop from the fowl and seek a secret hiding place. Four to nine days thereafter the seed ticks shed their skins and acquire an additional pair of legs as well as more size. Henceforward, they work entirely at night, biding in crannies and crevices during the day time. Following each of the first three meals of blood the skin is shed and at the time of the last molt the adult males and females appear. After partaking of another meal of blood the females are ready to lay eggs, the average production being 500 to 900 eggs a female.

Pests Live for Years

The longevity of the fowl tick is remarkable as some of them have been known to live over two and one-half years without any food, and unquestionably, in infested chicken houses many of them survive longer than this, even when all poultry is excluded.

The rapidity of breeding depends largely upon the temperature. Hot, dry weather apparently does not interfere with the development of the chicken tick; in fact it appears to be at home under such conditions.

It is difficult to control fowl ticks by the use of chemicals, although two satisfactory solutions, carbolineum and petroleum, have been found to be effective. Carbolineum is more destructive to ticks than is petroleum. It persists longer and possesses the advantage of drying into the wood so as not to soil the fowls. Anthracene, which is the principal constituent of carbolineum, has been found to be about as effective as the latter material. The limiting factor here, however, is the difficulty of obtaining this material on the market. Creosote oil, containing eight to 20 per cent tar acids, is also very destructive to fowl ticks but is difficult to use in a spray owing to its caustic effects on the operator. When applied to the roosts and crevices with a brush it destroys all ticks touched and persists well.

In eradicating ticks it is essential to destroy by fire all the infested material and other equipment which is not valuable. When either crude petroleum or carbolineum is used it is necessary to spray the entire interior of the chicken house by thinning the oil with one part of kerosene to two parts of carbolineum or crude oil Where these materials are used in a tight house it is advisable to keep the chickens out of doors for one night in order that the material may dry in thoroughly over the wooden surface. Ordinarily one general treatment is sufficient, although if the ticks still persist, subsequent treatments with a brush about once a month for two or three months are ultimately effectual in banishing ticks.

The natural tendency of the tick in all stages is to crawl upward and not on the ground, and hence it has been ascertained that a roost supported from the floor of the house and kept entirely free from the walls is by far the most satisfactory. It is also necessary to have the roost fitted together in such a way that it can be examined or knocked down with ease. This can be accomplished by using two by four's as roosts which fit in notched end supports that in turn rest in notched uprights. The nests should be simple in construction so as to facilitate prompt and complete removal and treatment.

Clean-Up Not Expensive

The cost of the fowl tick clean-up is not prohibitive. Carbolineum costs from $1 to $1.50 a gallon, while crude petroleum costs from five to fifty cents a gallon, according to the distance from supply. A chicken house 12 feet square of the frame type which is common in the Southwest requires about four gallons of carbolineum or five gallons of crude oil when thinned with kerosene at the rate of two gallons with carbolineum or one gallon with crude petroleum. That would make the cost of one treatment with carbolineum about $4.50, while where large supplies of crude petroleum are available spraying with it would cost about 70 cents.

It is much easier to exclude fowl ticks from clean premises than to destroy them after they are once established. On this account persons beginning the chicken business should practice every precaution against the tick. Select a site well apart from other premises where ticks are known to be, and in constructing poultry houses and arranging other equipment, follow all tick controlling management. Start out with chickens hatched from incubators on the premises or secure day old chicks from hatcheries known to be tick free. Where, for any reason, chickens are imported to the place, they should be placed in temporary coops in small yards for ten days and held in quarantine, as during this period the seed ticks, if there are any present, will become engorged and desert the fowl. A chicken may then be treated with sodium fluoride or any good lice powder for lice and liberated. Quarantine coops should then be burned or sprayed with carbolineum or crude oil.

An all-metal chicken house is the best armored shelter to prohibit the entrance of ticks. However, such a building is expensive and also excessively hot during the summer. It is important in this case to provide hinged panels on all sides of the building to facilitate ventilation during hot weather. By the use of metal roosts and tick-safe nests, it is possible wholly to exclude all ticks from such a house.

Not only will the control measures outlined above eliminate fowl ticks but they also will accomplish complete destruction of the common chicken mite should it be present. In fact this method is the best means of destroying the chicken mite. Carbolineum is effective in controlling chicken lice, but since lice remain on the fowls constantly and do not get upon

the roosts, the spraying of the building will not accomplish their complete destruction. They should be dusted for lice, also. Proprietary remedies which are sold commercially and advertised as sure killers of ticks are usually more expensive and probably not as satisfactory as the remedies recommended in the foregoing paragraphs. Other "cure-alls" which are sold commercially and which are to be rubbed on the fowls or else fed to them are, as a rule, very unsatisfactory, as it is preposterous to suggest that any material sufficiently strong to kill a tick may not also kill the fowls when fed to them before accomplishing the eradication of the ticks. It should be remembered that the ticks may be hidden away in the cracks and may not visit the fowls for a month or even a year. In nearly every case such remedies are prepared and sold by men who are not familiar with the essential facts regarding the life history and habits of the ticks or "blue bugs," and too often by those who are ready to take advantage of poultry raisers seeking relief from the ravages of the pests. Complete information regarding the fowl tick is contained in Farmers' Bulletin 1070 which has just been published by the United States department of agriculture.

Poultry Queries

Conducted by J. A. Koethen

Rhode Island Red Eggs

I am writing to ask what color S. C. R. I. Red eggs should be. A five dollar setting from a breeder contained all shades from white to brown, a second was no better. Now I take as much pride in the appearance of my eggs as in the birds and think they should be uniform in color to look well. I would be ashamed to ship eggs like those if I cared anything for my reputation. Please tell me where I can get pure bred R. I. eggs that I can depend on.—Subscriber, Galt.

I do not know of any breeder who pays much attention to the tint of his eggs, though there must be some who do. As a rule, I fear breeders breed for points rather than for tint of eggs, and any shade of egg goes. It is a pity it is so, for the eggs from every flock should be uniform in tint. Here is one point of difference between the fancier and the commercial poultryman. The poultryman must ship eggs of unfform tint. The fancier is not concerned about production. He looks at feathers and type only.

Swelled Head

I have just lost a Barred Rock hen from swelled head. It began with the dropping of the feathers on her head, then the head became so swollen that it stretched her eyes out of shape. She was fat and apparently in good condition till I found her dead under the roost.—Subscriber, Auburn.

What made those feathers drop? Was it a belated molt or too much attention from the male bird or had depluming mites been at work? If there were mites the stubs of the feathers would have remained. Possibly the feathers dropped because she was trying to molt and then took cold. If there was any stickiness about the eyes it would certainly indicate the roupy condition we commonly call swellhead. If there was no stickiness I should suspect some external injury such as pecking by other birds.

NEW ASSOCIATION

Covina poultry breeders, both professional and amateur, have formed an association. At a meeting week before last at the home of Edward Insley in Covina, poultrymen of the distrtiot of Los Angelees County between LaVerne and Baldwin Park, elected Smith Elston secretary and arranged for another meeting in Baldwin Park to complete the organization. This is a splendid move and completes the organization of all the territory from San Gabriel to Ontario. When the whole country is organized, poultrymen will find it easy to secure their rights.

A. P. A. CONVENTION

Notice has been received of the annual meeting of the American Poultry Association at Kansas City the second week in August. The convention committee, which consists of T. E. Quisenberry and ten other prominent Kansas City poultry people, promises "a real revival convention that will be interesting, instructive and that will really legislate along progressive, constructive lines."

No. 2, 26.
Diamond Brand Buds, 34.
Golden State Buds, 34.
1918 No. 1 price was 28; fancy budded, 31½.

HAY

From Weekly Market Letter of Alfalfa Growers of California.

Arrivals of new alfalfa hay, show some increase as expected at this time but the better grades were still in light supply and were eagerly picked up by buyers at about last week's prices, and the current demand for first class hay still exceeds the supply. The demand for Foxtail mixed alfalfa hay, fit for feeding, was also stimulated and new arrivals of it found a ready market at a discount from standard grades, varying according to quality.

It looks now as if the first cutting were going into immediate consumption to a greater extent than in former years, leaving a relatively small surplus for future marketing. This would also lead to the current consumption of the second cutting to a greater extent than usual.

The second and third cuttings furnish the bulk of the surplus needed for winter consumption and prices during the next few months depend therefore, largely on the rapidity with which growers market the hay from these two cuttings.

It is too early in the season to make it possible for the association to gather sufficient definite data for estimating the size of the total crop of the year and the amount of the marketing tonnage available for shipment to central markets, but the indications so far would seem to be that the total of the state will be rather light again.

The tendency among our growers is to market their hay gradually as far as possible, at the rate at which it is called for throughout the year. In this connection, arrangements for pooling and carrying the hay have already been made by our growers in several districts. The object of this is to stabilize the market by preventing the usual midsummer glut in excess of demand, which results in demoralization of prices below cost of production.

For future delivery from later cuttings, bids of equal to about $30.00 delivered Los Angeles, continue to be made by larger consumers for their winter supply, but so far our growers are not disposed to commit themselves to that extent, considering the uncertainties of alfalfa farming.

Present prices f. o. b. Los Angeles are as follows: Choice alfalfa, 37.00; No. 1 dairy alfalfa, 34.00; standard dairy, 32.00; Stock alfalfa, 28.00.

GRAIN AND FEEDS

Price bid local grain exchange, May 5:

GRAIN

Wheat: The prices are based upon Federal grades and standards at the terminals in San Francisco bay and Los Angeles and are as follows per bushel of 60 pounds:

Hard White—	Per Bus.	Per Cen.
No. 1	$2.20	$3.63 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.13	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51⅓
Club and Sonora—		
No. 1	$2.16	$3.60
No. 2	2.13	3.58
No. 3	2.00	3.48 1-3

The above are minimum prices.

For sacked grain add 4½ cents per bushel to the above prices. Deduction of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.

Oats: Red feed, 3.15@3.30.

Corn: California yellow, 3.50@3.65 per cental; Egyptian white, 3.80@4.00; milo maize, 3.35@3.45.

Barley: No. 1 feed, 3.30@3.40.

HAY

Under date of May 8 Scott-Magner says:

Receipts past week 960 tons. Strike conditions of the railroads seem to be far from being in satisfactory shape. Most of the receipts in the past week have been from California points which shows quite a change from the last two months when most of the hay has been arriving from Oregon and Nevada. Very little hay is offered on the market, and our prices this week are more or less nominal. New alfalfa is being baled in many districts and volunteer, as well as some barley hay, is being cut in other sections. It seems to be a general desire to get hay into market as fast as possible in order to obtain the high range of prices or as near it as possible of the old crop. Several sales of first cutting alfalfa have been reported in the country some being as high as $25 for clean first cutting containing no foxtail or needle grass. These are extreme prices for choice quality, however, and only obtained where immediate pressing local demand has created abnormal conditions. The car situation is a serious proposition and the great rush of new hay coming will certainly not improve it.

We quote today wholesale prices in carload lots (old crop) as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:)

Fancy Wheat hay (light 5 wire bales)	38.00@41.00
No. 1 Wheat or Wheat and Oat hay	35.00@38.00
No. 2 Wheat or Wheat and Oat hay	32.00@35.00
Choice Tame Oat hay	37.00@40.00
Other Tame Oat hay	33.00@37.00
Wild Oat hay	Nominal
Barley hay	Nominal
Alfalfa hay	30.00@32.00
Stock hay	29.00@32.00
Oregon Cheat and Oat mixed	29.00@32.00
No. 1 Barley straw, bale	70@1.00

Citrus Markets

Los Angeles, May 12, 1920.

Unloading of refrigerator cars which had become piled up in the recent rail strike has been the feature of the last week's citrus market. New York auction handled 60 cars in one day, yet this resulted in no serious slump and $8.00 and even $10.00 prices are still named on occasional fancy lots. Picking has been resumed and shipments are again at normal. F. o. b. prices are ranging between $5.00 and $6.00 according to size and quality. Large offs are proving specially unattractive. Lemons are still quiet induced by the enormous number from Mediterranean.

Shipments

Shipments of citrus fruit to date from Southern California since November 1, 1919: Oranges, 17,312 cars; lemons, 3,440 total, 20,752. To same date last season, Oranges, 19,844; lemons, 4,804; total, 24,-

648. From Central California this season: Oranges, 4,858; lemons, 286; total, 5,144. To same date last season: Oranges, 2,722; lemons, 251; total, 2,973. From Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

Saving Labor in Sugar Beets

MANY farmers are solving the the labor problem by using larger implements and more horses. Such practices have enabled sugar beet growers greatly to reduce their expenses for man labor and increase their operations. The normal man labor required in growing sugar beets will vary from 80 to 135 hours or more an acre, say specialists of the United States department of agriculture in Farmers' Bulletin No. 1042. Under average conditions, where more horses and larger implements are used, they add, the man labor on machine operations will be reduced approximately 25 per cent.

A direct comparison of plowing crews in Michigan and Ohio, where conditions under which the work is done are uniform, shows that approximately one hour an acre less of man labor is necessary to operate a plow drawn by three horses than by two. With the larger outfit, as also when a tractor is used, a float or plank can be attached to the plow, and thus the breaking of a cloddy surface can be done with little additional effort or cost. In disking in the Michigan and Ohio districts it was found that a four horse outfit saves one-quarter of an hour of man labor an hour over the two-horse equipment.

Saving In Sugar Beets

Cultivation of sugar beets furnishes a striking contrast in crew efficiency. In Michigan and Ohio it was found that 1.9 man-hours an acre were required to cultivate once over with a one-row implement, 1.6 man-hours with a two-row cultivator, and only 0.9 of a man-hour for a four-row cultivator—a distinct saving in man labor by using the four-row machine. As many fields require attention before it is possible for the grower to get the work accomplished, any saving of labor and time is an advantage to the growing crop and affords more man labor for crops competing with the sugar beet in the distribution of labor.

Under average conditions a crew of one man and two horses working continuously will lift approximately 1½ acres of beets a day. A crew of one man and four horses will probably increase this area to two acres, or possibly 2½ acres a day under favorable conditions. The performance of the lifting implement can be improved still further with the addition of more horse power. If, by using an extra horse on the lifter, this work can be performed in a shorter period, more time will be available for hauling the beets to the factory or loading station.

Harvesters Mean Further Economy

An appreciable saving in farm labor will undoubtedly be accomplished through the development of mechanical harvesters. The hand labor on sugar beets, comprising such operations as blocking, thinning, hoeing, pulling, topping and loading, constitutes from 52 to 75 per cent of the total man labor required in growing the crop. The pulling, topping and loading, when combined, makes up 24 to 42 per cent of the work. Estimates made hy several growers show a variation of 24 to 30 hours in the labor requirement for the hand work in harvesting. It is very apparent, says the bulletin, that this amount can be reduced to a few hours an acre with the introduction of the mechanical harvester. This will in turn release man labor for other important work during the fall months.

In hauling sugar heets to the factory crews usually range from two to eight horses driven by one man. The load consists of approximately one ton for each horse. In California, a crew of one man and eight horses is sometimes employed. Such a crew frequently handles two loads, each weighing about four tons, which in many sugar beet sections would be divided into four loads, and three additional men would be required to drive the wagons. By using more horses and hauling more beets to the load, thereby reducing the number of trips to the factory, not only is less labor required but the hauling is finished before unfavorable fall weather.

SPARROWS DESTROYED IN UTAH

Several hundred thousand English sparrows, each eating six quarts of wheat a year, would mean a feed bill of more than $131,000. Therefore the killing of English sparrows means that amount of money saved for the farmers concerned. And nearly 700,000 sparrows were killed in a state wide campaign in which 783 Utah farmers joined forces to get rid of the pests during the winter months.

County agents helped in the campaign, which used 5,243 pounds of poisoned bait. In most cases the bait was made of wheat, poisoned with strychnine in accordance with a recipe sent out by the biological survey of the United States department of agriculture. It was put up in one-quarter pound paper bags in the county agent's office. Full instructions were printed on the bags for the use of the poison. Each cooperator receiving the bait agreed to report on the results. Usually the sparrows were enticed for a few days by putting unpoisoned bait in places not frequented by other birds and also inaccessible to the poultry of the farm. Then a few grains of poisoned wheat were put out each day. The dead sparrows were gathered up, counted, and either burned or buried every few days to prevent the sparrow population from becoming suspicious. The number of sparrows counted by each farmer was reported to the committeemen or the county agent at the end of the season's work.

As many as 240 dead sparrows were gathered up as the result of a single package of poisoned wheat. It is believed that where care was used in placing the poisoned bait an average of 75 sparrows was killed with each one-quarter pound package. In each of several counties, 50,000 to 100,000 sparrows were destroyed.

PAINT THE BUILDINGS

Paint is high—no question about that—but lumber is high, too, and it does not pay to allow the lumber in your buildings to decay from lack of paint. And it is not only the life of the building that is assured with paint, but the appearance is greatly improved. No wooden building looks completed until it has a good coating of paint.

A mistake is made in leaving a new building stand without paint because the article is so high at present. New lumber takes paint much better and while the surface is smooth it does not require as much paint as when the surface has become rough and cracked. Cheap paint is better than none, but it is only cheap at first cost, for in the end it becomes more costly than the higher priced paint. Cheap paint will not stay and soon the building is in need of attention.

Paint should not be applied to a building until the weather is warm enough that the oil will penetrate the wood. Boards to be painted should be smooth, clean and free from frost or grease. Oil will not penetrate where there is moisture or grease. And not only should buildings he painted, hut the wooden parts of all farm machinery should be protected by a good coat of paint.

It has been estimated that one gallon of good paint will cover 250 square feet in two coats, or almost 500 square feet with one coat.—Farmer's Guide.

SHE WANTED PROGRESS

"No, sar, Ah doan't neber ride on dem things," said an old colored lady, looking in on the merry-go-round. "Why, de other day I seen dat Rastus Johnson git on an' ride as much as a dollah's worth an' git off at the very same place he got on at, an' I sez to him, 'Rastus,' I sez, 'yo' spent yo' money, but whah yo' been?'"—Boston Transcript.

GYPSUM AND ALKALI

Extensive experiments at a government station in Italy have proven that the action of gypsum in improving alkaline soils is not a simple neutralization of the sodium carbonate, but rather a coagulation of the colloids and transformation into ahsorption compounds of calcium. This action is favored by the calcium sulphate of the gypsum, which is made more active by the presence of neutral sodium salts. In this connection it is the opinion that neutral salts themselves can indirectly hring about the same effect. Therefore, irrigation with salty waters is considered dangerous to the soil, hecause they will act on compounds containing absorption compounds of sodium. It is considered necessary to accompany such irrigation hy gypsum treatment.

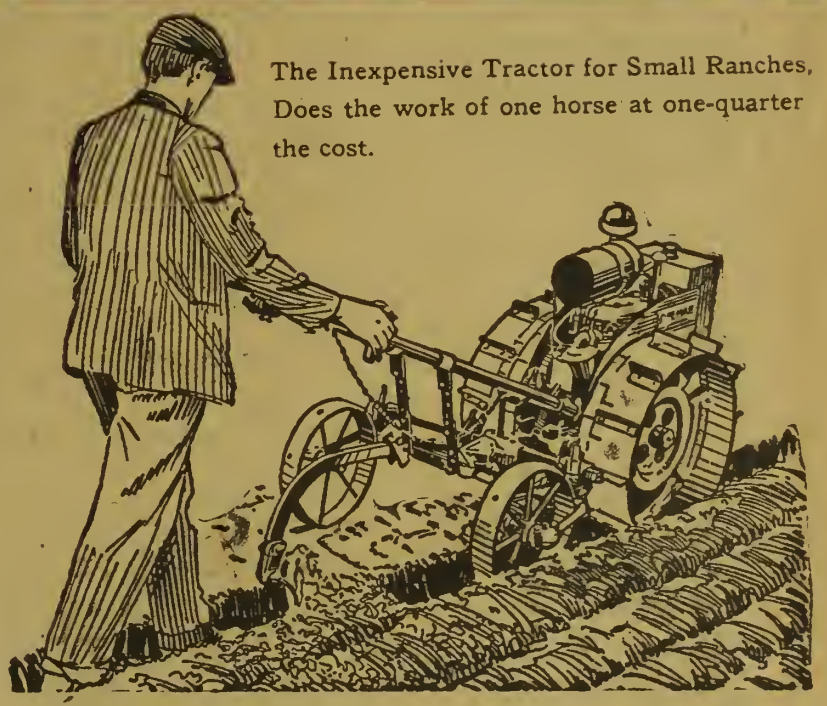
BEEMAN



The Inexpensive Tractor for Small Ranches, Does the work of one horse at one-quarter the cost.

Beeman Originated
The One-Horse Tractor

Now We Have the California Type
Made to Meet California Conditions

Beeman works all day on 2 gallons of gasoline and 1 quart of oil. It is simple, compact and so staunchly built that the upkeep cost is very small.

Beeman will do anything that any 4 H. P. engine will do: Operates the pump jack, buzz saw, feed grinder, churn, cream separator, washing machine, and is not only portable but is self-propelled as well.

Thousands of These Little Tractors Are in Use Today Giving Perfect Satisfaction

Peanuts as a Farm Crop

By H. F. Grinstead in Farm and Ranch

THE soil and climatic requirements of the peanut are similar to those of the sweet potato, and, like it, they do best in a warm sandy loam that is well drained.

The peanut belongs to the same botanical family as the pea and bean, and, in common with the other leguminous plants, has the power of collecting free nitrogen from the air. For this reason it is one of the most desirable of our soil improving plants when grown in rotation with other crops. The tops when cured are about equal to clover hay in feeding value, and it has been commonly estimated that the hay will usually pay the expense of cultivating a crop of peanuts, the yield being in the neighborhood of a ton to the acre.

Extremely fertile soil is not necessary, the mechanical condition of the soil being of more importance. Fresh manure should never be used, since it is likely to cause an abnormal growth of foliage. Soil that has been fairly well manured the previous season will be found suitable. The peanut will respond readily to commercial fertilizer. An application of 400 to 600 pounds of complete fertilizer to the acre will produce desirable results. Wood ashes is also one of the most desirable fertilizers when applied at the rate of half a ton to the acre. Land that is extremely wet or inclined to be sour will not grow peanuts unless treated liberally with lime. Almost any soil will be benefited by an application of 500 pounds of quicklime to the acre.

The preparation of the soil for peanuts should be thorough. If the land is flat it should be "bedded" by throwing up ridges and partially dragging them off, planting the seed on the flat ridge.

The seed should be planted when the ground is warm, which will usually follow corn planting from two to three weeks. The rows should be from 30 to 36 inches apart, depending on whether the small bunch varieties like the Spanish or the large Virginia are to be grown. Two seeds in a hill 12 to 16 inches apart will be the right distance in the row. There is little to be gained by shelling the seed, though the shelled seed may germinate two or three days earlier. It will be best to break the hull in two with the larger varieties, but with the Spanish this will not be necessary. It will hasten germination if the unshelled seed are soaked over night in warm water before planting. The seed should not be planted more than an inch deep on heavy soil, while on loose, sandy soil they may be covered to a depth of two inches. The method of planting will depend on the size of the patch, a one horse shovel plow and a hoe being the implements formerly used.

The cultivation of the peanut will be about the same as for corn, beans or potatoes, a small shoveled cultivator being used frequently to keep the soil loose and the weeds down. Some hoeing will usually be necessary. The old idea that the blossom must be covered with soil is not reliable, though the soil that falls over them at the last cultivation will do no harm. After the peanuts begin to "peg," or form pods, they should not be disturbed by further cultivation. A slight ridge around the plants will result if they have been properly cultivated.

The proper time to harvest peanuts is at a time when the vines have the greatest number of mature nuts on them. The peanut is a continuous bearer, like the cotton and tomato plants, and may have mature peas and new "pegs" on the same vine.

In the Southwest the earlier pods may begin to decay or sprout before the later ones are mature, but usually the best plan is to harvest the crop just before the first frost in the fall. Small crops will be harvested by loosening the soil with a fork and lifting the vine out with the pods adhering to the root. Larger areas can be loosenind with a plow or a potato digger. After the vines have been loosened from the ground they should be allowed to lie for a few hours till the leaves have wilted, then placed in small stacks around a central stake to cure. The essentials in curing are to put in small stacks and give free circulation of air. On account of the fleshy nature of the stem, the vines cure slowly and will mildew if in large stacks. A barn floor is not a suitable place for curing unless the crop is very small and can be spread out thinly.

The stakes around which the vines are to be stacked should be six or seven feet long, driven securely in the ground. Before the stack is started two pieces of lath or light lumber should be nailed at right angles to the stake six or eight inches from the ground, in order to keep the peanuts from coming in contact with the soil In building the stack, the pods are kept to the center and the tops outside, with sufficient slope to shed water. A few vines should be hung round the stake to tie the stack, and when the desired height is reached a cap of dry grass should be put on top. (In California staking or covering has never been practiced. Small "cocks" or piles have sufficed.)

The vines should remain stacked three or four weeks before picking. Like corn fodder, much strength will go from the vine into the nuts during the process of curing. If the picking is done by hand only the well filled and mature nuts should be picked off, the immature ones being left on the vines for stock feed. The work of picking may be done in the open or the vines can be hauled to the barn when cured and the picking done at any time that is convenient. Peanuts are easily discolored by mildew and should be kept dry at all times. There is now machinery for picking or threshing.

The vines, after the nut pods have been picked off, may be baled, stacked or put in the barn. The immature nuts and cured vines make excellent forage for stock, especially for milk cows, being the equal of clover or alfalfa.

The Spanish peanut has gained in favor of Southwestern farmers during recent years as a money crop. But the greatest usefulness of this crop is for livestock, especially for hogs. Farmers who have thin sandy land find the peanut almost indispensable as a crop on which to raise pigs and fatten porkers. An acre of peanuts on such land will produce more pork than an acre of any other crop on the same kind of land.

There are other soils than that described adapted to peanuts for pork In fact, most any soil is suitable if it has reasonable fertility, fair depth and does not bake or pack after every rain.

The advantages of growing a peanut crop to be grazed by hogs are many The peanuts are rich in feeding constituents, notably protein, the most essential feeding nutrient for pigs. Hogs will also eat the vines greedily as well as the nuts. They will feed themselves when they are turned on a peanut field, saving the farmer's labor and making rapid gains. With a little

Do You Know—

STANDARD PRACTICE

The use of Timken Tapered Roller Bearings at points of hard service in the great majority of motor vehicles is proof of leadership established on the tapered principle of design, quality of manufacture, performance on the road, and service to the automotive industry

that the thrust load put on the wheel bearings of a truck when it swings sharply around a corner is sometimes greater than the entire radial load on the bearings?

that the continual hammering of the load as the truck bangs over ruts, car tracks, and rough pavement imposes sudden, heavy loads on bearings that none but the best made can withstand?

that at most of the hard service bearing points the load put on the bearing is a combination of end thrust and radial load?

that this load must be carried, no matter what its force or direction?

that the Timken Tapered Roller Bearing is really two bearings in one, taking radial load and thrust load equally well, and that the tapered roller bearing is *the* type of bearing that will function properly under all possible combinations of the two?

TIMKEN BEARINGS

grain to finish porkers, the pork will harden and the animals will dress firm and prime.

It is an excellent plan to plant several small fields in peanuts at different times so the hogs may have grazing for as much of the time as possible. Planting may be done now in most localities of the Southwest. The season for the peanut extends to July or even a little later in some localities. Horses, cattle and sheep are also fond of peanuts. For work teams, few crops suitable to thin sandy land are equal to this legume. The vines are sometimes cut with mower and baled.

Experience With Grasshoppers

The North Platte Valley reclamation project had an experience with grasshoppers last year which may prove of value to grasshopper infested sections of this state. The Reclamation Record gives a most graphic story of their methods of work last year, from which we quote:

Investigations made early in the spring of the present year by Project Agricultural Agent Sheldon showed that millions of grasshopper eggs had been laid, and the indications were that they had come through the winter in good shape. Through the medium of the newspapers of the valley, posters mailed to farmers and schoolhouse meetings over the county, farmers were urged to cultivate or disk lateral and ditch banks, roadways and fields where grasshopper eggs were in evidence. All egg pods that were turned to the surface of the ground froze and dried up. A good many farmers responded and with good results which became evident as the season advanced, as those who did no cultivating had many more grasshoppers than those who cultivated.

In May young grasshoppers began to appear in such numbers that it was realized that some plan must be devised whereby the grasshoppers could be destroyed on a larger scale than had ever been done before. Fortunately the state legislature, through the efforts of Project Agent Sheldon, passed a pest law early in the spring and the counties of Scotts Bluff, Sioux and Morrill were formed into pest districts with pest inspectors in each district. It was the duty of the pest inspectors to see that poisoned bran was used where needed and in such quantities as would destroy the grasshoppers. With the machinery at hand for the enforcing of the poisoning of the grasshoppers it became necessary to devise some means of manufacturing the poisoned bran in large quantities. The counties had no funds for this purpose and it remained for the farmers irrigation district to take the initiative in the matter. The district accordingly proposed to the North Platte Valley Water Users Association to go in fifty-fifty on materials and cost of labor and put in five mixing plants, at Morrill, Mitchell, Scottsbluff, Minatare and Bayard. A contract was made between these two organizations. A large building was secured in each of the above named towns, and each plant was equipped with a concrete mixer run with a gasoline engine, a hot water heater, boiler and tank, etc. Each plant was in charge of a manager with as many helpers as were needed to mix the poison required from day to day. Arsenic was put in solution by boiling with sodium, and this liquid was put in a tank and crude molasses and anise oil added. Dry bran was placed in the mixer and enough poisoned liquid added to make it moist, and the ingredients were then thoroughly mixed and placed in sacks, 100 pounds to the sack.

The mixture was sold to farmers under the farmers irrigation district and water users association for $1.85 per hundred and to all others at $3.10 per hundred. The farmers irrigation district purchased three trucks and delivered the mixed poison to its water users. The demand soon became so great that the five plants were mixing an average of 50,000 pounds a day, and during the latter part of June some of the plants had to be kept running all night in order to keep up with the demand. Approximately 1,500,000 pounds of poison were mixed and used by the farmers. Twenty-five cars of bran were used, nearly two cars of arsenic, one and one-half cars of sal soda, $2,000 worth of anise oil, and $5,000 worth of low grade molasses. The total cost of materials and labor was approximately $60,000.

Nearly all farmers whose lands were infested with grasshoppers used the poison. Only one farmer was arrested and fined for not using poison when notified to do so by the pest inspector. Splendid results were obtained where the poisoned bran was used systematically and in quantity sufficient to cover areas affected. One farmer used a ton of the poisoned bran where the hoppers were so numerous that they threatened the loss of a large field of wheat. He estimates that he lost three bushels per acre of wheat that he could have saved if he had started earlier to spread the poison. A number of farmers saved fields of young alfalfa by using plenty of poisoned bran during the season.

CHILEAN WINE PALM

No doubt the hardiest palm we have in California is Jubaea spectabilis, the wine or honey palm of Chile, for it grows nearer the South Pole than any other species. It endures many degrees below the frost point and is splendidly drouth resistant. In California it makes rapid growth to majestic size as may be seen in our illustration. Though large specimens are yet rare, many hundreds of younger plants will soon make the honey palm a familiar sight in our landscape.

The trunk is the largest of any palm found in California and in its native land a full grown specimen will yield nearly 100 gallons of sugary sap, the tree being destroyed in the harvesting process. The sap is boiled by the Chileans into a thick syrup known to them as "Miel de Palma" or palm honey. From the sap is also fermented an intoxicating drink called palm wine. Both are common on the west coast of Chile and the honey is served in all hotels. The tree belongs to the coconut group, the nuts look like small coconuts and in the trade are called "coquitos," or "monkey's coconuts." The plant is of fine ornamental value and with age assumes a grandeur of appearance not equalled by any other palm known in California.—E. B.

Chilean Honey Palm

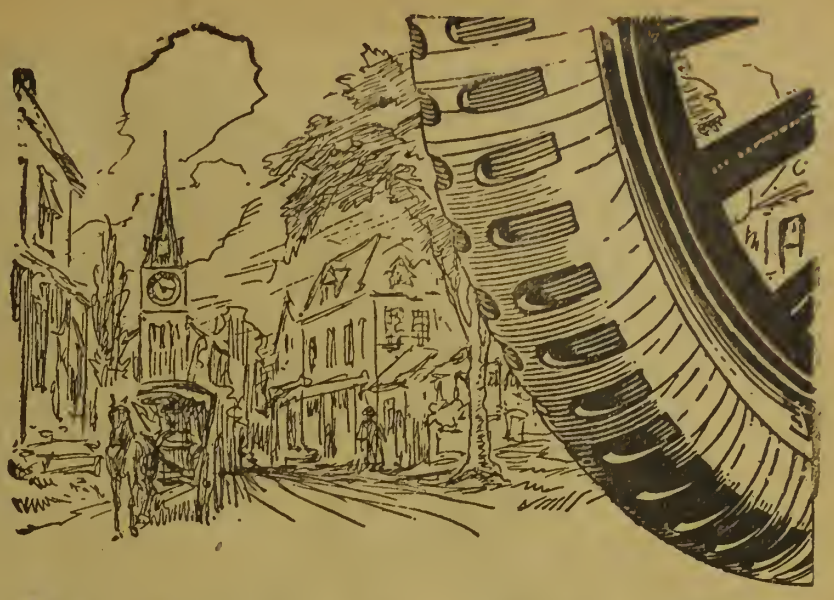
A DREAM—YET TRUE

(Continued from Cover Page.)

or eight dollars, and the price of the suit to the wearer is from $60 to $75. Who makes the money? Not the producer—really, it nearly all lodges between the sheep and the goat who wears the suit.

From one shearing of one sheep comes the wool to make a $50 suit, man's or woman's. Now the difference between $8 and $50 is scientifically, mathematically and exactly $42, and no joking, for figures will not lie, and the sheep raiser who has 1,000 sheep perhaps does not realize that his herd carries 2,000 suits of clothes a year on their backs at $50 to $75 a suit, as the sheep are sheared twice a year.

I would suggest that Mr. Sheepraiser effect a partnership with the manufacturer or the retailer, or both, as such a combination should make his sheep worth $100 a head, more or less.



Buy Sure Service

You can be sure of your rides only when you are sure of your tires.

Racine Tires—Multi-Mile Cord and Country Road Fabric—are Extra Tested to give you extra miles and real surety on all roads.

"Country Roads" for Country Rides

Plus their proved service quality Racine Tires have the industry's supreme mile-making achievement—Racine Absorbing Shock Strip. This extra strip of resilient rubber welds tread and carcass perfectly.

You will find tire economy begins with the purchase of your first Racine Tire. Be sure every tire you buy bears the name

Red Seal Dry Batteries

Avoid ignition troubles by using Red Seal Dry Batteries. These batteries are in reality convenient storehouses from which electric current can be drawn at will. They furnish fat, hot sparks that spur your tractor or farm engine into action and **keep it running at par.** Recommended as the most efficient, satisfactory and economical medium of ignition for all purposes.

The Guarantee Protects YOU!

Under every condition, regardless of weather, and no matter how rough the going, these famous batteries will supply you with reliable farm power at least cost. Thousands of tractor owners will use no other! Absolutely best for tractors, farm engines, autos, door bells, hand lanterns, telephones, etc. Study the label! Insist on genuine Red Seal Dry Batteries.

ASK YOUR DEALER

Under our plan, every dealer's supply of "Red Seals" is always fresh. No chance for you to get run down stock. Ask for them by name.

When you buy Red Seal Dry Batteries, ask your dealer for FREE book, "How to Run the Gas Engine" our famous handbook for engine owners.

Animals Destructive to Agriculture

By W. C. Jacobsen

ANIMALS destructive to agricultural interests must be placed in two classes; rodents and predatory animals. In the first class we must place house, meadow and field mice, house and kangaroo rats, ground squirrels, pocket gophers, jack and brush rabbits. In the latter class are coyotes, wild cats, and mountain lions.

The first class, of smaller animals, is, because of greater numbers, nearly a hundred times as destructive to agriculture as the second. A conservative estimate would place present losses to the farmers of California at $45,000,000. From the most reliable figures obtainable this would be divided as follows: Ground squirrels, $20,000,000; pocket gophers, $15,000,000; rabbits, $5,000,000; lesser rodents, $5,000,000; total for 1920 about $45,000,000.

Of losses from predatory animals actual figures are hard to obtain. The United States biological survey reported a few years ago that after a careful canvass of the state the loss in livestock, including poultry, was found to be about five per cent. But owing to systematic control through hunting, trapping and poisoning the loss has been reduced in Utah, Nevada and California to about 1.5 per cent. Figures for Utah, which are complete, show the loss of sheep alone to have been 500,000 head in 1915, while in 1919 it was but 75,000 head, the total saving in livestock and poultry amounting to more than $1,000,000 annually, in addition to the thousands of game animals, principally deer, that were saved from destruction. It is thought losses in California will compare favorably with those of Utah.

Methods of Control

Poisoning is not considered with favor in many localities because of loss of bounties. Bounty hunters will not think of using poison and it is without question one of the greatest means whereby the coyote and the bobcat can be thinned out. Every stock grower and most agriculturists should be interested in this manner of procedure. It would mean that hunters and trappers would be placed in the field and paid so that they could work the year round. Let us say that the following plan could be pursued:

Poisoning with the various approved baits at a time of the year when the normal food supply is scarce, and I might say that rodent control operations are depriving the coyotes and bobcats of normal food such as rabbits, squirrels, etc., so that they are looking for larger victims.

Den hunting at the time of the year when pups are coming on. It is not long before an experienced man becomes very proficient at this phase of predatory animal control.

During the balance of the year intensive hunting and trapping could be pushed. While it is true that a man must have had some experience to trap predatory aniamls successfully, nevertheless every one must have a start and with the improved methods that have been arrived at by years of successful work along this line by the federal government through their bureau of biological survey it is not a serious task to teach new men this work. The paid hunter and trapper can be stationed in a locality and carry the work far beyond the point that a bounty hunter would for he is being remunerated for his efforts. The biggest thing to look forward to in the systematic work is to have absolute cooperation of all the landowners in the region, and where funds are being expended in systematic control work there is no reason why the hunter should not have the unqualified support of all concerned and in most instances this has been readily granted.

Overland
TRADE MARK REG.

Built for All Roads

THE new Overland with the wonderful *Triplex* Springs is an ideal car for any up-to-date farmer to own.

It is a handsome car in which you and your family will take pride. Its black enamel finish is baked on. You can drive the car through the mud and when you wash it off, your car looks like new.

The Overland is built for all roads—for all kinds of driving, in any weather.

The radical new *Triplex* Springs cushion the road shocks and the bumps, protecting not only the driver but the mechanism of the car as well.

* * *

ALTHOUGH the protection of *Triplex* Springs made it possible to build this car light in weight, the quality of material is so high, and every part is so properly harmonized and so exactly balanced, that the Overland has exceptional stamina.

Its low upkeep cost not only includes high mileage per gallon of gasoline, but an almost negligible expense for mechanical upkeep.

You will find this car, with only 100-inch wheelbase, handy for driving anywhere. You can turn it in a narrow road or park it, when you go to town, in a very small space. Yet because of the *Triplex* Springs it has 130-inch springbase, which gives it the riding comfort of a big, heavy, expensive car.

* * *

BESIDES these great advantages, the Overland has many advantages of convenience, many little things which make it an exceptionally good car for all-around use.

The upholstery, for example, is removable, either in the front or rear section of the car. Thus you can use the car also for other purposes than passenger use.

The equipment is complete from Auto-Lite starting and lighting, to the rain-vision windshield. It is a car you ought to own. Go and take a ride in it.

Sulphur as a Fertilizer

By D. A. Brodie

WHAT should be of special interest to alfalfa growers generally is the recently acquired knowledge of the use of sulphur as a fertilizer.

It has long been known that sulphur is a constituent part of all protein matter, but the amount of sulphur required by plants has been greatly underestimated until a very few years ago. This was due to the method used in determining the chemical constituents of plants. When we were in college we were taught that the first step in the analysis of a plant was to burn it and analyze the ashes, the assumption being that the mineral elements remained in the ashes. As a result there was only a very small amount of sulphur found, and it was therefore classed with iron, calcium, magnesium, sodium, chlorine and silicon as being essential to life of the plant, and thought there was an inexhaustible amount in the soil to meet this need, and that therefore it was not necessary to supply these materials as in the case of nitrogen phosphorus and potash. However, in 1902 Dr. G. S. Trapps, now of the Texas experiment station, but formery with the North Carolina experiment station, made the discovery that oats, cowpeas, corn and peanuts contained more sulphur than could be recovered in the ashes of these plants. These results have been amply verified since that time by other investigators. It is now known that the legumes such as alfalfa, clover, beans, etc., as well as cabbage, kale, turnips and kindred crops are particularly rich in sulphur. In short, in the old burning process, most of the sulphur that was in the tissues of the plant was driven off in the form of gas. This loss has been found to be as high as 90 per cent of the sulphur in the plant. Prof. O. M. Shedd of Kentucky experiment station, Bulletin No. 74, page 244, makes the following statements after a careful analysis of the principal soils of that state:

"A large majority of soils contains much less sulphur than phosphorus. Some crops contain considerably larger amounts of sulphur than phosphorus.

"The amounts of sulphur removed from the soil by the average crop, although in some cases somewhat less, still compare very favorably with the phosphorus.

"If the above is true, then we must admit that sulphur should be ranked along with phosphorus, potassium and nitrogen as one of the chief or limiting elements, etc."

More recent work in other states has strengthened these statements. In fact, it has been fully demonstrated that sulphur is the limiting element in some soils. The most conspicuous example of this is found in the recent work of Dr. F. C. Reimer, published in Bulletin No. 163 of the Oregon experiment station. In summarizing the results of his work Dr. Reimer says in part:

"In general fertilizer experiments conducted by the Southern Oregon branch experiment station during 1912-13 superphosphate (about 16 per cent sulphur) and gypsum (about 18 per cent sulphur) produced a marked increase in the yield of alfalfa, and a much darker color, while rock phosphate had no effect whatever.

"In an experiment during 1914 flowers of sulphur (pure sulphur), iron sulphate (21 per cent sulphur), and superphosphate (16 per cent sulphur) each produced an increase of fully 100 per cent in yield of alfalfa, and greatly improved the color of the plants. Rock phosphate in the same field had no influence.

"Experiments conducted in 1915 to 1918 inclusive on various types of soils showed that the alfalfa and clover crop can be increased from 50 to 1,000 per cent on many soils by the use of various fertilizers containing sulphur. These soils include very diverse types ranging from the coarse granite soils to the heaviest adobes.

"On these soils applications of nitrate of soda, moncalcic phosphate, muriate of potash and lime have had little or no effect on alfalfa. It is apparent from this that the beneficial results obtained from the various sulphur fertilizers cannot be attributed to any extent to any effect such fertilizers may have in liberating phosphorus, potassium or lime in the soil, or to nitrification.

"None of these soils are acid, and none contain noticeable amounts of alkali.

"Analyses made of the alfalfa plant grown under local conditions from fertilized and unfertilized plots show that the fertilized plants contain more sulphur, more protein and more nitrogen than the unfertilized plants. The amount of sulphur in alfalfa hay from fertilized vigorous plants varied from 3.34 to 4.54 pounds of sulphur per ton, while the amount from the unfertilized plots varied from 2.36 to 2.54 pounds of sulphur per ton."

However, it is not to be expected that the results obtained in Southern Oregon can be obtained everywhere. In fact, some actual tests have been made in which sulphur had no effect, which is simply evidence that in one case sulphur is the limiting element while in the other case it is not. On the other hand it is not likely that the Southern Oregon soils are the only soils in which sulphur is the limiting element.

In this we may be guided to some extent by a comparison of the sulphur content of the Southern Oregon soils with that of others, for example:

Table I

Shows the percentage of lime, phosphorus and sulphur in Southern Oregon soils as compared with the same elements in certain other soils.

Locality	Lime	Phos phorus	Sulphur	Result of Experiments With Sulphur	Authority
Southern Oregon...	2.23	.058	.028	Increase 50 to 1,000 per cent	Oregon Bul., 163, page 38
Southern Idaho ...	4.53	.170	.023	Improved with Gypsum	Idaho Bul. 114, page 11
Palouse soils.....	2.32	.265	Trace	Yields doubled by using Gypsum	H. H. Curtis Farm, Pullman Wash.
Arlington, Cal.....	1.57	.170	.010	No data	Hilgard
Riverside Co.,					

At the outset it should be borne in mind that chemical analyses of soils are at best only indicative of the actual conditions. However, these figures represent averages of a considerable number of analyses from each locality, and are worthy of consideration. Furthermore, they are all we have to guide us in the matter of soil improvement along lines as yet untried.

According to Table I, the Southern Oregon soils already contain a greater percentage of sulphur than either of the others, especially the Palouse soils which show only a trace. Logically, it might be inferred that the other soils were each in greater need of sulphur than the Oregon soils are, and judging from the data now available there is no good reason to conclude that sulphur in some form would not be beneficial in the localities mentioned.

On the other hand, a comparison of the phosphorus content of the soils shown in Table I shows that the Oregon soils have less phosphorus than either of the others, yet the addition of phosphorus, without sulphur, had no apparent effect. This would indicate that the available phosphorus already in the Oregon soil is sufficient for present needs. Presumably this is true of the others with their greater total phosphorus content.

Since Oregon Bulletin 163 appeared equally promising, reports have been secured from a number of other sections; among these are:

The county agriculturist of Union County, Oregon, reports gains in yields of alfalfa of two tons per acre at a cost of less than a dollar per ton.

The county agriculturist of Lake County, Oregon, reports that during the past five years sulphur trials on alfalfa have doubled the yields in the Goose Lake Valley.

The county agriculturist from Klamath County reports increased yields of alfalfa averaging two tons per acre by the use of sulphur.

In California the county farm adviser of Mendocino County is reported to have secured increased yields of alfalfa ranging from 11 to 60 per cent.

In the Palouse hills of Eastern Washington H. H. Curtis, who owns a large dairy farm near Pullman, has more than doubled the total yield of alfalfa on his farm by the use of gypsum.

All of these examples are in the drier portions of the states mentioned, and represent both irrigated and non-irrigated sections. The experiments described in Oregon Bulletin 163 were conducted on non-irrigated land, and where the rainfall averages about 16 inches annually. These soils are all apparently well supplied with lime, which is a very important matter where sulphur is concerned. The reason for this is that when sulphur in the pure state is applied to the soil it must be converted into a soluble form before the plants can use it. In the same way that nitrogen is not available as plant food until it is converted into nitrates, so sulphur is not available until it is converted into sulphates. In going through this process of oxidation, as it is called, it tends to make the soil acid, unless there is sufficient lime in the soil to keep it neutral. A good illustration of this is found in the Willamette Valley in Oregon. There the rainfall is comparatively heavy and soil analyses show that the lime content is low because as the lime in the soil becomes soluble it gradually disappears either by being taken off in the harvested crops or by leaching. Hilgard offers the following comparison between Western and Eastern Oregon soils:

TABLE II

Locality	Lime	Phosphorus	Sulphur
West of Cascades.	.83	.23	.16
East of Cascades..	1.23	.11	Trace

Experiments made with pure sulphur in the Willamette Valley have not given satisfactory results, and the low lime content may be in a large measure responsible for it. In other words, the soil is already inclined to be acid and the addition of more acid forming material, such as sulphur, tends to render it still more acid. On the other hand, gypsum has long been known to have beneficial effects on some Willamette Valley soils, but for some reason its good effect seemed to disappear after a few applications. This may be explained, in part at least, by the fact that gypsum carries about 23 per cent of lime. This amount of lime in a slightly acid soil will neutralize some of the acid, but the amount is too small, i. e., the quantity applied with gypsum is not sufficient to keep on neutralizing the increasing acidity which the 19 per cent of sulphur also carried by the gypsum tends to make more acute. Under such conditions the apparent remedy is to apply more lime. In fact, we have some evidence where elemental sulphur applied to acid soils, with an excess of quicklime or air slaked lime, has given highly satisfactory results.

Insofar as it has been used sulphur in any of the elemental forms is used at the rate of 100 pounds per acre. This, Dr. Reimer believes, is the optimum amount for the first application. The effect lasts about three years when another application should be made; this time using about 50 pounds per acre.

It is applied in the same way that lime is applied by scattering broadcast on the surface, either by hand or with a land plaster sower.

The sulphur may also be mixed with an equal amount of damp sand, which tends to hold the particles together and prevents their being blown away, and it also makes it less disagreeable to handle.

Sulphur has been applied immediately after the first cutting in the irrigated sections with immediate effect. In non-irrigated sections this may not be advisable unless there is sufficient moisture in the soil to aid oxidation.

After reviewing the consistently good results obtained from the use of sulphur as a direct fertilizer in all parts of Oregon, it would seem to be worth while to give the matter careful consideration and trial in other alfalfa growing sections. It is not quite reasonable to conclude that Oregon soils and conditions are different from those of other sections. Certainly there is not likely to be as great difference in the conditions existing between the north and south side of the Oregon-California line in the vicinity of Goose Lake, as between the conditions of the Rogue River Valley in Southern Oregon and the Grand Ronde Valley in the northeastern corner of the state. In other words, it's a pretty safe bet that what has brought the alfalfa growers of Oregon hundreds of thousands of dollars in increased revenue will do the same thing for other sections, if an open-minded attitude is adopted until sulphur is given a fair and impartial trial in each locality.

Agricultural News Notes of the Pacific Coast

Northern California

The Glenn County farm bureau is erecting a saw miil on Elk Creek.

Trinity, Lassen and Shasta national forests were open for grazing on May 1.

Sutter basin expects to ship 400 carloads of watermeions and cantaloupes this season.

The Ehmann Olive Company has set out 500 young oiive trees at Olinda, Shasta County.

Petaluma, "the worlds' egg basket," is now excited over discovery of oil in the hills near the town.

The cattle experiment range in El Dorado County is aiready being put in shape by the state university.

Placer County farm bureau has organized wool growers and will ship through the state wool growers association.

The Eidorado farm bureau auction committee has postponed the livestock auction, scheduled for May 5, until early June.

Farmers of the Sutter Basin district, comprising some 50,000 acres, have decided to dispense entirely with Orientai labor.

The California Oriental Exclusion League is taking steps to bring about legislation prohibiting the leasing of lands to Orientals.

Last season's hops are now being cleaned up at $1.00 per pound with 75 to 80 cents being offered for the crop now starting to grow.

Almond growers of Butte County met at Chico recently and were addressed by President George Pierce and Manager Tucker.

Coiusa reports its first full carlot shipment of peas, to Eastern markets. It is expected that there will soon be shipped one car every day.

The Tehama County Fair Association has been organized with the object of holding two annual events, a fair in the fall and a rodeo in the spring.

Farm Adviser Hoffman has been appointed assistant to Manager Scott of the California Nurserymen's Bud Selection Association. Mr. Hoffman begins his new work on July 1.

The recent good news from Iron Canyon dam site is renewing hopes that the $20,000,000 expenditure will soon be made by government and state to impound a great body of water.

The malarial situation in Shasta County has been taken in hand by the farm bureau and some most effective work in drainage and oiling has greatly reduced the mosquito pest.

Placer County farm bureau meetings: Mt. Vernon Center, May 22; Roseville, 24; Colfax, 26; Forest Hill and Butcher Ranch, 28; Allen, at Excelsior School House, 21; all meetings at 8 P. M.

It is now anticipated that the 1920 almond crop will bring a much higher price than last year. There is a materlal shortage because of drouth and frost which affected many of the best almond producing sections.

The Califonia state board of forestry is appealing for protection of water sheds and greater care in fire protection. Elghty-two per cent of last season's $300,000 hay and grain ioss occurred in May, June and July.

Central California

A farm bureau center was organized at Terra Belia, Tulare County.

There are 600 cows, members of cow testing associations of Monterey County.

San Luis Obispo County has planted thls season over 800,000 almond trees.

The farm bureau of Clovis, Fresno County, is discussing the formation of an irrigation district.

The Modesto County cow testing department of the farm bureau wants 500 more cows on its list.

The Santa Cruz County farm bureau holds its annual picnic Saturday, May 29, at New Brighton Beach.

The California Prune and Apricot Growers have commenced construction of a new packing plant at Reedley.

Tracy, San Joaquin County, is developing into a large shipper of lettuce to the San Francisco market.

The Stanislaus County Farmers Union held a big picnic iast week at the Shruder Young grove west of Modesto.

Tulare is maintaining a free employment bureau through which men are supplied to fruit growers and ranchers.

County Horticultural Commissioner Hickman of Monterey is recommending the use of a weak Bordeaux for apricot blight.

Five cars of fat hogs were sold at auction by the California farm bureau marketing association, $15.85 being top price and $12.90, low price.

A pure bred hog auction was heid in Bakersfield on May 15 when the Kern County union high school boys agricultural club offered 60 head.

Farm center meetings will be held in Kern County, Mountain View May 17, Old River 18, Pond 19, Rosedale 21, Inyokern 24. Shafter 26, Arvin 28.

The Stanislaus County Farmers Union has appointed a committee to draft a pure seed iaw to be presented at the next session of the legislature.

The Tulare Cooperative Poultry Association paid to members 38 cents for No. 1 and 35 cents for No. 2 eggs April delivery. These were higher than prices for March.

The California farm bureau marketing association announces auction sales in Kern County: Wasco June 5, McFarland 12, Bakersfield 19, Wasco July 3, McFarland 10, Bakersfieid 17.

Farmers and fruit growers and members of the chamber of commerce of San Jose are uniting in planning out and financing some system of conservation of the waters of the mountain streams.

The Valley Growers Association with headquarters at Fresno is using every effort to secure sufficient help. It is now thought that there will be no difficulty in having sufficient supply before harvesting time.

Recent seizure in San Francisco of berries shipped by the Central California Berry Growers Association are said by President Eaton of the association to be due to the fact that the standard box for berries was chosen late in the season when the sugar content was high and that now a full box of berries can be brought up to required weight only by using very small berries.

Southern California

Imperial Valley has a five headed barley.

The lima bean planting season is well advanced.

The harvesting of Washington Navels is practically over.

A large acreage of beets has been planted at Hansen, Orange County.

Orange County expects to have little more than a 60 per cent apricot crop.

The Alfaifa Growers of California will build a warehouse at Los Angeles.

Pomona reports exceptionally heavy setting of Navel oranges for 1921 crop.

Cotton growers of Coachella Valley are meeting and planning for supply of labor.

Several thousand acres of land in the Chino hills is to be divided into small farms.

Horticulturai Commissioner Coy of Orange County, estimates a 100 per cent crop this year.

Owing to closing the border at Calexico cotton growers are concerned as to securing labor.

The Southwest Cotton Company promises to build new gins at Brawley, Imperial and Calexico.

Imperial Valley is now discussing advisability of cutting the one great irrigation district into two.

Riverside County cow testing association reports 25 cows better than 50 pounds during April testing.

Riverside County beekeepers are protesting importation into their county from disease infected sections.

The Goodyear Tire and Rubber Company is establishing a $50,000 cotton gin at Calexico, Imperiai County.

Several plantings of Durango cotton have been made in the Perris and Elsinore districts of Riverside County.

Prof. Nelson of the state university is holding soil demonstrations in conjunction with various county farm bureaus.

The National Milk Goat Association proposes to make a large exhibit of milk goats and products at the Riverside fair.

County Horticultural Commissioner Coy of Orange County, says an unusually large planting is being made of deciduous fruits.

Experimentai planting of an acre of dates has been made at Blythe by Bruce Drummond of the government experiment station.

Lima bean growers are pleased over present situation, and it is now hoped the local warehouses will soon be cleared of holdover stock.

Fruit Growers Supply Company has asked permission to increase its capitalization in order to purchase large timber section in Lassen County.

The Caiifornia Lima Bean Growers Association is making a survey in Ventura and Orange Counties to ascertain the exact acreage planted to limas.

"How to keep the boy on the farm" was the theme of most of the addresses at the annual picnic of the Orange County farm bureau at County Park.

The Santa Paula Chronicle says that many Ventura County growers and housewives will dry their fruit this year instead of canning because of the prohibitive price of sugar.

The Coast and General

Union livestock show at Union, Oregon, June 2-4.

Three men in Chicago factory have died of anthrax.

Arizona cotton fields are reported to be infested with "sore shin."

Yakima Valley, Washington, now has over 2,000,000 apple trees.

Roseburg, Oregon, will hold its annual strawberry festival May 27-28.

Washington state federation of farm bureaus met at Ellensburg on May 7.

Arizona farm bureaus held 162 farm demonstrations during the past year.

Yakima, Washington, is using its state fair grounds for a tourist camp site.

Oregon has a state fish hatchery just building on Stout Creek near Mohama.

The cannery at Ashland, Oregon had a total pack last year valued at $40,000.

Dairymen at Tucson, Arizona, have formed a cooperative milk producers association.

Walla Walla, Washington, observes an entire week as Blossom Week early in May.

Whatcom County Beekeepers Association will meet at Ferndale, Washington, June 8.

The first carload of rhubarb from Walla Walla, Washington, was shipped on April 11.

The Whatcom County, Washington Beekeepers Association will meet at Ferndale, June 8.

Texas is shipping heavily of Crystal Wax onions to Chicago. They are jobbing around $3.40.

Clarke County, Washington, is organizing cooperative buying and selling agencies for farmers.

Sale was recentiy made of 300 tons of number one potatoes at Yakima, Washington, at $125 per ton.

Ten community branches of the Walla Walla, Washington, farm bureau have been organized this spring.

The Wenatchee fruit growing district of Washington will pay out over $4,000,000 for boxes, paper and nails.

The Skagit County, Washington dairymen's association is erecting a $300,000 utility plant at Burlington.

Farm bureaus of the state of Washington are holding demonstrations in sheep shearing and the care of lambs.

Twenty thousand acres of cotton will be planted in the Cibola Valley on Arizona side near Blythe, California.

The biggest deal yet reported in Arizona Pima cotton is the sale of a pool of 1,252 bales consigned by the cotton exchange at Tempe.

The convention of the National Wheat Growers, which met at Kansas City, April 21-23, adopted a comprehensive cooperative marketing scheme.

Increased cost of fruit boxes this year will force fruit growers of the Yakima Valley of Washington, to pay at least $1,000,000 more for boxes this season than last.

A meeting of farmers at Chicago recently recommended the formation of an internationai farmers board in large part to secure better cooperation of American and Canadian farmers.

"Hog Wallows"

By Gordon Surr

CERTAIN areas of California and elsewhere have a pronounced so-called "hog wallow" topography, with symmetrical mounds up to three feet in height and from ten to 20 or more feet in diameter. Pronounced hog wallows are found only on the older soils and are therefore apparently evidences of age, as are true hardpans and relatively heavy subsoils. Naturally these mounds excite interest, and all sorts of ideas, fantastic and otherwise, have been advanced to account for their formation.

Apparently neither hogs, ground hogs, hedge hogs nor road hogs have had a thing to do with these hog wallows, nor are they the work of mound builders, for, as far as I know, human skeletons or antiquities of any kind have never been found in the mounds.

Some have thought that the mounds were formed by water in some mysterious fashion, but as a matter of fact strata laid down under water commonly have very even surfaces, as shales, sandstones and other stratified rocks plainly show. Further, the dry lake basins of the desert regions of California and the shores of the present Salton Sea are good evidences that receding waters are not apt to leave mounds like these in their wake. Torrential rains may cut deep gullies but do not give rise to this kind of a surface.

Contraction and expansion have been suggested as the causes of hog wallows. Compression of the crust of the earth results in such things as folds, arches and troughs in the strata, also ridges, mountain ranges, structural valleys and thrust faults, while the tension due to expansion is relieved by normal faults. Moreover, some hog wallow land adjoins ground with a smooth surface, yet presumably both have been exposed to the same forces and to the same degree of heat and cold. This idea seems akin to the notion of the school boy who stated that the days are longer in summer than in winter because heat expands and cold contracts. It is true that in some cases low mounds and ridges are formed owing to the filling of cracks in dry ground with soil, through the agencies of showers and winds, and when heavy rains later soak the land some upward bulging may occur in places. This, however, is on a very small scale compared to the typical hog wallows, the bulging amounting at most to but a few inches above the surface.

Then the expansion due to the hydration and crystallization of salts beneath the surface has been advanced to account for the forcing up of the mounds. This explanation may apply in part to certain large salt and gypsum domes, which are thought to have been supplied with salts brought up in solution through fractures in the crust of the earth. The famous "Spindletop" oil well at Beaumont, Texas, was put down, by the way, in one of these domes. But it is very difficult to understand how concentrations of salts got located in the first place under each one of the thousands of hog wallow mounds, being much harder to explain than the mounds themselves. This theory will here be left severely alone until a satisfactory explanation is forthcoming from its advocates for such a truly remarkable state of affairs.

Explanation due to the freezing of water in the soil has also been suggested as a possible cause, in spite of the fact that certain mounds are in districts said to be entirely frostless by some individuals with land for sale. Here again it is pertinent to inquire why ground with a smooth surface, in colder locations and adjoining hog wallows, is not likewise affected by the frost.

Holes, due to the work of animals, are common in many mounds and it has even been suggested that the mounds have been bulged up by gas which later made holes in escaping.

Certain termites, or "white ants," build high mounds, such insects, however, being unknown in the United States.

It is a common sight in arid regions to see mounds of soil and sand heaped up against bushes or other obstructions by the winds, to say nothing of sand dunes on the coast and elsewhere, which are also evidently due to wind action. Furthermore, in many localities bushes and plants may be seen growing naturally, which are quite as evenly spaced as are these hog wallow mounds. In the first place, even a small bush would serve to hold a little pile of soil blown against it by wind. Then with the coming of rain the soil would be moistened and vegetation might spring up under suitable conditions and thus assist in holding the mound together. The wind would move chiefly the finer or richer particles, for the smaller the grains of a soil the more available is the plant food in general. Such a process might be repeated year after year, the mounds thereby gradually growing in size. Another factor comes into play, beside moisture and vegetation, in holding together and slowing down the wind action. The feldspars and certain other soil minerals form clays in weathering, the soil therefore becoming heavier until finally the wind has little further effect. In one locality in Southern California nearly all the soil is in the mounds, bedrock being within a few inches of the surface in the depressions. Here the mounds evidently kept growing until the supply of soil practically ran out, and in other cases the quantity of soil which the wind can move has been exhausted and not the total amount. In short, a small plant or bush, or a little pile of earth thrown up by a squirrel or gopher, may serve to start a mound, which is held in place by later vegetation or by the binding action of moistened clayey or other cementing materials, or by both, the mound gradually growing, season by season, until growth ceases from lack of movable material. Furthermore, in certain cases the mounds may be to some extent residual, the soil, where not held by the roots of bushes, having been blown away. Thus a bush would tend not only to collect soil but also to hold what was around it in the first place.

Typical Hog Wallow Land

Wallows near Lindcove, Tulare County. Photo taken one week after rain.—Photo by Cole.

When the mounds have stopped growing, the tendency is for them literally to go down hill, as the weathering agencies ever at work make for the gradual leveling of the earth's surface. In the process a rounding, smoothing action takes place, both on mounds and on mountains, which doubtless accounts in part for the symmetry of many hog wallow mounds. The rains beat upon the mounds and carry the finer particles into the depressions, and water may likewise lie in the hollows and still further puddle the soil (see photo), so that it is now common to find the heavier, more clayey soil in the depressions and the lighter, more open soil in the mounds. Squirrels and other animals generally select the mounds for their habitations, possibly on account of easier digging, the danger of being drowned out in the hollows, and a better view of approaching enemies, rather than of scenery in general. In some cases the soil brought to the surface by animals keeps the mounds more or less up to size, and in other cases the mounds themselves are apparently very largely the work of animals. In one such instance of the last kind the mounds all fell in after a very wet winter, but this is decidedly unusual, as a good grading outfit is generally required to get rid of them.

Large stones are not moved by wind and most mounds are free from stones of any size, but not only do animals bring stones to the surface, but stones in mounds may also be those which were originally present in the soil around the bushes where the soil not held by the roots of the bushes has been blown away. Hence stony mounds would be residual rather than mounds which have been built up, the winds being responsible in either case for their formation.

Sand dunes are continually on the move because little or no vegetation grows upon them to hold them in place and there is no binding action from the presence of cementing materials, including clay, which last also holds moisture and thus promotes the growth of vegetation. Probably for the same reasons pronounced hog wallows are not seen on very sandy soils. Many fields, although worked up into excellent tilth, bake hard on the surface after wetting and drying, and rather a nice balance seems to be required for the formation of pronounced hog wallows. Apparently enough cementing and clayey material should be present to hold moisture, promote the growth of vegetation and exert a binding action, but not sufficient clay to make the soil so stiff and hard when dry that the wind has no effect. The significant features here are that hog wallows belong essentially to the older soils and that the proportions of clay and substances of like nature in a soil tend to increase with its age, owing to the breaking down of various minerals. The necessity for a nice balance is shown in many other cases. Take, for instance, this old world upon which we move and have our being. Were the earth somewhat smaller it would not hold much of an atmosphere, and even now hydrogen is probably escaping into space from the upper air.

Those who doubt the power of wind to move soil particles need not go far to have their doubts completely removed. For example, near Palm Springs Station on the Southern Pacific Railway, close to the western rim of the Colorado Desert, boulders of solid granite may be seen with grooved surfaces and a sort of worm eaten appearance on the exposed portions, due to the action of the sand blasts, while the telegraph poles look as though animals had gnawed them. Chamberlain and Salisbury, in their fine work on geology, remark: "It would perhaps be an exaggeration to say that every square mile of land surface contains particles of dust brought to it by the wind from every other square mile, but such a statement would probably involve much less exaggeration than might at first be supposed."

Suffice it to say in closing that far fetched, fantastic, outlandish explanations should be considered only when all the possible simple causes have been carefully weighed and found wanting. This is particularly true in the study of geology, where little everyday occurrences count far more than upheavals, blowouts and terrific convulsions of nature, commonly associated with the science in the popular mind.

Horticultural and Agricultural Legislation

LAWS of California affecting horticulture and agriculture have been more or less at cross purposes. Every session of the state legislature has seen their betterment in some way. Amendments and amendments to amendments have been made until there is more or less of confusion, still not the effectiveness desired. At the convention of farmers and fruit growers held at Chico in November it was suggested that there be a revision of the horticultural laws. The suggestion was soon amended so as to cover agricultural laws as well. That the revision might be as complete and result in the greatest encouragement to agriculture, it was decided that a large representative committee should be formed with delegates or rather a membership from every branch of productive industry.

Instead of naming this committee from the floor of the convention or making it of representative individuals from various parts of the state it was deemed wiser to appeal to various representative cooperative market-

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

OUR DAILY BREAD

"Give us this day our daily bread." We, the people of the United States, are most devoutly uttering "Give us this day our daily bread." Not only this day, but we are getting somewhat concerned about tomorrow. Department crop estimates indicate a fearful shrinkage in production. The Labor Union has been exceedingly successful in boosting wages and in not boosting hours of service. This has been so alluring a program that when the boys came home they failed to see the attractiveness of the old farm. They are now engaged in building ships, tending lathes, selling satins or drawing soda water, and at a wage beyond dad's capacity to give. Why should they return to the farm? Which compels the farmer to say: "Why should I try to produce increasing quantities of food?"

BE IT RESOLVED

"We, the consumers," can, however, very nicely arrange the whole matter. For instance, here is a suggestion from one who apparently has had his entire farming experience from car window observation: "There are thousands of acres of the finest land on which the California sun shines that fairly yawn to be possessed by men and women with only courage enough to try."

Yet there have been women and men who have tried California farming with no knowledge whatever of farming, but a courage which was simply sublime. The wreckage left by this type of farmer litters the sides of the foothills and valleys of the state.

Again: "There is today need for a strong urge behind this necessity for attracting the dependable farmer to the farm. Where is our modern Moses?"

The answer is almost deafening, for there are thousands anxious to play Moses. Unfortunately the Joshuas are not so numerous. Leadership which means wandering in the wilderness for another 40 years falls short of present day needs. In fact, the advice, the comfort and even the leadership which the non-producer is anxious to give to the producer today is not being received with very good grace. The farmer knows that the "strong urge behind" is simply the suggestion of selfishness of the consumer or, worse, of the handler of the produce of the farm, who would, in a few hours, make more from the products of the land than does the farmer who toils months, or perhaps years, to produce his crop.

The farmer recalls how during the war he was appealed to to produce to the limit. He responded with patriotism surpassed by none. The price which should be paid to him was named, at least on some of his products, by the government, and this price was little better—in the case of wheat at least—than 50 per cent of that which prevailed before the price was named. Yet he did not grumble, but produced to the limit. But when action was taken which did favor the shipbuilder, the steel manufacturer, and more particularly the laboring classes, this often to the detriment of the farmer, he felt there was discrimination most unjust.

CAN'T EVEN COOPERATE

Does the farmer cooperate to in a measure overcome the advantage which the middleman has over him? Then he is haled to Washington and compelled to give reason why he should not be punished for organizing a farmers' trust.

WHAT DOES FARMER WANT?

The farmer does not ask, nor want, any favors. If he has a bushel of wheat, a pound of walnuts or a quart of milk, he would like the privilege of making sale without discrimination and without working under an enactment of state and federal legislation which forces him to accept dictation. In other words, the farmer wants a fair show and not a "strong urge behind."

WONDERFUL RICHES

We write this week's editorials in the midst of confusion, for the bands are playing, automobiles and tractors are honking, electric bells are ringing, and the populace is shouting—the parade is passing. It began at one; it is now nearly three, and the end is not in sight. The Queen of the Angels is decked in her prettiest and is saying to the world: "Look at me and at my wares." It is Industrial Day, in fact, Industrial Week, in Los Angeles. The hundreds, we may even—and more correctly—say thousands of factories of a great city have put their wares on tractor propelled trailers, on great trucks, and even on tiny floats, and are making a wonderful showing. There are exhibits of all kinds of foodstuffs, seeds and plants, genuine Pacific Coast made furniture, including mattresses, rugs, curtains and shades, everything that goes to make the home homey. There are even piled high on trucks a complete residence, ready cut, which may be put up in a very few days by the ingenious saw and hammer carpenter. There are great ingots and steel shaftings requiring two trailers to carry, the like of which it was thought could hardly be produced this side of Pittsburg. There are automobiles, trucks, tractors, plows, harrows, spray pumps, orchard heaters, all imaginable appliances for orchards or for farms.

The merest list of the things which are passing along the streets of Los Angeles today would fill this entire page. Possibly the city is boasting a bit. If it is, it is justified, for it is so short a time since it was said that it was a city of climate and horned toads. The discovery of oil within its very borders and the use of it and the combination of it with labor, capital and brains is the reason for this great city becoming such a great factor in the upbuilding of the Pacific Coast. This wonderful growth is to the advantage of every producer of fruits, vegetables, staple foods or livestock on the Pacific Coast, and it gives to the onlooker an idea of the wonderful market at the California farmer's own door.

HOMER HAMLIN

The reclamation service has had many critics, but it has not today by any means as many as it had a few years ago. It is making good, and thousands of acres of desert are fruitful acres today because of the movement made possible by Theodore Roosevelt. Its success has been because of the work of such men as Homer Hamlin, who died in Washington a few days ago in the service of the farmers.

Mr. Hamlin directed the laying of the foundations of the great Laguna diversion dam which has made possible reclaiming several thousand acres of the Colorado Desert on the California side and of an even greater number of acres on the Arizona side of the Colorado River near Yuma. After years of service on that great dam he took up work with the city of Los Angeles as its engineer. This work he held many years, and more recently has returned to the greater work of reclaiming the desert. At the time of his death he was acting with the Salt River Valley Water Users Association in the endeavor to secure beneficial legislation at Washington Mr. Hamlin's friends, those who knew him intimately, realized his high character and true worth. A group of Californians who were in Washington at the time of his death paid tribute to Mr. Hamlin in a wire to Mrs. Hamlin:

"A group of sincere California friends who have known your husband for from 20 to 30 years and who were his intimate associates in engineering work and in the Engineers and Architects Association of Southern California desire to extend to you in your bereavement their deepest sympathy in the loss of one whose character and accomplishments endear his memory to the hearts of all."

This was signed by Congressman H. Z. Osborne; Gen. Amos A. Fries, chief gas defense, war department; Arthur P. Davis, chief reclamation service; Edgar L. Swaine, superintendent army engineers' transport service, war department; Frank Van Vleck, United States war department.

FIRE FIGHTING HINTS

All matches are dangerous from a fire standpoint.

Smoking or striking matches in barns or stables should never be allowed.

Pouring gasoline or kerosene on a smoldering fire endangers life, limb and property.

Open Flame lights should not be used in a garage or building containing a gasoline engine or gasoline in storage.

Never test for gas leaks with a burning match.

Every open fire should be watched until it is out.

Fire attracts children; children cause many fires.

All oily rags should be kept in a metal container with an air tight metal cover.

The floor beneath stoves should have metal covering.

Fire hazard should be considered in locating new buildings.

Woodwork should not come in contact with any chimneys.

Responsibility for fires rests on individuals.

DOES COW TESTING PAY?

The Los Angeles County farm bureau, like some of the other farm bureaus of the state, is doing some real and progressive work. One of the most progressive of its latest activities is that of the county cow testing association—rather associations, for there are three cow testers employed to test the 3,500 cows who are members of the association.

To make emphatic the advantages in this cow testing work. Adviser Scribner took the dairymen who attended the recent dairymen's institute at Los Angeles County Farm into the corrals and visualized a story of production. We do not recall the exact figures of the production of two cows which were taken for examples, but so vivid was one feature of the demonstration that we pass it on to our readers.

One cow was brought into the circle of farm bureau folk and her production, which was really wonderful, was marked down to her credit. Another cow, destined soon to go to the block because of her underproduction, was brought in. Up to the present she has been maintained as a dairy cow, and if the entire dairy had been made up of cows of the same capacity it would have required 165 cows to produce the same profit as was given by the other one cow. And they didn't look it, that is, the eye of the most experienced of dairyman would not be sufficiently discriminating to determine the real worth of these cows. The scales and the Babcock test were necessary—which is possible in most dairies only through the cow testing association.

VIRGINIA PURE SEED LAW

The Virginia state pure seed law provides for "an analysis tag" giving kind of seed, percentage pure seed, percentage weed seeds, percentage and name of noxious weed seeds per ounce, percentage germination, with month and year of test.

The farmer buys his seed based on what the tag tells him. If he is dissatisfied all he has to do is to forward the "Analysis Tag" with a sample to the department of agriculture at Richmond, where the seeds will be tested and a report made. The Virginia law is especially hard on offenders.

Best Fruit for Planting

THE article appearing in the last California Cultivator written by L. B. Scott touching upon the work already accomplished by the Nurserymen's Bud Selection Association of California, gives to Cultivator readers an idea as to one of the most important events in the history of California fruit growing. The association is now squaring away for work which will wonderfully increase the profit in this industry, providing recommendations of the Sacramento meeting are followed. At this meeting there were in attendance over 50 fruit growers, shippers and nurserymen. A very extensive discussion of the varieties named was had, and it was the unanimous opinion that the list as finally made out was very satisfactory and that it contained those varieties which should be propagated and eliminated those which were not worthy of further commercial plantings. The outline of the meeting as given by Mr. Holman contained very complete information as to the desired varieties, but we have just received from R. H. Taylor, assistant to the chief division of plant industry, a copy of the ballot which was submitted to fruit growers, nurserymen and canners for the purpose of registering the opinion of the various experts who were invited to attend the meeting at Sacramento. The acceptances and indorsement by the conference resulted as follows:

Cherries

Adopted: Bing, Black Tartarian, Burbank, Chapman, Lambert, Black Oregon, Royal Ann.

Home Orchard only: Centennial, Giant.

For Canning: Montmorency (sour), Gov. Wood.

Eliminated: Abundance, Early Purple Guigne, Nonpareil, Knight's Early Black, Rockport Bigareau, Llewelling, Black Republican.

Peaches

Adopted for Shipping: Alexander, Decker, Early Crawford, St. John, Elberta, Hale's Early, Early Elberta, J. H. Hale, Mayflower, Triumph, Wheatland, Salway (limited planting recommended).

Home Orchard: Morris White, Strawberry Free.

Eliminated: Admiral Dewey, Belveu's Late, Briggs Red May, Crumbles October, Early Imperial, Foster, June Elberta, Late Crawford, Madera Early, Old Wickson Free, Harrol's October Opulent, Oklahoma Queen, Oklahoma Beauty, Picquet's Late, Red Bird Cling, Sneed, Susquehanna.

Drying Freestone Peaches

Adopted: Lovell (recommended 25 per cent), Muir (recommended 75 per cent).

The recommendation of the canners is that for canning freestones there be planted 74 per cent Lovell, 10 per cent Muir, 10 per cent Elberta, 10 per cent Salway, and that for canning freestones all other varieties be eliminated. The Hauss was recommended as a good variety for Sutter County.

Eliminated: Early Crawford, Elberta, Foster, J. H. Hale, Late Crawford, Susquehanna, Salway.

Canning Clingstone Peaches

Adopted: Albright, Libbee, Levi, McDevitt, Pelora, Peak's, Phillips, Sims, Tuscan.

The canners recommended the planting of clingstone peaches for canning: 40 per cent, Levy five per cent (for Tuscan 25 per cent, Pelora and Peak's 10 per cent, Albright five per cent, Sims and Libbee 10 per cent, Phillips 40 per cent, Levy five per cent (for Placer County), McDevitt five per cent. Hauss recommended for Sutter County.

Eliminated: Chinese, George's Late, Lemon, McDevitt, Runyon's Orange, Seller's Orange, Selma, White Heath.

Nectarines

Adopted: Gower (shipping), Stanwick (drying).

Home Orchard: Humbolt, New White.

Eliminated: Advance, Boston, Hardwick, Victoria, Napier.

Shipping Plums

Adopted: Anita, Beauty, Cal Blue (Vacaville), Burbank, Climax, Diamond, Gaviota, Giant, Grand Duke, Duarte, Hungarian, Kelsey, President, Santa Rosa, Tragedy, Wickson.

Home Orchard: Apex Plumcot, Damson, Satsuma.

New: Becky Smith (for trial).

Eliminated: Clyman, Coe's Golden Drop, Abundance, Botan, Fellenburg, Formosa, German, Paragon, Red June, Standard, Sugar.

Canning Plums

Adopted: The canners recommended the planting of 25 per cent Washington, 40 per cent Yellow Egg, 25 per cent Jefferson, ten per cent Bavey's Green Gage.

Eliminated: Imperial Gage.

Apricots

Adopted: Blenheim, Royal, Tilton.

Home Orchard: Hemskirk, Routier's Peach.

Canning and Drying: Moorpark (drying).

The canners recommended that for the coast 100 per cent Blenheim be planted, interior San Joaquin Valley conditions 100 per cent Tilton, interior Sacramento Valley conditions 50 per cent Blenheim, 50 per cent Tilton.

Eliminated: Large Early Montgammet, Newcastle Early, Pringle.

Drying Prunes

Adopted: French, 70 per cent; Imperial, ten per cent; Robe de Sergeant, ten per cent; Sugar, ten per cent.

The Prune & Apricot Growers Association recommended that 85 per cent of prune planting should constitute French, on account of their regular and heavy productiveness over a wide scope, but on those locations and in those localities where the local conditions are better adapted to Imperial, Robe de Sergeant and Sugar the following was recommended: Imperial, ten per cent; French, 70 per cent; Robe de Sergeant, ten per cent, and Sugar, ten per cent.

Eliminated: Conquest, Silver, Standard.

Pears

Adopted: Bartlett, Beurre Bosc, Beurre Clairgeau, Beurre d'Anjou, Beurre Hardy, Comet, Easter Beurre, Forelle, Glout Morceau, Wilder, Winter Nelis, Comice.

Home Orchard: Winter Seckel.

Eliminated: Flemish Beauty, Howell, Madeline, P. Barry, Winter Bartlett.

Quinces

Adopted: Pineapple, Van Deman.

Home Orchard: Smyrna Quince.

Eliminated: Apple (Orange), Champion, Rae's Mammoth.

Persimmons

Adopted: Hachiya, Hyakume, Tane-Nashi.

Eliminated: Dai Dai Maru, Mammoth Goshio, Yemon.

Apples

We are not mentioning apple varieties for the reason that these will be passed upon at a meeting to be held later with the apple growers associations of California.

PRICKLY LETTUCE OIL

In a recent Egyptian bulletin analyses are given of several samples of Egyptian lettuce oil obtained by expression from the seeds of Lactuca scariola oleifera, a variety of prickly lettuce, a weed common in California. It is said that considerable quantities of this oil are consumed annually in Egypt, and the possibility is suggested of its being sent to other countries, either as an adulterant of other oils or as a constituent of vegetable margarins.

The oil when filtered and dried is of a clear golden color, a characteristic and rather pleasant taste, and a slight odor.

Work is progressing in the organization of the State Grape Growers Exchange.

(Copyrighted 1920, by Leader Iron Works)

One of the Leader home Water Systems. There is a Leader outfit to meet the requirements of any home and farm.

Let the Leader *waterfy* your home and farm

You need a running water system for *your* home and farm; there's no question about the *time* it will save you—time is money now—and you must have a system that is always reliable.

Leader

Home Water Systems—Leaders in fame as well as in name

has been satisfying customers since 1903. It *will* last a life time. We chose to sell The Leader, because it is absolutely the best Water System made. It is the only home system where tanks and pumps are made in one factory. To insure reliability the complete system is equipped with world standard power—Wagner Motors or Stover Good Gasoline Engines.

Now is the time to *Waterfy* your home with a Leader. For your own sake—for your family's sake—see the Leader dealer in your neighborhood today. If you don't know him, write us. We guarantee you *Satisfaction*, *Service* and *Saving*.

Hedges-Atkins Supply Co.,
Denver, Colo.

Established 1903 — Leader — Tanks, Pumps and Power Equipment

PEAR TREES

Should Be Ordered Early

for next winter's planting to make sure of receiving them and not being disappointed.

PLANTING OUR TREES OF QUALITY

will insure satisfaction and we can supply your needs in all other varieties as well.

Crop Reports

Continuing Reports from the Orchards Begun in Cultivator of April 24

G. R. Gorton, Horticultural Commissioner, San Diego County

The crop conditions in this county, so far as we can tell at this date, are as follows:

Almonds: 90 per cent.
Apples: 90 per cent.
Apricots: 100 per cent.
Cherries, 15 per cent.
Peaches, 100 per cent.
Pears, 100 per cent.
Prunes, 90 per cent.

Moisture conditions have been exceptionally favorable this year. We have not suffered from drouth by reason of the fact that we received considerable benefit from what we term "Mexican storms" which come up from the south but do not reach a point very much farther north than San Diego.

We have had no damaging frost on citrus and very slight damage on cherries in the mountains, which I have estimated at possibly 15 per cent. We are pretty sure of the pear and apple crop in the mountain sections, and I do not think that any great revision of figures will be necessary.

Fred P. Roullard, Horticultural Commissioner, Fresno County

Almonds: Good, but small area planted.
Apricots: Good condition.
Cherries: No cherries.
Peaches: Look very well; a number of doubles and a little curl leaf, but looks like a normal crop.

J. W. Mills, Farm Adviser Solano County

Almonds: 15 to 20 per cent.
Apples: No apples grown here.
Apricots: 50 per cent.
Cherries: 100 per cent.
Peaches: 75 per cent.
Pears: 40 per cent.
Prunes: 50 per cent.

E. B. Beeton, Beaumont, Riverside County

Some three weeks ago the report went out from Beaumont that a normal set of fruit was then in progress, basing the opinion on the fullness of bloom then in development. Later conditions prove that those who made the 100 per cent estimate shot wide of the mark. At the present writing, May 10, without taking into consideration the June drop, the indications point to the following conclusion: Apples, 50 per cent; cherries, 70 per cent; pears, 80 per cent.

Winters Dried Fruit Company, Yolo County

The crop prospects in this section for the coming season are as follows:

Apricots: About 50 per cent of last season, or about 5,000 green tons. A larger per cent will be dried on account of shot-hole fungus.

Almonds: Hatch varieties will be light, especially the IXL's and Neplus, which were damaged by early frost. Nonpareils about 65 per cent of crop, balance of varieties will probably average about 75 per cent. Some new acreage coming into bearing.

Peaches: All varieties about 60 per cent of last season, caused by trees affected with borers, necessitating heavy cutting when pruning, reducing the bearing wood.

Prunes: Looking fair, about 75 per cent of crop.

Pears: Good prospect.

Our rainfall for the season was only ten inches, or about one-half of normal. Irrigating water scarce, future does not look promising. Indications all fruit will be under sized.

Your Rail-less Railroad

YOUR live stock and the produce from your fields, carried in freight trains to the cities, thunder past countless danger-signs with the warning, "Look Out for the Cars!" Each one of these marks the crossing-place of a country road—a road without rails, leading to railroad and town. Each one marks a farmer's right-of-way.

Since your farm is a 1920 enterprise, probably it is fitted with most of the following modern equipment—the telephone, good lighting and heating, a silo, a manure spreader, a cream separator, an automobile, an engine, a tractor.

But have your hauling problems found their proper solution? Are the time-losses and difficulties of a decade ago still impeding your endless carrying of farm loads?

Government statistics show that in 1918 alone, 350,000,000 tons of farm produce were transported to local shipping centers in motor trucks. The same national figures prove also that American farmers are the greatest users of motor trucks—among all industries. No progressive farmer can afford to overlook impressive *facts* like these.

Your name and address mailed to our office at Chicago will bring you descriptive folders that will prove interesting and instructive. Put an ***International Motor Truck*** at work on your farm and on the roads which are your right-of-way. Handle all your miscellaneous farm hauling with railway efficiency. The nine ***International Motor Truck*** sizes range from ¾ ton to 3½ ton. Keep in mind that these trucks have been made for years by the makers of good and trusted farm machines.

HORTICULTURAL AND AGRICULTURAL LEGISLATION

(Continued from Page 845.)

ing or other organizations to name the delegates. It required some weeks and even months to get action from these various associations but the organizing committee which was named at the convention has succeeded in securing from practically every large interest in the state a representative.

The roll call now shows the following regularly elected delegates representing associations:

J. L. Nagle, Cal. Fruit Exc.; H. C. Malone, Cal. Pear Growers Assn.; F. M. Wit, Central Cal. Berry Growers Assn.; Geo. W. Ashley, San Joaquin Table Grape Growers Assn.; E. C. Merritt, Sebastopol Apple Growers Assn.; J. M. Henderson, Jr., Associated Dairymen of Cal.; F. B. McKevitt, Cal. Fruit Distributors; J. H. Barber, Poultry Producers of Cen. Cal. and Poultry Producers of So. Cal.; L. A. Nares, Cal. Cattlemen's Assn.; Geo. W. Pierce, Cal. Almond Growers Exchange; G. Harold Powell, Cal. Fruit Growers Exch.; C. C. Perkins, Cal. Lima Bean Growers Assn.; A. E. Sunderland, Cal. Associated Raisin Co.; G. H. Coykendall, Cal. Prune and Apricot Growers, Inc.; C. C. Teague, Cal. Walnut Growers Assn.; F. H. Wilson, Cal. Peach Growers.

The basis for the organization reads as follows:

"The object of the legislative committee is to provide a permanent organization which will initiate and encourage legislation to foster and protect the horticultural and agricultural interests of the state; to consider legislation affecting the state, county and local governments that are charged with the protection and development of the horticultural and agricultural interests; and to study their administration and their interrelationships with a view to increasing their value to the state.

"The permanent organization shall be composed only of representatives of producers' organizations, or shippers who represent producers or producers' organizations. It shall not include in its membership public officials, county or state, either as such, or as representatives of the producers' organizations, nor shall it include purely speculative organizations. In the deliberations of the committee all representatives shall have one vote. The permanent committee may appoint an executive committee which shall act for the permanent committee between the meetings of the latter.

"The secretary is to be a salaried officer who shall act as the executive officer of the committee, under the direction of the executive committee The delegates present at the preliminary meeting shall form a temporary organization, appoint a chairman and a secretary for the purpose of presenting the following plan to the horticultural and agricultural producing organizations of the state with a view to the formation of a permanent legislative committee, the chairman and secretary to call a meeting of the duly accredited representatives when appointed by their organizations for purposes of permanent organization

"The expenses of the organization shall be paid by an assessment levied from time to time by the committee on the basis of the f. o. b. value of the product actually sold of the members thereof for the year preceding the assessment, or a minimum fee shall be set by the executive committee for each organization which cannot arrive at the f. o. b. value of the product sold, such fee to be approved by the organization concerned Each of the members agrees to pay its proportional assessment on that basis."

President, C. C. Teague; executive secretary, R. N. Wilson.

The executive committee is: C. C Teague, G. Harold Powell, Geo W Pierce, F. B. McKevitt, L. A. Nares. F. H. Wilson, H. G. Coykendall.

CAPRIFIGS

"Caprifigs and Caprification," by I J. Condit, is issued by the agricultural experiment station, college of agriculture, Berkeley, as Bulletin No. 319

"For many centuries there has been grown in a small valley of Asia Minor a type of fig known as the Smyrna so called from the seaport where the figs are packed and shipped The superior quality of these dried Smyrna figs is recognized in all markets to

which they have been shipped and other fig growing countries have long striven to produce the same quality in their own fig product. It was known that the native growers of Smyrna made a practice in the spring of the year of suspending wild figs, or caprifigs, in the Smyrna trees. From these caprifigs there issued hundreds of small insects or wasps known scientifically as Blastophaga grossorum, which entered the eye of the Smyrna fig, causing the fruit to set. In case this operation was neglected, or if caprifigs were unobtainable, the small Smyrna figs soon turned yellow and dropped off, causing a crop failure. The process of distributing caprifigs among the branches of the Smyrna fig tree, thus insuring the setting of the fruit of the latter, is known as caprification. Although caprification was known by the native growers to be absolutely necessary to crop production, they did not understand the principles underlying the process or the real causes either for the setting or the dropping of the Smyrna fruit. European Investigators have studied the process and published many articles about it, but it is only since the introduction of the true Smyrna fig into California and the establishment of the fig wasp that the necessity for a thorough knowledge of its practical aspects has been appreciated. On account of the very rapid growth of the fig industry in California and the recent large plantings of Smyrna figs, there is a keen demand for practical information about varieties of caprifigs, cost of caprification, and methods of distributing the figs in the orchard."

"WHITE ANTS" DAMAGE GRAPEVINES

Damage to grapevines in California by termites, erroneously called "white ants," has been reported by R. L. Nougaret, in charge of the office of viticulture of the California department of agriculture. Mr. Nougaret recently visited the Livingston district in Merced County and uncovered considerable damage to grapevines in that section. It appears that it has been the custom to use canes or bamboo as markers for young vines, and that these same canes contain, in the joints, colonies of the termites which eventually migrate to the young grapevines, where they eat out the pith from the root upwards, the injury being undiscovered until pruning time.

Mr. Nougaret discourages the use of bamboo cuttings as markers and advises that they be collected, piled and burned.

In localities where termites are known to exist all stakes, whether canes, bamboo or otherwise, should be treated with hot tar or creosote before use in the vineyard.

CHLORIDE OF LIME FOR BORERS

Some weeks ago Dr. Snowden suggested that as a remedy for borers chloride of lime be applied as a wash about the base of the trees; also as a possible remedy for fungi on all trees. He suggested using care and making tests rather frequently so as to learn what effect the chloride of lime had on the bark of the trees. Later an inquiry came as to the strength of the solution, to which the doctor replied: "I would suggest: Try three different strengths of the solution, to wit: One-fourth pound to the gallon. One-half pound to the gallon. One pound to the gallon. It ought to be rubbed to a thick paste with a small quantity of water first to get all the lumps thoroughly reduced before mixing with a larger quantity of water."

FIGHT THE OAK WORM

The live oak and the valley oak, which are characteristic of the landscape of Central California, often are stripped of their leaves by a dark striped worm which is the young stage of a light brown moth. Besides stripping the trees of their leaves and making the owner think that they are dead, the worm crawls on lawns, walks, fences, and into houses, swimming pools, etc., becoming a general nuisance.

Two generations of the pest occur during the year. The worms are most noticeable during April and May and again in August and September; the moths during June and July and again in October and November.

The best method of control is to spray the worm infested trees with a mixture of three to five pounds of arsenate of lead paste dissolved in 50 gallons of water.

This should be done while the worms are small. The live oaks should be sprayed in April and again, if necessary, about the first of August, when the deciduous oaks are sprayed.

Farmers' Bulletin 1076, "California Oak Worm," describes and illustrates the worm and its work, tells about its habits and natural enemies, and explains the methods of control. The bulletin will be sent free on request to United States Department of Agriculture, Washington, D. C.

JACK FROST RAIDS PEACH CROP

It is said that the law of compensation works both ways—if the rich man gets his ice in the summer, the poor man gets his share in the winter. Averages of peach production appear to follow the same rule, according to the estimates just published by the bureau of crop estimates, United States department of agriculture.

Barring the possibilities of further disaster, the commercial peach orchards of Georgia and North and South Carolina will produce fairly heavy crops. California is scheduled for a bumper crop, and several other states will not be far below their 1919 average in carlot shipments of peaches, but these good prospects are more than offset by the frost damage inflicted upon the orchards in other states. Texas has been badly hurt, and so, also, have the Arkansas, Oklahoma, Missouri and Tennessee orchards. The New England crop is reported ruined, and Washington, Utah and Idaho report severe winter killing. To some extent the prospective crop is still further diminished by the decrease in acreage devoted to commercial peach orchards.

PECAN GROWERS

A meeting of the Texas State Pecan Growers Association will be held in Brownwood, Texas, this week, for the purpose of perfecting a cooperative marketing association through which Texas native pecans will be sold to the best advantage of the growers of the state. J. H. Burkett of Clyde, Texas, is chairman of the convention.

Watsonville, Santa Cruz County, has a standard bread ordinance providing minimum loaf weights of 16 and 24 ounces.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Alien Securing Citizenship

Please give outline of steps necessary for an alien to become a citizen, where should he first apply?—Subscriber, Nipomo.

Jurisdiction to naturalize aliens as citizens of the United States is conferred upon the district courts of the United States and the courts of record in territories and states. The alien appears before the clerk of the courts in the district in which he has resided for at least two years prior. Thus, one residing in Los Angeles County would apply either before the superior court or the United States district court. The alien requests form of declaration of intention and fills it out. He must have reached the age of 18 years and state that it is his bona fide intention to become a citizen of the United States and to renounce allegiance to the particular prince or sovereignty of which he may be a subject. Such declaration must also set forth name, age, occupation, personal description, place of birth, last foreign residence and allegiance, date of arrival, name of vessel if any, and present place of residence in the United States. Not less than two nor more than seven years after making this declaration he must make and file in duplicate a petition signed in his own writing, verified, in which he will state in effect the same things as in the original declaration and the facts concerning the making of his declaration, also the name of his wife, if any, the country of her nativity, place of residence at the time of filing petition, and if there are any children, the same facts concerning them. The petition shall also set forth that he is not affiliated with any organization opposed to organized government or in favor of polygamy, and that he is not a disbeliever in organized government; that it is his intention to become a citizen of the United States and renounce his former allegiance, to reside permanently in the United States. The petition must be verified by the affidavits of two credible witnesses, citizens of the United States, who have known the applicant as a resident of the United States for at least five years continuously theretofore, and of the district in which the application is made for at least one year; that the applicant is a person of good, moral character and qualified to become a citizen. There must also be filed a certificate from the department of commerce and labor stating the date, place and manner of the alien's arrival in the United States, and the declaration of intention of the petitioner which will be attached to the petition. Thereafter he must appear in open court and swear his allegiance to the constitution of the United States and renounce his fealty to any other sovereignty, and that he will support and defend the constitution and laws of the United States. It must then be made to appear to the satisfaction of the court that he has resided continuously within the United States for at least five years preceding and within the district where the court is held for at least one year, behaved himself as a man of good moral character and is attached to the principles of the constitution, and well disposed to good order. He must then produce the testimony of at least two witnesses, citizens of the United States, to the foregoing facts. If he has held any hereditary title he must expressly renounce it. After the filing of the petition the clerk of the court must post notice of the date of the final hearing, giving the names of the witnesses and the description of the alien seeking a naturalization. Action upon the petition by the court can in no case be taken until 90 days have elapsed after the filing of petition and posting of the notice, and no certificate of naturalization shall be issued within 30 days preceding the holding of any general election. The court may in its discretion at the time of naturalizing the alien on the petition of the alien, decree that the name of said alien may be changed, and certificate of naturalization shall be issued to him in accordance with the changed name. No one who disbelieves in organized government or is what is commonly termed an anarchist or polygamist can become a citizen, nor can anyone be admitted who cannot speak the English language. The United States has the right to appear in any of the courts, cross-examine the petitioner or his witnesses and in all ways produce evidence in opposition to the granting of any petition. Fees are provided: For the filing of declaration of intention and issuing a duplicate thereof, one dollar; for the filing of the petition for admission and final hearing, two dollars; for the final order and issuance of the certificate of citizenship, two dollars, in addition thereto such amount must be deposited as will be sufficient to cover the expenses of paying the legal fees of the witnesses. On the issuance of the final order, a certified copy thereof shall be furnished to the alien which he shall be entitled to keep.

Community Property

A married couple have community property held in the name of the wife. In case the wife dies before the husband, leaving no will, what disposition is made of the property?—Subscriber, Claremont.

Upon the death of the wife the entire community property without administration belongs to the surviving husband under the law at the present time, (what is known as "The Community Property Law" being held up by referendum), but wherever any property is conveyed to a married woman by an instrument in writing, the presumption is that the title is thereby vested in her as her separate property, in which event, the husband would receive upon the wife's death, in case he was unable to prove that the property was in fact community property, only one-third or one-half of the amount of the property as the case might be with respect to children. He would of course be entitled to appear in court and petition that the whole property be set aside to him upon the showing that it is community property, but he would have to overcome the presumption of the law.

Estate of Unmarried Person

If an unmarried person dies without leaving a will, what is the law concerning the disposition of his property, both real and personal? Must there be an administration and who are the legal heirs?—Subscriber, Claremont.

The only method of which the law knows for distributing property upon the death of any party is through the intervention of the probate courts. This would require an administrator In the event stated, the property goes to the father and mother in equal shares, or if either is dead then to the other. In case they are both dead, then in equal shares to the brothers and sisters. In case there are no brothers and sisters, it goes to the next of kin in equal degree; those claiming through the nearest ancestor being preferred to those claiming through an ancestor more remote.

SULPHATE FOR ALFALFA

Oregon state bulletin 163, entitled "Sulphur as a Fertilizer" for alfalfa in Southern Oregon should be of much interest to Californians, for in it the results of various preliminary experiments are reported, which indicated that sulphur in various forms had a favorable influence on certain crops, especially alfalfa. Further experiments conducted from 1915 to 1918 inclusive, on various types of soil showed that the alfalfa and clover crop can be increased from 50 to 1,000 per cent on many soils by the use of various fertilizers containing sulphur These soils included very diverse types, ranging from the coarse granite soils to the heaviest adobes, were well supplied with potassium, calcium magnesium and iron, but contained only limited amounts of sulphur.

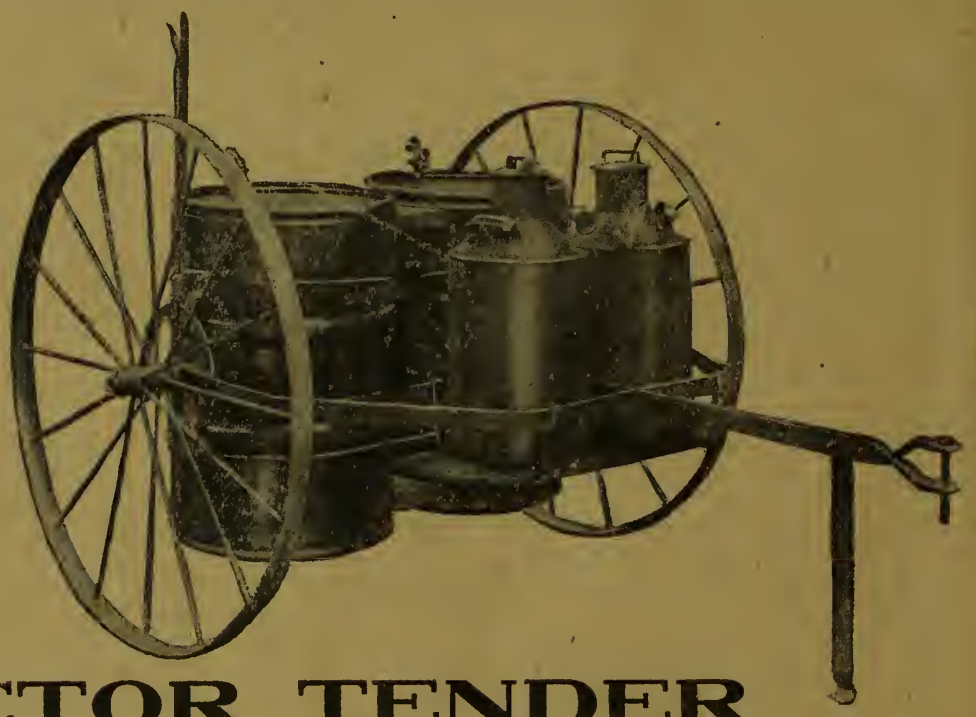
The following fertilizers, containing sulphur, produced similar beneficial results: Flowers of sulphur, superphosphate, gypsum, iron sulphate, sulphate of ammonia, sulphate of potash sulphate of magnesium, and sodium sulphate. On these soils applications of sodium nitrate, monocalcic phosphate, potassium muriate, and lime had little or no effect on alfalfa. "It is apparent from this that the beneficial results obtained from the various sulphur fertilizers can not be attributed to any extent to any effect such fertilizers may have in liberating phosphorus, potassium, or lime in the soil, or on nitrification."

Better results were obtained the first season, where the sulphur was applied to the soil in the fall or early winter, than where applied in the spring. The first season the gypsum and other sulphate fertilizers usually gave better results than flowers of sulphur if applied in quantities supplying equal amounts of sulphur. The second season there was little or no difference in the yield. The various sulphur fertilizers had a very stimulative effect on the root system, le-

Stop Wasting Expensive Fuel

Statistics show that 35 per cent of fuel loss is directly due to spillage from improper facilities for handling.

Every tractor owner spills enough fuel in one season to more than pay for a—



TRACTOR TENDER

With one hand the barrels may be quickly tilted to any position and drained without wasting a drop. Saves time as well as fuel—both mean money. The tender is light and can be hauled behind your auto as well as your tractor. Room for a couple of milk cans of water.

We also have 2 compartment steel fuel tanks for wagons or trucks in 260 to 360 gallon capacities.

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes. LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill into the soil 110 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%. Send for Circulars No. 6 and 7.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 degree BE., etc., Fungicides and Insecticides.

Carried in stock and mixed to order.

OTTAWA MFG. CO., 2741 Wood St., Ottawa, Kans.

Linden, San Joaquin County, has a 500 acre walnut orchard.

creasing its size and the number of nodules.

Analyses made of the alfalfa plant grown under local conditions from fertilized and unfertilized plats showed that the fertilized plants contained more sulphur, more protein and more nitrogen than the unfertilized plants. Alfalfa hay grown under local conditions did not contain as much sulphur as that in the Middle Western states.

The amount in alfalfa hay from fertilized plats varied from 3.34 to 4.54 pounds of sulphur to the ton, and in the hay from the unfertilized plats from 2.36 to 2.54 pounds. In the hay from the fertilized plats, from 71 to 79 per cent of the sulphur was in organic form, the remainder in sulphate form, while in the hay from the unfertilized plats all the sulphur was in organic form. Up to the present time gypsum has given as good results on most of the soils as superphosphate. Since the prosphorus content of many of these soils is rather low, it is considered probable that the superphosphate will eventually give better results than gypsum.

"On most all of the soils in Southern Oregon an annual application on alfalfa of 200 pounds of gypsum, or 250 pounds of superphosphate, or 40 to 50 pounds of sulphur and 200 pounds of rock phosphate, will prove highly profitable. The latter combination will supply both sulphur and phosphorus most economically. Sulphur should not be used by itself on soils deficient in lime, as it will cause soil acidity. On such soils it should be used only in conjunction with liberal quantities of lime or rock prosphate."

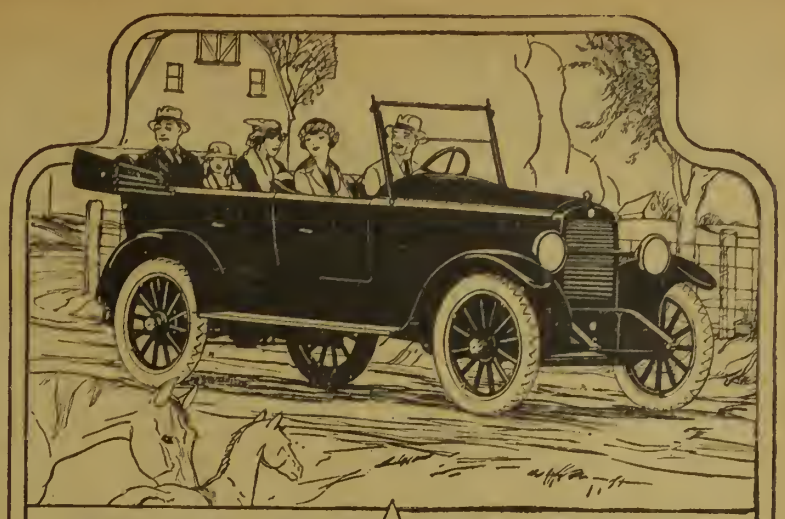
ONION DISEASE

In a recent United States department of agriculture bulletin popular descriptions are given of the more important diseases occurring in the field, in storage and in transit. Among the diseases occurring in the field the author describes smut, mildew (blight), leaf mold, fusarium rot, pink root and root knot, and among the diseases primarily important in storage and transit are neck rot, soft rot, black mold and smudge (anthracnose blackspot). Suggestions are given for the control of some of these diseases, the onion smut being readily controlled by applying formaldehyde solution by means of a drip attachment to the seeder. Mildew (blight) is said to be controlled by applying formaldehyde solution by means of a drip attachment to the seeder. Mildew (blight) is said to be controlled by avoiding excessive soil moisture, by the practice of crop rotation, and by thorough cultivation. The storage diseases can be controlled by giving attention to cultural methods and to sanitary measures.

EAT RABBITS

Besides killing approximately 35,000 jack rabbits which were injurious to crops, the rabbit "drives" which have taken place in Eastern Washington during recent months have helped to lessen living costs by putting on the market a considerable amount of rabbit meat. The biological survey of the United States department of agriculture, under whose supervision the drives were conducted, found on investigation that there was a good demand for wild rabbit meat. Trial shipments made to seven markets indicated that white tailed rabbits would bring the shipper about $2.50 a dozen and black tailed rabbits about 50 cents less. Persons desirous of marketing rabbits were advised that those which had been shot were preferred to those which had been harried and killed by clubbing, and that the carcasses should be drawn as soon as possible after they had been cooled. The sales made the past season were chiefly in Spokane, Portland, Seattle and Tacoma. Considerable interest is being shown in the proposal to further extend sale of jack rabbit meat by trapping the animals in inclosures, properly baited, and supplying certain markets with shipments of a definite size at stated intervals.

Plans for series of summer chatauquas of the Washington Federation of Farm Organizations include a circuit in the Inland Empire, with meetings at Spokane, Yakima, and probably Walla Walla and Wenatchee. It is anticipated that 5,000 farmers will attend the gatherings in each district.



BRISCOE

"Before you decide Take a Briscoe ride"

EVERYTHING you want in a car, you'll find on the 1920 Briscoe.

It's a car you and the whole family will be proud to ride in. And it's a car you'll be comfortable in, for there's plenty of leg and body space, with long flat springs that ease every road inequality.

Light in weight, the Briscoe is easy on tires and mechanical parts. And the famous unit power-plant eats up the miles but not the gasoline.

There's a Briscoe showroom near you. See the car, and judge it for yourself.

Estimate of Acreage in Beans and Potatoes

By E. E. Kaufffman, Feld Agent, Bureau of Crop Estimates

ORDINARILY the bureau of crop estimates does not make a detailed report concerning the acreage planted to beans and potatoes until July, but owing to shortage of potatoes, with the consequent high price, and a large quantity of beans still in the hands of farmers and dealers from the crops of 1918 and 1919, considerable interest has been manifested as to the probable acreage to be planted to beans and potatoes in 1920. In order to supply the best possible information to the public the bureau has made a special inquiry in the leading bean and potato states concerning the intentions of farmers to plant these crops, with the results as indicated in the table below. The states named are those which lead in the production of the commercial, or late storage, potato crop.

As of May 1, it now appears that in California the acreage planted to Lima beans, including Baby Limas, will be about 90 per cent of last year; other varieties of beans, 45 per cent of last year; thus making the intended planting of all beans this year about 60 per cent of last year's acreage, or in round numbers, 240,000 acres. Damage to the barley crop in some localities the past two weeks may increase the acreage planted to "beans other than limas" more than the figure now indicated.

Acreage Per Cent of Last Year

	Potatoes.	Beans.
California	110	60
Colorado	94	65
Idaho	95	100
Maine	*	....
Michigan	90	75
Minnesota	89	....
New Mexico	....	80
New York	97	90
Wisconsin	95	70
Average	95	71

*Uncertain; planted area dependent on receipt of fertilizer.

State Horticultural Commissioner Dean of Washington, has just returned from an inspection tour of apple orchards and says that the 1920 crop should at least equal that of 1919. He says there is practically no evidence of frost damage.

CLEAN UP THE STABLE FLY

Have you ever tried to sleep on a hot summer night when just one mosquito had crept through the window screen? Imagine your state of mind if that single mosquito were multiplied by 100 and you had your hands tied!

That sensation, according to the bureau of entomology, United States department of agriculture, is something comparable with what a horse, mule, or cow endures when the stable fly is present in great numbers.

The stable fly greatly resembles the ordinary house fly but for the lance with which he is armed. It is known that he carries disease from infected animals to healthy ones, and there is some ground for belief that the insect aids the spread of spinal meningitis among human beings.

The eggs of the fly are laid in loose, warm straw heaps and piles of stable refuse. A plague of flies always starts from these sources, and the control of the pest is best managed by scattering the straw early in the spring before the beginning of warm weather and plowing it under, or by burning it when the former method cannot be applied.

Stable refuse should be scattered at regular intervals of one week or less throughout the season, starting with early spring. In this way the first generation of the pest is destroyed and a plague averted. A recent publication of the department, Farmers' Bulletin 1097, gives in detail the life history of the stable fly, methods for its control, and some facts concerning the amount of damage done by the insect.

NEMATODE CONTROL

Many experiments are being carried on looking to control of the root and knot nematode, and in a recent issue of a science magazine a report is given of experiments made to determine the possibility of using hot water as a means of disinfecting small quantities of soil infested with the root knot nematode (Heterodera radicicola) and the damping off organisms Rhizoctonia sp. and Pythium debaryanum. The work was carried on with soil in four and eight inch pots and in shallow benches, and the investigations showed that the immersion of four inch pots of infested soil in boiling water for five minutes killed all the organisms concerned. The application of three liters of boiling water to eight inch pots of similarly infested soil gave identical results. The pouring of boiling water over infested soil at the rate of seven gallons per cubic foot of infested soil practically eliminated the nematode and fungi from shallow benches.

It was found that hydrocyanic acid gas as liberated in loam soil by applications of sodium cyanide and commercial ammonium sulphate failed to eradicate the root knot nematode from the soil, even when applied at the rate of 3,600 and 5,400 pounds, respectively, per acre. The chemicals were found to be about equally effective in powdered or liquid form. On account of the cost and because of the imperfect control, hydrocyanic acid gas is not considered to be a practicable means for controlling the root knot on large areas of loam soil. On a small scale, however, it is thought that it might be used to advantage.

LIMA BEANS

Manager Churchill of the Lima Bean Association reports:

Ventura County has planted this year 67,000 acres of Lima and Baby Lima beans, 20 per cent less than it did last year, the 20 per cent being planted in sugar beets instead on account of the uncertainty of prices of beans. The association has been moving Lima beans steadily at $10.43 f. o. b. cars, but is handicapped in making shipments on account of shortage of cars.

Santa Barbara County has planted 12,600 acres of Lima and Baby Lima beans; Orange County, 26,000 acres; San Diego County, 11,500 acres; Los Angeles County, 12,000 acres; San Fernando Valley has planted this year 20,000 acres.

In March the Lima Bean Association of Oxnard shipped over 300 cars of Lima beans at $10.43 net f. o. b cars.

A Purebred Holstein Calf Club has been organized by the boys of Modesto. The Holstein Breeders are backing the club.

BLASTING STUMPS

The engineers corps of the United States army has been conducting experiments in stump blasting and reports that experiments on the efficiency of Grade-III TNT as a stumping powder led to the conclusions that oak stumps can be blasted with this material, but that 9 pounds of TNT as used for a 3 foot stump is too large a charge and that about 5 pounds for a 3 foot stump and 2 pounds for a 1½ foot stump are about correct. It is further concluded that exposure of the explosive for a short time, i. e., an hour, to the moisture in a wet bore hole does not materially reduce its efficiency.

A solid oak stump about 3 feet in diameter and standing 18 inches out of the ground on wet clay soil was successfully blasted with a charge of 7 pounds of Grade-III TNT placed in 2 inch bore holes 4 feet below the surface, 1¾ pounds to the hole. Two oak logs 6 feet long and 39 and 42 inches in average diameter were successfully split into two pieces with 4 ounces and 5 ounces of Grade-III TNT, respectively, placed in a 2 inch bore hole, midway between the ends.

It is concluded "that Grade-III TNT can be used for such purposes as shooting stumps, splitting logs and breaking bowlders. It seems possible that the number of bore holes under a stump of the type of Shot No. 1 might be reduced to three or, in some cases, even less. No. 8 electric detonators seem to insure complete detonation. It seems probable that a smaller auger than 2 inch might be used to bore the holes for splitting logs, thus saving time and labor. In adobe shots on large flat bowlders, better results might be secured by using the same weight of explosive but placing it in two or more charges symmetrically distributed."

ALKALI WATER FOR IRRIGATION

A recent Utah bulletin discusses the work of others bearing on the subject and experiments are reported to determine the concentration of various salts necessary to make water unsuitable for irrigation in sand and loam soils.

It was found that the dry matter produced, the height of plants, the number and weight of leaves, the number and length of culms, the number of heads and spikelets, the turgidity of the plants, and the general appearance of the crops were all useful indicators of the effect of alkali water. Results in different soils showed that wheat should not be irrigated with water containing as much as 1,000 parts per million of sodium carbonate, and that even 500 parts per million will, in a short time, reduce the growth of the crop.

More than 1,000 parts per million of sodium sulphate proved to be harmful after two or three years. A mixture of the three salts—sodium chloride, sodium carbonate and sodium sulphate—was not so harmful as the most toxic but was more toxic than the least toxic individual salt. More than 4,000 parts per million of the mixed salts proved to be dangerous. Dilute concentrations of the salts often stimulated plant growth. On land irrigated with alkali water for only one year, or with but a single irrigation, much stronger concentrations than mentioned above could be endured; but for regular irrigation water, any concentration above about 500 parts per million of sodium carbonate, 1,000 parts per million of sodium chloride, 1,000 parts per million of sodium sulphate, and 4,000 parts per million of the mixed salts is considered dangerous.

SAVE WASTE

Spring is here and with it comes spring house cleaning. The housewives will, in cleaning out the house, throw away or burn great quantities of waste. The lessons learned during the war should not be forgotten; let it be borne in mind that the reclamation of waste is a problem which is not only fitted for war times but for the times of peace as well. The argument which may be advanced from time to time that the utilization of waste material in times other than war is not necessary is fallacious, because it is very essential that some means of offsetting the high cost of living be found.

Do not waste waste, but turn it back into the channels of commerce. You will be surprised at the tidy little sum of money that can be derived by turning over all character of old paper, rags, rubber, metals and other odds and ends to the junk dealers, who will in turn start this waste back into useful trades.

It has been estimated that the value of unreclaimed waste material throughout the United States in the form of paper, rubber, metals, etc., is about $500,000,000. Fully 90 per cent of this material can be reclaimed through the proper efforts.

BRITONS BUY MUCH AMERICAN HONEY

American honey is becoming increasingly popular in Great Britain. On account of the shortage of sugar the English people have taken readily to its use, and it now seems probable that the demand will continue even after sugar again becomes plentiful. The clear strained honey in the glass has the best sale, the preference being for California honeys, according to reports issued by bureau of markets, United States department of agriculture. In 1914 the total importations by the United Kingdom were approximately 2,600,000 pounds. By 1918 this had increased to 36,500,000 pounds, valued at $13,150,000. The United States contributed more to these totals in 1918 than any other country, its share being 16,000,000 pounds, valued at $5,500,000.

Build Up Your Soil With Whip-Poor-Will Cow Peas

WHAT THEY WILL DO:

They make the best summer covercrop.
Maintain a moist surface mulch.
Will prevent June drop.
Require less irrigation than other crops.
Need no irrigation where soil moisture has been conserved.
Build up poor soils with more nitrogen bacteria and humus than any other covercrop.
Afford the best kind of pasture for cattle and hogs.
As a hay have a food value of 43% more than Alfalfa.
Will improve your silage.
There is no better Bee Pasture.
Thirty pounds of seed is sufficient to plant one acre.
Our seed germinated 96%.

CALCO Grain Bins are cheaper and more durable—

CALCO METAL GRAIN BINS cost less than wooden granaries or concrete bins of the same capacity and last decidedly longer than wood. They are proof against rats, mice and vermin of all kinds.

Calco Bins are made of rust-resisting Armco-American Ingot Iron which is 99.84% pure. Unlike granaries of other materials, Calco Bins are highly resistant to all weather conditions, hence durability and long service are assured.

These bins are constructed sufficiently strong to resist the pressure of the grain when filled to capacity.

Being made of metal they are naturally fire-proof. The method of construction with padlocked man-hole, also makes them theft-proof.

You will find upon investigation that Calco Grain Bins have everything in their favor and nothing in their disfavor. If you see any disadvantages in the use of Calco Grain Bins, we should be glad to have you tell us about them.

These bins range in capacity from 600 bushels to 5450 bushels. They can be secured and erected in units of any number.

If there is no central station near you for loading grain in bulk, write us for information as to the construction of the inexpensive Baby Grand Elevator.

Order your bin at once and avoid the uncertainty that a last-minute order always means.

Unexcelled Accuracy

From far-off Sweden, to secure the most accurate existing standards, Holt inspection methods brought gauges that never err beyond 1-100,000th of an inch.

1000 sheets of the thinnest bible paper bulk more than an inch. Splitting one such sheet into 100 thinner sheets gives a fair idea of Holt exactness.

"Accuracy"—the complete story in booklet form—is sent free to you on request.

Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Drying Figs

How can I dry figs so they will be soft after drying?—Subscriber, Redlands.

Allow figs to remain on the trees until they drop naturally; with the exception of the large ones they are then dried sufficiently to keep and are much better eating than those that are dried in the sun. Place on trays and stack in sunny, airy place so that the dry air can penetrate the layers, covering top layer of course from direct sun rays. After two days sort out the hard, leathery feeling figs, leaving soft figs in stacks until dried. Then place all perfect dried fruit together in boxes or bins or piles in protection of a shed where they may remain for two weeks to sweat or equalize the moisture. (Figs may be piled in these sweat boxes from three to six feet deep.) They should be turned over with a shovel daily, if possible. After this the figs should be thoroughly washed in brine having strength of four ounces of salt to one gallon of water. Let figs remain in this brine from ten to 15 minutes. Place again on trays two to three inches deep and expose to direct sun for a half day to dry off. Trays are again stacked for two days, after which time figs are ready for packing away.

Grass on the Hillsides

Have noticed reference in your paper to Smilo grass. Will such grass be able to stand and give pasturage if seeded on hillside where irrigation is impossible? I have hill lot a mile back from the ocean; soil deep black loam; would like to seed to good grass that will resist drouth and still be fair pasture for milk cows. Will Smilo answer and what will seed cost per acre? What is method of planting? Would it be necessary to keep stock off first year?—Subscriber, Montara.

This was referred to H. L. Musser, who writes:

"From our experience in sowing this seed we have concluded that the best time to sow is in October, just prior to the rainy season. If it could be harrowed in, all the better. The seed roots very firmly and the cattle could be turned onto it immediately, as they cannot pull it up by the roots unless the ground is very soft or sandy, but when the plant is two or three months old it holds very firm. It will withstand drouth and matures an enormous quantity of seed and apparently every seed grows. It has become a pest in my garden and deligbts to grow on the solid walks and in the most unfavorable places. Last fall I scattered a pound of the seed on a vacant lot where fresh ground had beeu dumped; it seems every seed germinated. It is good pasture for milk cows. We have no test concerning its merits as a milk producer, but this test will be made this summer. We consider one pound to the acre sufficient to start its growth, and if allowed to produce any seed at all the following year it will make a very thick sod."

Budding Stone Fruits

Can peach be budded on apricot?—Subscriber, Van Nuys.

Yes, it is possible to bud various stone fruits on each other, but a seedling peach is considered the proper stock for peach buds. In case of heavier moist soils the Myrobalan has been used, but not so extensively as in former years.

Thinning Peaches

Would be grateful for information regarding thinning of peaches.—Subscriber, Ripon.

If the natural thinning or dropping has not already reduced the crop sufficiently, hand thinning is best. Where there is labor shortage some people have used bamboo poles and have thinned the tree promiscuously in this way; others will reduce the branches by pruning sufficiently. However, growers are doing less of the cutting than formerly. Where fine fruit is desired, hand thinning, choosing the fruits at intervals from four to six inches, accomplishes best results. It takes nerve, and the grower is liable to feel that he is removing altogether too much of his crop, but he never does.

Ants

How can I exterminate red ants?—Subscriber, Van Nuys.

The only way is to follow the trail to their hole and then pour in carbon bisulpbide, and the whole nest may be destroyed. Gasoline or boiling water is also used. See formula in our issue of August 23, 1919, repeated in issue of May 15, 1920, page 820.

Bats

Answering your McFarland subscriber about bats: Get a shotgun and kill your woodpeckers. They make the holes. Chase out your bats and stop holes and your troubles will be over—till more woodpeckers come. You may have to kill a few every year.—J. A. Romine, Hanford.

Tanning

Please give formula for tanning hides so they will be soft and pliable. —Subscriber, Dorris.

Here is formula given in former Cultivator which has worked very well. Like learning a trade, getting rich and some other things, the tanning of leather requires some experience and attention to details. Here are a few hints:

The skin should be salted on the flesh side as soon as the hide is cooled after removal, using ten to 12 pounds to a full sized calf skin. After salting roll the hide tightly. When ready for tanning place the hide in "soak," simply water to remove blood and salt. After being left in this 24 hours the tail and feet should be cut off, and the flesh adhering scraped off, after which the hide should be placed in lime water. To make the lime solution take a bucket of water to each quart of lime. When thoroughly soaked and mixed immerse the skin and allow to lie for three or four days. Thoroughly wash in cold water. Scour and pound in good soapsuds for half an hour, after which take white vitriol, alum and salt, one tablespoon each to skin, and dissolve in sufficient water to cover skin. Let remain in this 24 hours. Wring out and dry. To soften, oil with neatsfoot oil or currier's oil. It may again be washed out in soapsuds and hung up until nearly dry, when it should be worked and softened. If it should remain hard and refuse to soften, repeat the soaking in suds. This will give a rawhide which may answer. However, if it is desired to have the leather more perfectly tanned, after wringing out of the suds and before oiling, place in vessel and take sufficient water to cover, in which has been thoroughly mixed one pint of this mixture. "For a 12 pound calf skin take terra japonica, three pounds; common salt, two pounds; alum, one pound. Put these in a copper kettle with sufficient water to dissolve. Boil." Pour the water above referred to, which has been mixed with a pint of this mixture, over the skin. Every 12 hours take out the skin and add another pint of this tanning mixture. Do this three days, then add the entire amount which has been left of the tanning mixture. If it is desired to darken the leather add one pound of Sicily sumac. The leather should be handled often in this mixture. Drying should be gradual. Working with the hands as it becomes nearly dry aids in stocking the leather.

Tanning Calf Skin With Fur On

Can you give me a good recipe for tanning calf skin with hair on?—Subscriber, Santa Ana.

Tack skin, fur side under, on a board, and after scraping the bits of fat off, moisten all over and sprinkle with a mixture of seven parts salt and one of pulverized alum. Leave about two days to absorb the salt, then wet it again and repeat the mixture. About the fifth day wet it again and sprinkle with a mixture of two parts alum and one part salt. When dry it is cured and can be taken off the board.

Tomatoes in Water Glass

Is it possible to preserve and keep tomatoes in water glass similar to the method of keeping eggs?—Subscriber, Humboldt.

Facts!

You cannot deny them.

Motorists buy Zerolene because it is good lubricating oil; because it makes the car last longer.

More than half the motorists of the Pacific Coast states use Zerolene. Such approval is given only as a reward to a product of highest quality.

There is a Zerolene Correct Lubrication Chart for each make of car. Get one for your car at your dealer's or our nearest station. Use Zerolene for the Correct Lubrication of your automobile, truck or tractor.

Make Your Valuable Orange Crop Safe From June Drop and Fungus

Are you sure there is no Black or Citricola Scale in your grove, sapping the very life out of the trees that are setting what will be a burdensome crop?

Investigate for your own good. One Black Scale will produce 2000 to 3000 more, quickly spreading to healthy trees. Left alone it retards the growth of the tree and injures the fruit, sometimes lowering the grade considerably.

You can thoroughly clean your trees and eliminate Black and Citricola Scale, Red Spider and Fungus, if you will apply

TIZIT SPRAY

There is a grove near you where TIZIT has done all we claim for it. Send for the name and address of the nearest TIZIT SPRAY user so you can see the results.

The sooner you put TIZIT on, the more work it will do. The genuine TIZIT is labeled TIZIT—Trade Mark Registered.

Folder sent on postcard request

The Tizit Spray Manufacturing Company

1344 Willows St., Los Angeles, Cal.

Also may be ordered through The Fruit Growers Supply Co.

We have never heard of any effort along this line. It would be very easy to test it however. Will be glad to hear from any subscriber who has experience.

Rattlesnake Oil

How is rattlesnake oil extracted and prepared for market? What is the price of same and where may it be sold? May rattlesnakes be killed where found?—Subscriber, Bonsall.

We have never heard of any closed season on rattlesnakes. They may be killed freely at all seasons of the year. As to the extraction of the oil we have no knowledge whatever and will ask some of the hunters to give us information as to methods. There is no established market for the oil.

Walnuts Dying

We have some walnut trees along the highway which grew until the third year and then died in the winter, died from the tops down and turned white on one side of the tree.—Subscriber, San Jose.

Insufficient information is given to enable us to make definite answer; any condition which prevents the new wood from maturing will produce the above results. A shortage of water in the fall or an early frost that came before the new growth had matured, or very hot weather would have this effect. If the trees are cut off a few inches below the damaged wood and the most vigorous sprouts trained for a new tree there will not be much loss of time, but if the old conditions continue, the die back can be expected again.—J. B. N.

Bats

Our house is a Queen Anne cottage with a large attic. It was infested with bats, who made the most unearthly noises at night, until we got a tame squirrel. We let it loose in the house and it cleared the house of the bats.—Capt. H. H. Holmes, Alameda.

THE GAYULE RUBBER

At various times Californians have become interested in the gayule rubber plant, native to Northern Mexico and Southwestern Texas. J. W. Jeffrey, former state commissioner of horticulture, wrote much of the possible culture of this plant in the desert parts of California.

The plant, popularly called gayule in Mexico, is known to botanists as Parthenium argentatum, so named by our own Prof. Asa Gray. Even before the Spanish occupation the natives made toy rubber balls from the juice of this plant, the only member of the composite or sunflower family known to produce rubber. It is a woody shrub or small tree of spreading habit. It has small grayish leaves and bears a profusion of small yellow flowers.

The bark of trunk and roots contains 20 per cent of rubber, but no latex, or sticky juice, exudes when wounded, as is the case with other rubber producing plants. In the gayule the rubber is resident in the cells of the inner bark. The shrub, so far as known, is of slow growth, for it inhabits districts practically rainless, though it would doubtless grow much faster under the stimulus of more water. For that reason it should do well in the real desert sections of California and should be given a trial. Its native range is nearly grassless and contains no large trees, being a typical desert country with an alkali soil, but needing only water to make the region fertile and productive. The price for dried gayule plants has ranged from $7.50 to $50 a ton, but mostly at $15 to $20 a ton.—E. B.

THE PAWPAW IN AFRICA

The pawpaw is grown principally in Natal and the low veld of the Transvaal and is one of the most acceptable of fruits. In order to thoroughly appreciate it one ought to live in a thirly hot part of the country, where its nonappearance at breakfast or dessert always causes long faces. The tree grows readily from seed and bears fruit sometimes under 12 months from the date of planting. An average time before bearing is 18 months. Pawpaws are sold largely in Johannesburg, which is really the principal market of South Africa, and to a lesser extent in the town of Cape Province, where the fruit does not seem to be as well known as it deserves. It is an extremely profitable tree to grow, though there are few orchards of pawpaws.

SESAME SEED IN MEXICO

The average annual production of sesame seed in Mexico is 80,000 tons, practically the entire crop being consumed in Mexico, since local prices are higher than those offered by foreign buyers. Eighty-five per cent of the crop is produced in the eastern part of Michoacan, and the northern and coast regions of Guerrero. The sesame seed is used for oil, the first pressing producing an edible oil, while the product of the second pressing is used principally in the manufacture of soap.

GREEK CITRUS CROP

The citrus fruit crop of Greece for the year 1920 is estimated at 302,000,000 of the larger oranges and 53,000,000 of the Mandarin class. Government statistics of this crop are not available, but these data were gathered from reliable dealers in these fruits.

Citrons which are grown on the island of Crete appear to have been a failure, as information received from this island states that there will be no crop this year. However, there are still about 600 tons of citrons in brine left over from previous crops.

Plant Teague Trees

They Grow and Produce Valuable Crops

We can still supply Valencia Late Oranges, Eureka, Villa Franca and Lisbon Lemons for commercial planting.

AVOCADOS

Good thrifty field grown Fuerte and Sharpless Trees for immediate delivery.

FEIJOAS

Grafted from the best large fruiting varieties.

Write for our new descriptive price list describing forty-six varieties of Oranges, Lemons, Limes and Pomelos and seventeen varieties of Avocados and other Tropical fruits. It's free to those interested.

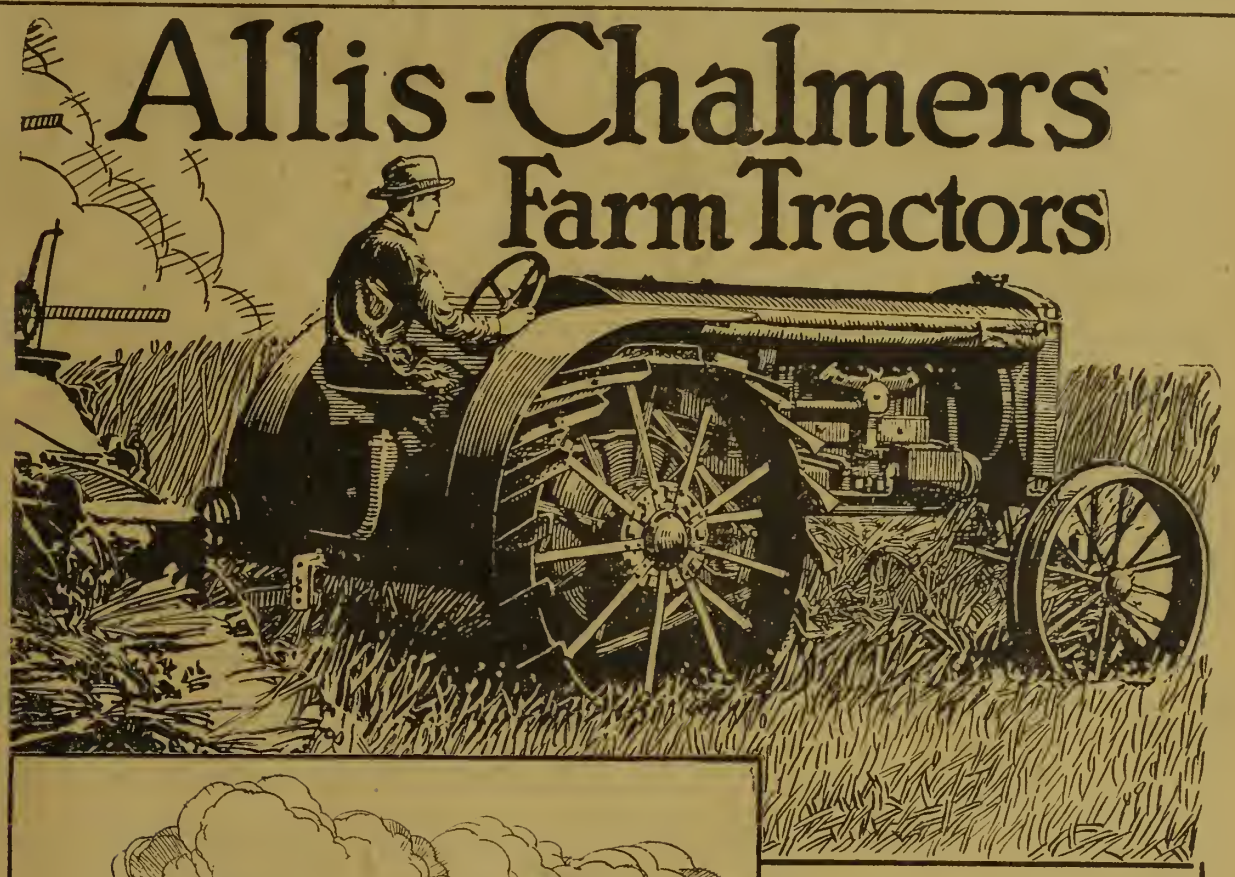
Allis-Chalmers Farm Tractors



Allis-Chalmers for Work and Economy

RECORDS from owners of Allis-Chalmers 18-30 Farm Tractors, show an average fuel consumption of slightly over two gallons an acre plowing; lowest 1¼ gallons; highest 2½ gallons—nearly all used kerosene.

Plowing depth shows 6¾ inches the average; deepest 9 inches; most shallow 5½ inches—nearly all pull four 14-inch bottoms.

One pulling three bottoms reports a plowing speed of one-half mile in nine minutes, plowing seven inches deep.

Read these statements taken from owners:

"Can't be beat for road work. I grade from 1½ to 2 miles in 10 hours on 25 gallons of gasoline."

"Certainly is fine on plowed ground. You can scarcely tell where the rear wheels go."

"Using an Ottawa C Sheller I threshed 10,000 bushels of wheat last season."

"I use my Allis-Chalmers 18-30 with the largest size McCormick Cutter."

"Pulling an Ottawa C Corn-Sheller, last season I shelled 7,000 bushels of corn."

"It has plenty of power to grind 100 bushels of ear corn per hour."

"Have pulled a corn-picker together with a wagon, husking 70 acres of corn, bringing in twelve and thirteen 40-bushel loads in a day. I pulled this load on high gear."

Allis-Chalmers Manufacturing Co., Tractor Division MILWAUKEE WISCONSIN

For 65 years known as one of the largest manufacturers of high grade machinery in the world

Pacific Coast Distributors: H. V. Carter Motor Co., San Francisco, Cal. — Smith Motor Co., Santa Ana, Cal. — Northwest Tractor Co., Everett, Wash.

We Are Offering for Quick Sale Two Tried Sires

California Jumbo Buster and Blue Valley King

These two boars have sired a class of Poland Chinas that have made it possible for us to secure an ever increasing patronage. Write us at once. We feel sure you will be interested.

A. Buckland & Son, R.F.D., Fresno, Cal.

Lendorris Liberty Bond, Skyrocket and Lendorris Liberator,

are our three herd boars.
They are a combination of the most popular blood lines and their individual excellence assures the purchaser of Poland Chinas the great size and quality desired by all. Our sow herd is in keeping with our three good boars.
A few choice individuals for sale at all times. We solicit your correspondence.

W. L. Haag and Son Hanford, Cal.

THE SEQUOIAN

One of the Largest Yearlings in the State, Heads My Herd

He is a young boar of great promise and bids fair to develop into a remarkable sire of big type Polands. Young stock of both sexes for sale at very reasonable prices.

Z. M. Dickey Dinuba, Cal.

Do You Know?

That the WESTERNER is a son of BIG BOB—the greatest sire of BIG TYPE POLANDS that the breed has ever known? The progeny and direct descendants of BIG BOB have won near 75 per cent of the ribbons at the National Swine Show since its origin?

REMEMBER that THE WESTERNER is a son of BIG BOB, the sire of sires.

ALEX. D. McCARTY. RIVERINA FARMS MODESTO, CAL.

Aviator A strictly big type boar that is siring a class of young Polands of the really big type. We expect to show this good boar and some of his get at the state fair this year. Satisfaction assured on any purchase you make of us.

CROSS BROS MERCED, CAL.

Trewhitt's Big Type Poland Chinas

have long been noted for their size and feeding qualities and have been bought by the leading breeders of the state for the improvement of their herds. Select your next purchase from a herd where you have the assurance of something better.

W. D. Trewhitt Hanford, Cal.

King's Big Bone Leader

is siring the big stretchy type of Poland Chinas sought by the discriminating breeder. He is assisted by Giant Bob 2nd, a son of the late grand champion and a pig of great promise.
Write for information. Stock for sale at all times.

Les McCracken Ripon, Cal.

McCune's Quality Herd

of BIG TYPE POLAND CHINAS

attained their prominence by a careful study of blood lines and individuality necessary to real constructive breeding. We produce the type you need in your herd. A few choice individuals for sale at all times.

H. D. McCUNE, Lemoore, Calif.

Sunny Side Farm

where efficiency is our watchword and the production of extra heavy milking Holsteins and big type Poland Chinas is our specialty. A few choice animals of either breed or sex for sale at all times at reasonable figures. Write for information.

R. F. Guerin Visalia, Cal.

Tulare Holsteins Average $400

May 6, 59 Holsteins consigned to the annual Tulare breeders' sale averaged $400, which was generally considered satisfactory by the consignors.

The top female was from the consignment of R. F. Guerin, Visalia, and was Cantate Wonder 3d, a 25.37 pound daughter of Arcady Pontiac Wayne Hengerveld. She was purchased by R. L. Holmes of Modesto, who has developed a habit of topping the Black and White sales, for $1,450. Sadie Maid Pontiac Segis, 24.28 pound daughter of Segis Pontiac Crane De Kol, topped the R. C. Sturgeon consignment, selling to W. J. Higdon of Tulare for $1,025. Lady Legathend, with a three year old record of 18.85 pounds, was sold by Sturgeon to Burr farm, Los Angeles, for $935, who also took the 23.66 pound Princess Hengerveld Orizaba from the same consignment at $800. A like price was paid by H. E. Cornwell of Modesto for Whitehouse Belle 2d from the Guerin herd. By far the heaviest buyer at the auction was G. M. Brown, manager of Burr Farm. This progressive institution selected 15 head of the better lots. A new buyer to make his appearance at a Holstein sale was E. Swift Train of San Francisco. Train, who is laying a foundation for a herd, secured six head. Other buyers at the sale included W. J. Higdon, Tulare; C. W. Gates, Corcoran; Alex Whaley, Tulare; H. E. Spires, Caruthers; C. V. Harris, Compton; P. M. Longan, Tulare; D. D. Elmore, Baldwin Park; J. E. Brown, McFarland; Frampton Bros., Artesia; J. L. Sebastian, Wasco; H. J. Angell, Los Angeles; H. Halff, Tulare; Fakler Bros., Lemoore; Chas. Harrington, Compton; J. W. Sturgeon, Lemoore; J. E. Jones, Visalia; G. W. McNear, San Francisco, and V. S. Scott, Reno, Nevada. Professor Scott is connected with the dairy division of the University of Nevada and has been active in inducing Nevada dairymen to use better blood.

The sale was held in the new Tulare sales pavilion and was managed by The California Breeders Sales and Pedigree Company of Sacramento. C. L. Hughes was in the box. Ben A. Rhoades of Los Angeles wielded the hammer and he was assisted in the ring by Col. Geo. W. Bell of Tulare.

Consigned by R. C. Sturgeon, Tulare

FEMALES

1, Sadie Maid Pontiac Segis, July, 1916, 24.28 pounds; W. J. Higdon, Tulare, $1,025.

Prices Based on Actual Merit

By Frank D. Tomson

There is one question that is probably asked more frequently, of men in close contact with the purebred livestock industry, than any other. It is this: "Don't you think the prices are too high?" As a rule, this question comes from men not as yet closely connected with the business, if at all. They seem always to take the position that the actual value is not there; that the prices paid are advanced by men too enthusiastic in their estimates.

Perhaps it would surprise some of these questioners to know that over in the British Isles, where cattle improvement has been going on for several centuries, values generally adhere to a higher level than in this country. In a recent auction sale in north England, between 15 and 20 high g[illegible] cows sold for an average of ap[illegible]roximately $800. This was before th[illegible] slump in the purchasing power of t[illegible] pound sterling. These cows were all well bred and no doubt carefully selected, but they were not registered and, of course, it could not be expected that they would sell for as good prices as if pedigreed.

Another question frequently heard. It is, "Don't you think the business is being overdone?" Certainly this record just referred to furnishes the answer. There are, undoubtedly, more pure bred cattle in the British Isles to the quarter section than there are in this country to the square mile or even to the township, and the values generally adhere to a higher leve[illegible]

than in this country. Right here some one questions, "If that is true, how does it happen that importers can bring in cattle from the British Isles and sell them and make a profit?" The answer is that a class of breeders in this country in quest of seed stock will pay a premium in order to get it and assume that these importations are of the class of seed stock desired. But, in the main, the level of values for pedigree and non-pedigree cattle in that little country is higher than in our own.

As a matter of fact, we have only gotten well started here in this wonderful country in livestock improvement, in the general adoption of improved livestock by farmers and ranchmen and a general effort to work improvement therein.

The value of a pure bred animal lies in its power to work improvement inherited from its ancestors. The better the ancestry, the more certain the power to bring about the improvement in succeeding generations. The man who recognizes the existence of this prepotency; the man who is a judge of individual conformation and is informed as to the comparative merit of the ancestry, will always have the advantage in the business of breeding pure bred livestock, and the making of the largest success out of the business of agriculture.

The land, which 20 years ago remained unoccupied and untilled, has today, to a very large extent, come under private ownership and operation. Not only this, but the farms that have been under operation are, with comparatively few exceptions, showing a decrease in producing power. This condition has come about chiefly because of lack of livestock, with the result that the fertility has been taken from the soil. It may require long years to restore it.

While this process has been going on there has been a steady increase in the populations in the cities and the towns which relies on the products of the farms for something to eat and to wear. Probably the day is not far distant in this country when 75 per cent of the inhabitants will reside in cities and towns. None of these will lend a hand toward food production, but all are consumers. The ratio of the producers on the farms to the non-producers in the cities grows smaller and smaller each decade. This simply means that the call for the products of the soil will steadily increase and the tillers of the soil may look with confidence toward the permanency of the industry and the assurance of profits to all who wisely and methodically carry on the business of producing this food. That the call for improved livestock is on a permanent basis there can be no question. The one possible weakness is that the farmer himself may not carry on this business with a view to permanency, for if he fails in this he overlooks one of the greatest opportunities that confronts him.

UNIFORM WOOL GRADES SOUGHT

Tentative types representing various grades of wool have been prepared by the bureau of markets, United States department of agriculture, in connection with its investigational work looking toward the ultimate establishment of uniform wool standards. The types decided upon by government experts have been prepared after careful examination of thousands of samples that represent the opinion of the trade generally as to what should comprise wool standards, and which now form the basis of commercial transactions.

There are now no fixed wool grades in universal application, with the result that the purchase of the producer's product is based upon arbitrary standards fixed by individual buyers. It is therefore obvious that to place the business upon a uniform basis would be decidedly advantageous to all concerned.

AYRSHIRE BREEDERS ANNUAL

The 45th annual meeting of the Ayrshire Breeders Association will be held at Springfield, Massachusetts, on June 9, and the National Sale on June 10.

BEGGING THE QUESTION

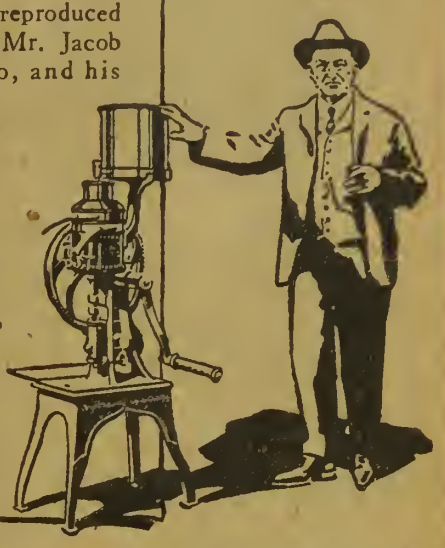
She met him in a darkened room,
Said he, "I've brought some roses?"
She answered with irrelevance,
"Oh, dear! how cold your nose is!"

DURABILITY OF THE DE LAVAL

This illustration is reproduced from a photograph of Mr. Jacob Rimelspach, in Ohio, and his DeLaval Separator, which has been in use for over 25 years.

The machine was brought in on a local De Laval Service Day to be looked over by the service man.

There was nothing the matter with the separator, and after it was cleaned up and oiled Mr. Rimelspach took it home with the comment that it ought to be good for another 25 years.



The De Laval Separator gives the greatest value for the money, because it gives better and longer service. Mr. Rimelspach's experience is equaled by the records of a large number of De Laval machines.

Considering its greater durability alone, the De Laval is the most economical separator to buy; and with its cleaner skimming, easier running, greater capacity and unequaled service, the price of a "cheaper" machine is high in comparison.

If you don't know the De Laval agent in your community, write to the nearest De Laval office

High Lights on Recent California Holstein Sales

Chas. S. Harrington, Compton, who is gradually replacing his grade females with pure breds, has been a consistent buyer of top stuff this spring, and also had the distinction of selling the top of the sale at Clearwater on April 27, when a bred heifer consigned by him fetched $1,025.

An outstanding feature of the spring sales has been the buying activity of Southern California breeders. Over 70 separate breeders made purchases ranging from one head up to over 50, and the selections include many of the very top animals offered. The presence of such a wealth of top Holstein blood in the hands of so many different breeders in the southern territory indicates something of the tremendous development that may be expected in the south half of the state within the next few years.

Ernest Otto McClure, Santa Ana, succeeded in picking up a choice lot of heifers during the spring sales. While his ranch is largely given over to sugar beet production, he will have a considerable sized herd of registered Holstein heifers to drop their first calves within the next 18 months, and will once again have a high class producing and breeding herd.

F. F. Pellissier, Whittier, widely known as the owner of one of the best herds of high grade Holsteins in America, has made a beginning with pure breds, tops from several sales having been selected by his son, F. S. Pellissier, who was a gold medal winner in the Holstein judging at university farm last year.

Clyde S. Kennedy, Hemet, secured an outstanding female at the Clearwater sale in Aralia Rose, a 24 pound three year old granddaughter of Prince Gelsche Walker, selected from the A. J. Stalder consignment at an even $1,000.

The consistently high production records being recorded by first calf daughters of Sir Veeman Korndyke Pontiac have made the offspring of that excellent young sire an attraction in every sale in which they have appeared up to date. One of his daughters topped the two year olds in the Guaranty Sale; another topped the yearling heifers at Clearwater, and in the same sale one of his young sons topped the bull calf list. The daughters of this sire are being developed by R. F. Guerin, Visalia, while the bull himself is now owned by Burr Farm, Los Angeles, in which herd he will divide service with the $12,000 bull King Korndyke Pontiac 20th.

R. L. Holmes, Modesto, is assembling a herd of well bred high record females that are of outstanding individuality, a point that Mr. Holmes keeps prominently in mind whenever he makes a selection. The fact that he secured the top priced female in five consecutive sales at prices ranging up to $2,300 is something of an indication of the female end of his herd at present. On another page will be found an item of his purchase of the great young sire Segis Pontiac Abbekerk to head these females.

Robt. T. Curtis & Son, Exeter, secured what was rated generally as the greatest female bargain in the W. J. Higdon sale when he took home the great 34 pound four year old Coloma Beauty Butter Maid at $1,750. She is due to calve in July to the service of the $12,000 bull King Korndyke Pontiac 20th.

The value of popular breeding was perhaps never better illustrated in California than in the 20 daughters of Prince Riverside Walker in the W. J. Higdon sale. These heifers, all yearlings and two year olds, granddaughters of Prince Gelsche Walker and Aaggie Acme of Riverside, two of the most popular lines of breeding in the West, sold for an average of $658, with a top price of $1,350, indicating a most uniform range of values, and it was the opinion of ringside breeders that they all sold well within their value.

Stockton State Hospital, Stockton, was represented at several of the spring sales by W. H. Chestnutwood, business manager, and by W. J. Foley, in charge of the dairy herd. They succeeded in securing a number of richly bred females in the W. J. Higdon sale, and secured a real bargain in the young bull King Korndyke Pontiac Leda at $800. He is by the $12,000 bull King Korndyke Pontiac 20th and out of a 30 pound daughter of Korndyke Queen De Kol's Prince, second dam a half sister to Tilly Alcartra.

Anita M. Baldwin, owner of Santa Anita Rancho, Santa Anita, was represented at several sales by Earl Sturgis, manager of the livestock department, and secured many of the choicest daughters of Prince Riverside Walker in the W. J. Higdon sale. These fit in splendidly with the choice herd at Santa Anita, which carries a preponderance of the blood of Prince Gelsche Walker.

Allison & Storm, Tulare, bought a real herd header in the W. J. Higdon sale when they took home the young bull King Korndyke Paula Segis at $1,125. He is by the $12,000 bull King Korndyke Pontiac 20th and out of a 30 pound daughter of Sir Ormsby Burke Segis, second dam a daughter of Sir Hengerveld De Kol Ormsby.

A two year old daughter of King Segis Alcartra Prilly, the Bridgford three times grand champion, found plenty of admirers in the Higdon sale, and after spirited competition fell to the $975 bid of Stockton State Hospital.

An average of $580 for 20 milking females and six heifers, the entire offering of females in the I. B. Van Blaricon dispersal at El Monte on May 8, marked the most successful dispersal of a small herd in California to date The top of $1,200 for a 26 pound four year old was paid by Chas. S. Harrington, Compton.

The Third Tulare Sale, May 6, was topped by Cantate Wonder 3rd, consigned by R. F. Guerin, Visalia, sold for $1,450 to R. L. Holmes, Modesto. She is only a five year old cow, with a record of 25.37 pounds butter in seven days made at last freshening. Three of her daughters sold in the Guaranty Sale last March for a total of $2,225, including the top two year old S. V. K. P. Claire of Sunnyside, the highest record daugbter of Sir Veeman Korndyke Pontiac. Mr. Guerin still has her last heifer calf in his herd.

R. C. Sturgeon, Tulare, secured an average of around $450 for his females of milking age in his semi-dispersal on May 6, and a grand average of over $400 for his entire consignment, which was a very desirable one throughout, although many of the cows had not been given official records.

H. E. Spires, Caruthers, made his initial consignment at Tulare on May 6 and realized the nice average of $462 on the four females consigned, the top of $725 being realized on a 16 pound two year old granddaughter of Segis Pontiac De Kol Burke.

Buyers of bulls backed by high production found an unusually acceptable selection in the Leeman & Kilgore dispersal at Ripon, and moderate prices were much in evidence Two exceptionally good values were secured by P. Brunold, Modesto, when he secured King Pontiac Sarcastic Korndyke for $700 and Sir Aaggie Goldstone Pietertje for $160. The former is a son of King Korndyke Pontiac 20th out of a 22 pound dam, and the latter a son of Sir Aaggie De Kol Acme out of a 22 pound dam Both of these bulls are high class individuals.

R. Stevens, Stockton, made a keen buy when he took Miss Gelsche Walker Korndyke at $1,125 and her yearling son King Gelsche Walker Korndyke at $875 in the Leeman & Kilgore dispersal. The former, a 32 pound daughter of Prince Gelsche Walker, is on yearly test with 426 pounds butter to her credit in 128 days, and over 11,000 She is making this production with the end of one teat cut off, a blemish that affected her selling price by several hundred dollars and which is not interfering to any great extent with her production.

H. A. De Wolf, Ripon, made his greatest purchase to date in the Leeman & Kilgore dispersal. He secured

Study This List Carefully and Come Prepared to Buy Them at Your Own Price

ALCARTRA KING SYLVIA, the youngest son of Tilly Alcartra, sired by the $106,000 bull.

MISS ARALIA DE KOL AAGGIE. She and her 100 per cent sister, also consigned, are the only sisters in the world with seven dams averaging over 1,100 lbs. butter in a year.

RUBY PIETERTJE OF FOREST HILL 2D, 39 lbs. butter in seven days, 162 lbs. in 30 days as a senior 4-year old. Her 30 day record is the largest ever made on the Pacific coast at any age. Gave 118 lbs. milk in a day. In calf to a son of Tilly Alcartra.

KING KORNDYKE PONTIAC ACME, yearling son of Miss Aaggie Acme Burke, world champion junior two-year-old for milk production.

KING PRILLY SEGIS PONTIAC, son of Spring Farm Pontiac Maid 2nd with 35.66 lbs. as a senior 4-year-old. His first twelve dams average over 32 lbs. in seven days.

BOWEDA ALCARTRA PRILLY, daughter of Boweda, 37.61. Sired by California's grand champion show bull.

HOLLYWOOD LILITH MERCENA, 38.91 lbs. butter, 729 lbs. milk. Champion cow of the northwest. In calf to Judge Segis.

HOLLYWOOD GLEN ALEX SEGIS, a son of Judge Segis and Glen Alex Queen De Kol, world champion 42-lb., two-year-old, whose dam also has over 42 lbs., and has produced two 42-lb. daughters.

COUNTESS OF SUNNYSIDE DE KOL 2D, senior and grand champion cow at the Pacific International. In calf to Judge Segis.

AURORA FOBES FAYNE DE KOL 3D, 31-lb. 3-year-old sister to Lady Aaggie Echo Hengerveld who has recently made over 30,000 lbs. milk in a year.

ENSIGN PONTIAC THE GREAT, son of Canary Spofford Empress 2nd with 31.63 lbs. butter from 665 lbs. milk and a 10 month's record of over 700 lbs. butter as a two-year-old.

CARNATION KING DE KOL, son of Carnation King Sylvia from Inka Princess Mutual De Kol 2d, 30.14 as a 4-year-old, her dam a 33-lb. cow.

CARNATION ECHO TIETJE, a son of Champion Echo Sylvia Pontiac from Idleaze Pontiac Lass, 42.28 as a 4-year-old. The highest record living daughter of King of the Pontiacs.

NENA NEWMAN CORNUCOPIA, former world record 3-year-old in both the seven and 30-day divisions.

This Will Be the Greatest Holstein Sale Ever Held

Some of Its Special Features:

254 Head	122 Consignors
45 30-lb. Cows	6 1000-lb. Cows
75 from 30-lb. Dams	25 from 1000-lb. Dams

The highest yearly record bull in the world for his two nearest dams.
The champion cow of the northwest.
The champion cow of the Empire State.
The world record 3-year old in the 30-day division (Pabst Korndyke Cornflower).
The only two heifers in the world with an average of over 1,100 lbs., for their seven nearest dams.
The youngest son of Tilly Alcartra, by Carnation King Sylvia.
The only heifer in the world backed by four direct generations of 1,000-lb. dams.
The only heifer in the world to have made three 30-lb. records in heifer form.
The Minnesota state champion 4-year-old.
A son of the world champion long distance two-year old for milk production.
A son of the highest record living daughter of King of the Pontiacs.
Three bulls backed by three generations of 1,000-lb. dams.

Sale will be held at the Minnesota State Fair Grounds, which is located midway between the cities of Minneapolis and St. Paul, and will start at 9:00 promptly each morning—June 3-4-5

Raise Guinea Pigs
FOR US

We supply stock and buy all you raise. Laboratories need thousands, big money, easy to raise. Particulars and book 10c, nothing free.
DR. J. A. ROBERTS LABORATORIES
Hollywood, Cal.

KEEP THE PIG FREE OF LICE

Hog lice are so easily held in check that it is nothing short of carelessness when the hog raiser suffers loss by them. He should remember that lice weaken the pig and make it more apt to die of disease, and that when he feeds a lousy pig, he is feeding lice also.

Crude oil is the most effectlve remedy for hog lice. It not only kills the lice, but destroys the nits or eggs, as well. It is also a good remedy for mange.

Kreso dip is a very good remedy for lice, but it does not destroy the eggs.

Coal oil kills the lice and destroys the eggs, but it is apt to blister the pig. When used with about half of lubricating oil, it is more satisfactory.

Methods for Applying Remedies.

The dipping vat affords the ideal way of applying remedies for lice, but it is not practical, except with large herds of hogs. The oil floats on the water, and all that is necessary is to pour on about five gallons aud drive the hogs through it.

Pour the oil on the water in the pig's wallow.

Make a sand wallow ln a sheltered, well drained place, and saturate the sand with the oil. Pigs soon learn to enjoy wallowing ln the oily sand.

Oil may be applied with a mop or a brush.

When the oil ls not too heavy or thick, it may be applied with a common water sprinkler.

34 POLAND HERDS IN FUTURITY

The following Poland China breeders, 34 in all, have nominated their herds for the futurity show to be held at the California state fair: Bassett Bros., Hanford; M. Bassett, Hanford; Geo. V. Beckman & Sons, Lodi; John M. Bernstein, Hanford; Mrs. Alfred Buckland, Fresno; A. Buckland & Son, Fresno; W. L. Choisser, Riverdale; J. H. Cook, Paradise; M. B. Cross, Merced; Chas. E. Dack, R. H. Box 196, Fresno; De Forest & Horr, Susanville; J. A. Crawshaw, Hanford; W. T. Dice, Hanford; Z. M. Dickey, Dinuba; A. J. Elliott, Tulare; Fred Gatewood, Fresno; Johnnie Glusing, Minton; Fred D. Grant Jr., R. K. Box 46, Fresno; W. L. Haag & Son, Hanford; N. K. Horan, Lockeford; H. A. Johansen, R. H. Box 260, Fresno; J. F. Lehman, Lodi; Alex D. McCarty, B. 2250, San Francisco; Les McCracken, Ripon; Earl McCune, Lemoore; H. D. McCune, Lemoore; H. I. Marsh, Modesto; C. Roy Marshall, Sebastopol; E. S. Myers, Riverdale; Viola L. Renwick, Hollister Ave., Santa Barbara; Fred D. Ross, Hanford; H. C. Shinn, Tulare; W. D. Trewhitt, Hanford; W. A. Young, Lodi.

PRICKLY PEARS

The department of agriculture is issuing Farmers' Bulletin 1072, "Prickly Pear as Stock Feed." The bulletin touches upon the importance of prickly pear in semi-desert sections and the ease with which it may be produced upon comparatively worthless land. It calls attention to the fact that while of extremely low feeding value in itself, it is "green and succulent and admirably adapted to produce good condition in cattle when used with dry feeds.' The method of planting is to lay the slabs on the ground in straight rows and partly cover by plowing alongside. Of course, to make it fit for stock feed two general methods have been employed. The more economical has been to singe the plants with a gasoline torch and allow the livestock to graze where they stand. Another has been to put the unsinged plants through a chopper. This results, however, in occasional injury to the animal because of the spines not being cut with the knlfe. The bulletin denies that the so-called "spineless" will revert and become spiny. This, of course, refers to reproduction of the same plant by cuttings. If seed from the spineless plants drops and starts a new plant, it is usually claimed that there is possibility of reversion and extremely spiny plants coming

E. B. and H. Potler, Santa Barbara, have at head of their herd of Poland Chinas the big young boar, Big Longfellow Price, got by the 1200-pound boar, Longfellow Prlce. This young boar was bought from the Renwick herd.

SELECT STALLION AND BROOD MARE CAREFULLY

There is a great scarcity of high class, efficient horses and mules and a strong demand and good prices for that class. The demand and the price for the mediocre work animal, on the other hand, are low. This should emphasize the necessity for the greatest endeavor to reduce the number of inferior horses produced. If the right kind of horses and mules, the kind for which there is always a market, is to be produced, the same care must be glven to their productlon as is given by the breeders of cattle. sheep and swine.

What is needed more than anything else in the production of our work stock ls greater care in the selection of both the stallion and the brood mare. It ls a losing proposition to breed a poor producing brood mare. even to the best stallion, or to breed the good producing brood mare to an inferior stallion, wlth the hope that a good foal may be produced. While occasionally a good one will be produced in this way, the results in most cases will be disappointing, and a foal will be born that will not mature into a work animal valuable enough to pay for the cost of the feed and care necessary to ralse the foal properly.

It is a fact that many progressive farmers balk at paying a reasonable service fee for a good stallion and will breed to an inferior stallion because of the lower fee. It is false economy to stop at a few dollars when it comes to the best horse. It is the colt, and not the high service fee, which counts most in reckoning profits. It costs but little more to raise the $250 kind than lt does the $125 kind.

The estlmates of the bureau of crop estimates show a decrease of 373,000 in the number of horses on farms January 1, 1920, as compared with January 1, 1919, and an increase of 41,000 mules, or a net decrease of 332,000 head in our work stock. Indications are that there was a still further decrease in the number of mares bred in 1919. The effect will not be fully felt until about 1923, or when the foals born in 1919 and 1920 have become of workable age. In many sections the work stock is being used up without any provision for the future.

MAKE EVERY FARM FEED ITS STOCK

The production of enough feed for the livestock is second in importance only to producing food for the family. Farm management studies in the southern states indicate that the most profitable farms not only produce the necessary farm feeds but have a surplus of them to sell and that the livestock is usually of better quallty and better grade on the farms producing a surplus than on farms where staple feeds are bought. These facts are brought out in a series of 16 tests formulated by the department of agriculture to show whether or not a farm is being efficlently managed.

The average farm family requires for its proper maintenance two cows, 40 fowls and one pig for each adult. Enough calves should be raised to replace each cow reaching the age of elght years. Thls family livestock, it is calculated, will requlre one ton of corn and cob meal, 1.234 pounds of cottonseed meal, 55 bushels of corn, 40 bushels of oats, 4,200 pounds of cowpea hay, 2,100 pounds of oat hay, 4,200 pounds of corn roughage, green forage from two acres, and five acres of pasture or their equivalent. A fair provision to a head for work stock is 60 bushels of corn, 40 bushels of oats, and three tons of roughage.

HOGS SELL WELL

The California farm bureau marketlng associatlon at its recent Tulare sale sold nine cars, or a total of 707 hogs. The lowest price was for a small lot of 31 heavy weights; in fact, they averaged 347 pounds. From prlces secured it seems the favorite weight was around 200 to 250 pounds. Two lots, one of 88 and one of 71 hogs, the former averaging 193, the latter 252, both brought $15.80.

Twelve thousand cows contrlbuted a day's work to make the biggest cheese in the world. It was exhlbited recently at the National Dairy Show at Chicago. The cheese weighed 357 500 pounds, was eight feet high and 10½ feet ln diameter.

TESTIMONIALS

"Cows Increased In one week 3 per cent in milk."
A. L. McCULLOCH, Alpaugh, Cal.

"I never saw hogs do so well or grow so fast as on this molasses ration."
C. H. HARTWIG, Yuba City, Cal.

"It has enabled me to keep my stock in better condition at less expense."
J. M. HENDERSON, JR., Sacramento, Cal.

"Have one calf that refuses to drink new milk—prefers skimmilk with molasses. What do you know about that?"
R. HECKLEY, Santa Rosa, Cal.

"It has been a great advantage in getting the stock to clean up the roughage."
H. H. AMES, Chowchilla, Cal.

The Saving Point

The purpose of any silo is, without doubt, to reduce feed bills. Each year there is saved the difference between the cost of silage and the cost of dry feed, which we will call the dividend. In a number of years the accumulated dividends will equal the initial cost of the silo. Not until this point is reached does real saving begin.

Although this point is reached quicker where there is a low initial cost, the same quality which permits low initial cost—inferior construction—prevents the life of the silo from extending beyond the saving point, resulting in actual loss instead of savings.

The California Redwood from which the Ideal Green Feed Silo is constructed is noted for its lasting qualities. The tongue-and-groove staves and airtight refrigerator doors make leakage mechanically impossible. The heavy steel hoops, placed with mathematical precision where pressure demands them, give strength and stability.

With feed saving essentially dependent upon the life of the silo, is it not to your advantage to investigate the Ideal Green Feed Silo, built for year after year of serviceability? The coupon will save writing a letter for more information. Mail it today.

DISPERSAL SALE

A Beautiful Herd of Young Registered Holsteins

67 Registered Cows and Heifers
3 Registered Bulls

Edgemont Farm, Burbank, Cal.

C. W. Anderson, Owner

Thursday, June 17, 1920

This is one of the finest herds we have sold in California, containing a group of young cattle, from open heifers up to young cows with official records above 26 pounds butter in seven days, that is remarkable for uniformity of type, breeding, and size. This is also without question one of the cleanest lots of cattle ever offered in the west. The foundation females were purchased from a herd that has an unsurpassed history of good health, and when brought to Edgemont Farm were turned into paddocks and pastures made on new ground on which no cattle had been before. They have all been tuberculin tested by the subcutaneous method, just recently, and will be sold subject to retest by the buyer. The sale contains:

17 DAUGHTERS OF BERYL LUECKE DE KOL
He is a proven sire with 17 daughters in the A. R. O. list with records up to over 19 lbs. butter in seven days as two year olds.

12 DAUGHTERS OF RODERICK LINCOLN
One of the great bulls of the West, with 37 A. R. O. daughters, two of them above 30 lbs. butter in seven days.

7 DAUGHTERS OF ABYLA WITKOP
A wonderful group of young matrons of extraordinary type and splendid production.

13 DAUGHTERS OF DUKE BANOSTINE BUTTER BOY
He by a son of Friend Hengerveld De Kol Butter Boy and a daughter of Pontiac Aaggie Korndkye, and out of a dam that made 623.05 lbs. butter from 15,427.7 lbs. milk in 305 days.

ALSO SOME SPLENDID DAUGHTERS OF
KING SEGIS PONTIAC JANNEK, KING SEGIS PONTIAC, MERCI LAD KORNDYKE BURKE, PRINCE GELSCHE WALKER, ARALIA DE KOL PONTIAC MEAD, JULIANA KING REPEATER, KING PAUL KORNDYKE VALE, RODERICK ARALIA DE KOL PONTIAC MEAD.

Every animal positively guaranteed to be a breeder; every animal over six months of age tuberculin tested and sold subject to retest by the buyer.

LEEMAN & KILGORE HOLSTEINS DISPERSED

The strength of the Holstein market was again demonstrated when on May 12 the Leeman & Kilgore herd was dispersed at Ripon. Aside from the small bull calves, the general average was $436 on females and $371.50 on bulls.

W. J. Higdon of Tulare topped the sale when he paid $1,350 for Florence De Kol Mead, a two year old daughter of King Mead of Riverside. This young thing is a heifer of great promise and sold quite within her value. Higdon also took Cobossie Korndyke Mead, a yearling daughter of King Mead of Riverside, at $1,100 and the aged cow, Molly De Kol Pontiac Mead, a 25.56 pound daughter of Segis Pontiac De Kol Burke and out of a daughter of the sire of his top purchase.

One of the heaviest buyers and, at the same time, a critical buyer, was H. A. De Wolf of Ripon, who selected eight of the better females. Among the De Wolf purchases were: Fayne Spring Farm Pontiac De Kol, a 29.42 pound daughter of Spring Farm King Pontiac 6th, at $850; the 27.56 pound Laura Netherland Skylark at $750; Miss Cornucopia Colantha, Clothilde De Kol of Linwood, and Prulla Creamelle Johanna, all 24-pound cows.

R. L. Holmes of Modesto further strengthened his herd through the purchase of Merci Pauline Burke De Kol, a 29.19 pound daughter of De Kol Hengerveld Burke, at $900 and Pet Salambo Alcartra, a yearling daughter of King Morco Alcartra and from the 33 pound cow Pet Salambo of Riverside, at $650. Holmes has figured as one of the best buyers at the spring sales and his selections have been such as to attract much favorable comment.

One of the outstanding purchases of the sale was made by R. Stevens of Stockton, who got Miss Gelsche Walker Korndyke, a 32.79 pound daughter of Prince Gelsche Walker, for $1,125. She also has to her credit 426.6 pounds butter from 11,156.5 pounds of milk in 128 days.

One of the best buys of the spring series was registered when Mr. Stevens got the November 1919 son of Miss Gelsche Walker Korndyke and King Morco Alcartra for $879. This youngster is a promising herd bull prospect. Another outstanding bargain fell to P. Brunold of Modesto, when he got the yearling son of the $12,000 King Korndyke Pontiac 20th, King Pontiac Sarcastic Korndyke, for $675. This youngster is not only well bred but is a real show prospect.

The sale marked the closing of the partnership existing between Messrs. Leeman and Kilgore for a number of years, during which time they have earned the confidence and respect of the Holstein fraternity.

The dispersion was managed by C. L. Hughes of the California Breeders' Sales and Pedigree Company, Sacramento. Col. Ben A. Rhoades of Los Angeles occupied the box and Col. Geo. W. Bell of Tulare worked the ringside.

A representative list of sales follows:

FEMALES

3. Miss Gelsche Walker Korndyke, Aug., 1914; 32.79 lbs.; R. Stevens, Stockton, $1,125.
4. Fayne Spring Farm Pontiac De Kol, June, 1914; 29.42 lbs.; H. A. De Wolf, Ripon, $850.
5. Molly De Kol Pontiac Mead, Feb., 1914; 25.56 lbs.; W. J. Higdon, Tulare, $975.
6. Laura Netherland Skylark, Oct., 1911; 27.56 lbs.; H. A. De Wolf, $750.
7. Merci Pauline Burke De Kol, Oct., 1913; 29.19 lbs.; R. L. Holmes, Modesto, $900.
8. Pet Salambo Alcartra, June, 1919; R. L. Holmes, $650.
9. Clothilde De Kol of Linwood, Sept., 1915; 24.12 lbs.; H. A. De Wolf, $625.
11. Miss Cornucopia Alcartra, May, 1919; H. A. De Wolf, $275.
12. Stella Pietje, Aug., 1910; 22.88 lbs.; J. E. Headley, Ripon, $310.
13. Stella Pietje Alcartra, June, 1919; Burr Farm, Los Angeles, $175.
14. Blanche Hengerveld of Nevada, April, 1913; 26.08 lbs.; H. A. De Wolf, $550.
15. Blanche Hengerveld Alcartra, Feb., 1919; H. A. Belgum, Richmond, $190.
16. Gamman Sarcastic of Linwood, Jan., 1914; 22.10 lbs.; Earl Graham, Compton, $510.
18. Model Alban Segis Princess 2d, Feb., 1915; 19.77 lbs.; A. C. Van der Acker, Ripon, $400.
19. Empress Hell Pontiac, Nov., 1914; 16.81 lbs.; Geo. M. York, Modesto, $310.
20. May Korndyke Sadie Vale, Feb. 27, 1917; H. A. De Wolf, $325.
21. May Paul Korndyke Sadie Vale, Sept., 1919; W. H. Byron, Peterson, $175.
22. Pascoe Segis Pontiac, Dec., 1916; 13.82 lbs.; H. M. Belgum, $210.
23. Florence De Kol Mead, July, 1918; W. J. Higdon, $1,350.
24. Cobossie Korndyke Mead, April, 1919; W. J. Higdon, $1,100.

Facts in BLACK & WHITE

Purebred Holstein Cattle Save Labor

Whatever the amount of milk or butterfat you wish to produce, is it not better policy to use large-yield cows than to feed and shelter the necessarily greater number of small-yield cows? Use Holsteins and you save labor, feed, stable-room, equipment and risk. They are always healthy and ready for work. Choose cows according to their capacity for converting coarse feed into milk. That is the function of a dairy cow, and that is where the big Holstein excels.

Send for Free, Illustrated Booklets They contain valuable information for any Dairyman.

Poland Chinas

August 21, Merced County Poland China Breeders' Association, Merced.
September 27, Hugh C. Shinn, A. J. Elliott and Alex D. McCarty, Tulare.

The Merced County Breeders Association held a meeting Saturday, May 8, and perfected the constitution and by-laws and elected David Larson of Stevinson vice-president and the following board of directors: E. W. Doane, Merced; Paul Mitchell, Atwater; J. Paxton, Athlone; J. H. Bowles, Merced; F. A. McConnell, Livingston; with President J. F. McSwain and Secretary E. E. Greenough as ex officio members. There are also plans under consideration for an intensive sire campaign and also an advertising campaign.

Predictions have been ventured that the show of Shorthorns at the state fair this fall will be one of the strongest ever made in the state. W. M. Carruthers, veteran breeder of Live Oak, is enthusiastic over a number of young things that he is having fitted. He will show senior calves, most of them the get of Count Glory. Several of the calves are out of Fond Lavender dams, making them line bred descendants of Whitehall Sultan. His calf herd will attract attention.

Les McCracken of Ripon reports that his Poland China herd is in fine condition and that he is planning to hold a sale of bred sows some time in August, the exact date to be announced later. He expects to sell about 40 head that he will select from the 100 sows now on the ranch.

The sale offering of Durocs from the Elmer Lamb herd is rounding into shape. Included in the sale, which, by the way, marks the closing out of one of the pioneer herds of this state, will be the great sow, Mary Jane Pathfinder.

The first registered Holstein calf club to be organized in this state has been started at Live Oak. The club was organized by County Farm Advisor C. E. Sullivan and O. W. Jarvis, agricultural agent for the Sacramento Bank. The following boys and girls are members of the club: Lucius Davis, John Wahlstenholm, Dorothy Strom, Kenneth Vantrees, Hosea Hershym, Vilas Cobeen, Horace Vantrees, Vourls Roulsten, Vernon Cobeen, Teddy Cobeen, Charles Vantrees, Alfred Vierra, Harold Cobeen, Raymond Jenkins, Evelyn Reber, Everett Chamberlain, Wilhur Rutherford, Floyd Wohlstenhoim, Thomas Smith Jr., Louis Farrar and Bruce Jenkins. James Henderson Jr. of Sacramento, who furnished the heifer calves, also donated the club a young son of King of the Black and Whites. The heifers are to be bred to this bull and the members agree to place his daughters on test as they freshen, thus adding to the value of the heifers and at the same time increasing the prestige of the bull.

The California Wool Growers Association is planning a ram sale to be held at the universary farm June 24-25. This will be the first sale of the kind ever held in California, and owing to the fact that there are in this state many of the leading flocks of the West, it is expected that the sale will attract sheepmen from a very wide territory. Professor James F. Wilson of the college of agriculture is in charge of the arrangements.

W. S. Guilford has presented a number of his friends a very beautiful enlarged picture of a group of Shropshires in pasture. Guilford says that the Butte City flock has recently shipped Shropshires to a number of Western states. It is possible to produce a larger type of sheep in California than anywhere else.

Geo. V. Beckman & Son, Lodi, report the recent sale of a good fall boar by Liberty Bond at a good figure.

J. F. Lehman, Lodi, has one of the largest litters seen this season from his senior yearling sow Evergreen Hutch and sired by Evergreen Model. This futurity litter, together with their dam, will be included in the Lehman show herd this season.

Alex D. McCarty of Riverina Farms, Modesto, announces that he has bought the interest formerly owned by Mr. Starkweather and that E. F. Curtis, formerly with Alexander & Kellogg, Suisun, will have charge of the herd. A consignment from the McCarty herd will be included with those from the Shinn & Elliott herds to make up the sale offering for September 27. From present indications this should be one of the greatest offerings of Poland Chinas ever offered at auction in California, featuring The Callfornian and The Westerner. The Westerner is growing rapidly and has over a ten inch bone at present.

Fortuna Bob is a line bred Big Bob yearling boar at the W. H. Rough Poland China headquarters at Arlington. He is a big fellow with plenty of finish, and very active on foot. He should "nick" well with the Superba blood in the herd. The big boar Supremis has shown his ability to "nick" with the blood of Big Bone, A Wonder, Blue Valley Golddust and Big Long Jumbo. Greenfield's Big Sis 30th is a 750 pound sow carrying litter by Supremis.

Mammoth Queen is the big yearling sow in the Renwick herd of Poland Chinas at Santa Barbara, bred by E. D. Frazier of Missouri. This fine brood sow has just farrowed 12 pigs by El Profito. A gilt of her September litter has just now been sold for $125.

The Elliott-Brant Rancho, Owensmouth, will have an aged show herd in the Duroc section at the fall fairs that will attract attention to the south end of the state. The big boar May Rose King will head a herd of big smooth line-bred Orion Cherry King sows.

The Union Commission Company, Santa Barbara, finds it profitable to keep a foundation herd of big-type Poland Chinas for their feeding operations on ranch at Santa Margarita.

MAKE CONSTANT USE OF

ECONOMY STOCK POWDER

FOR YOUR

Hogs---Cattle---Sheep---Horses

And You Will Have Healthy Stock

Economy Stock Powder

contains only the purest Poke Root, Sulphur, Blood Root and other ingredients which act upon the Kidneys, Liver, Spleen and Blood. It sweetens the contents of the stomach and bowels and removes all impurities from the system.

OTHER ADVANTAGES

Economy acts on affected parts,
Economy expels worms,
Economy aids digestion,
Economy suppresses a feverish stomach,
Economy cools the blood,
Economy lossens the bowels,
Economy aids nutrition,
Economy maintains normal health,
Economy is a perfect conditioner.

DON'T BE WITHOUT ECONOMY STOCK POWDER IF YOU WANT TO REALIZE THE GREATEST PROFIT FROM YOUR STOCK.

Use Economy Blocks

Economy Stock Powder is also put up in 6½ lb., and 50 lb. blocks. These blocks are specially prepared and adapted to range feeding. They are proving a big success.

Use Economy Germicide Dip

Disease germs vanish before this powerful and effective dip. Use it in the hog pens, the cattle yards, the corrals. Dip your stock regularly and you will keep them in a healthy condition.

Economy Germicide Dip is made of the best ingredients, scientifically prepared. It comes in five gallon cans, 15, 30 and 50 gallon drums.

One trial will convince you that this dip is the most effective eradicator of parasites you have ever used.

Give the world the once over

LISTEN, fellows, to some straight talk. Many a man when he gets to be 40, *misses something*. He may have lots of money, and a fine family but—

He never "got out and saw things". After he gets settled down, *it's too late*.

Every man wants to see the world. No man likes to stand still all his life. The best time to TRAVEL is when you're young and lively—right NOW!

Right NOW your Uncle Sam is calling, "Shove off!" He wants men for his Navy. He's inviting *you!* It's the biggest chance you'll ever get to give the world the once over!

The Navy goes all over the world—sails the Seven Seas—squints at the six continents—*that's its business.* You stand to see more odd sights, wonderful scenery and strange people than you ever dreamed of.

You'll work hard while you work. You'll play hard while you play. You'll earn and learn. You'll get, in addition to "shore-leave", a 30-day straight vacation—which is more than the average bank president can count on.

You can join for two years. When you get through you'll be physically and mentally "tuned up" for the rest of your life. You'll be ready through and through for SUCCESS.

There's a Recruiting Station right near you. If you don't know where it is, your Postmaster will be glad to tell you.

Shove off!-Join the U.S.Navy

When Writing Advertisers Mention California Cultivator

Turkey Problem From a New Angle

By Jean A. Koethen

OUT against the hills that surround the fertile Hemet Valley lives a man who believes he has solved the chief problems of turkey raising. With a thousand acre range back of him, the warm California sun overhead, dry, sandy soil underfoot, and no fog and little rain to hinder the growth of his young birds, he has certainly chosen their environment well, and this favorable environment is no doubt a potent factor in his success.

The man referred to is C. T. Johnston, who has been raising turkeys for many years in various parts of California and who has studied deeply into the causes of the untimely death of so many young birds. Mr. Johnston says the advice he gives to turkey raisers is not effective within 15 miles of the Pacific Ocean. The fog and chilly wind of the coast, he believes, are death to poults. To my mind he should have made his limit 25 miles instead of 15, but the distance probably depends on the geography of the district. A sheltered valley near the coast might be better than an exposed hillside farther away, except in a very foggy season. The point is simply the one so often made, that dampness is fatal to poults, and dampness means fog as well as rain.

Dinner Time

The boxes ranged along the fences are the nests. Along the hills beyond is the 1,000 acre turkey range.

Inbreeding Is Fatal

Mr. Johnston is satisfied that the underlying cause of the weakness of young turkeys is inbreeding, therefore he is introducing into his flock blood from wild turkeys secured from the mountains of Mexico.

No Turkey Mothers

Mr. Johnston prefers chicken hens for mothers. Part of the young turkeys are hatched by hens and part in incubators; part are reared by hens and part in brooders, but the turkey hens are kept laying as long as they will lay, and their maternal duties turned over to cheaper mothers.

When turkey eggs are hatched in the incubator the temperature is run at 102 the first week, 103 the second and third weeks and 104 the last five days before the hatch begins, beginning the 20th day. No moisture is used except what the incubator provides.

When chicken hens are used as hatchers they are set in the brood houses in which they are to raise their broods. These brood houses are 12 by 14, with a two foot alley through the middle and four compartments on each side. Four hens are set in each compartment, one in each corner. The nest box in each case is a triangle about ten inches high with the two rectangular sides connected by a diagonal slat. This is pushed into the corner of the compartment, which forms the other two sides of the box. The bottom of the box is covered with moist dirt, and the dirt with straw. As the only ventilation in the brood house is through burlap, the moisture in the dirt lasts through the four weeks of incubation and is all that is required.

When the hatch comes off all the poults are given to two mothers, and two of the partitions are removed. This gives each hen room for her brood, which numbers from 12 to 20, according to the weather. The little door opening out of the compartment is opened and a long, narrow run, four feet wide, 16 feet long and two feet high, is fastened over it. All these runs are portable and are moved from house to house as they are needed. When the poults are ready to roost, roosts are put in the houses above the low partitions.

Wild Turkeys

The hen in the center is a wild turkey. Notice the combination house in the background.

Feeding the Poults

The stage is now set for the real business of the season, the raising of the young stock. The poults remain quietly under the hen for from 24 to 36 hours before they receive their first meal. The first five days hen and poults are fed together so that she may teach them to eat. After this they are fed separately, the poults outside and the hen inside, for a hen cannot provide her brood with the requisite warmth unless she is well fed.

The first meal of the baby turkey and its whole ration outside of green feed the first two weeks consists of johnnycake thoroughly baked and crumbled fine before feeding. A handful is sprinkled over the little flat tray and the poults are allowed to eat all they will in ten minutes. The meal is repeated four times a day the first two weeks, the only change being that at the third meal each day chopped onion is mixed with the johnnycake. This meal consists of two-thirds onion and one-third johnnycake.

A scant handful of johnnycake is sufficient for 12 poults at first, but the amount is gradually increased till a two weeks it is probably twice as much. The amount, however, is gauged rather by the time the birds eat than by the exact quantity placed in the tray. At the end of ten minutes whatever remains is removed.

When the poults are about two weeks old they are gradually worked onto two meals a day of chick feed, which is given the first thing in the morning and at 2 o'clock in the afternoon. The other two meals, at 11 o'clock and 5, are johnnycake as before.

Toward the end of the fourth week another change is made. The ration of johnnycake is diminished and a mixture of kafir and whole barley substituted. The amount of whole grain is increased and the amount of chick grain diminished till by the end of three months the birds are on whole grain entirely. Now, as at the beginning, the meal lasts ten minutes.

No Sour Milk

In three respects the feeding is different. First, he feeds no sour or clabbered milk; second, he does not believe in feeding an unlimited amount of green. From the start the poults get onion mixed with their johnnycake at one meal a day. For eight weeks they are kept in the wire runs and not allowed to range. Then the runs are removed and they are given the run of the acre lot in which the brood houses stand. Not until they are past ten weeks are they allowed complete liberty. This means that they receive a comparatively small amount of green for the first eight weeks. His theory is that it is quite possible for poults to eat so much green that they are unable to eat the more substantial food necessary to their growth. Third, he thinks it is just as easy to underfeed as to overfeed. Many of the untimely deaths of little turkeys, he believes, are due to the fact that they have been so underfed that they have not sufficient strength to withstand the slightest attack of indigestion.

Chilled in the Morning

Mr. Johnston's experience has satisfied him that many of the deaths of poults the first three weeks are due to chilling in the early morning. The mother hen, whether she is a turkey or a chicken, is an early riser, and just in the chill of the morning when the poults need hovering most, she is apt to uncover them and leave them to keep warm as they may. Chicks can bear this heroic treatment, but poults cannot. This is one reason why it is so difficult to raise poults near the coast in May. The mornings are always foggy, and the hens eager to be scratching.

Because of this propensity of hens to be up and off, Mr. Johnston prefers raising poults in a brooder, which is always ready to warm them. Two 200 chick outdoor brooders are in constant use and losses among the brooder poults are far fewer than among those brooded by hens. As long as the mornings are warm the hen does good work. Let a frosty morning come, or the wind sweep down from the top of old San Jacinto, and the hen brooded poults are sure to suffer. The brooder poults are given heat as long as they seem to need it, which is usually about four weeks. Each brooder is supplied with its own little yard, about a foot high, and the poults are kept inside till they are ready for range.

Lime for Poults

The value of lime as a preventive of turkey diseases has long been recognized, but it is not always fed so easily as here. Once a week the trays in which the poults are fed are given a good thick coat of whitewash. The birds do the rest, and by the end of the week nearly all the whitewash is pecked off and the trays are ready for a fresh coat.

As 200 hens are needed for hatching, a combination turkey and hen house has been devised which shelters all the adult birds. One side consists of a high shed for the protection of the breeding turkeys in wet weather. On the other side is a lower shed for the hens and above it a sort of balcony, with room for a good sweep of air between roof and walls, where the turkeys roost. Along one side of the turkey shed are coops for the broodies. The nests are outside along the fence. During the breeding season the flock is not permitted to range, but later in the summer and fall they spend most of their time on the hillsides.

The breeders are fed a ration consisting of whole grain and mash, the mash being fed at night with a feeding of milo in the morning and of barley at night. The mash consists of ground milo, ground barley and bran or middlings, with about 12½ per cent beef scrap added. When they are on range they receive only a very light feeding of grain morning and night.

The Lyon Hatchery at Gardena made shipments of 5,000 day old chicks on April 8, 2,700 going to El Paso, Texas.

The hens do not belong in all the garden, nor all the garden in the hens.

INVESTMENT

—not expense

That's what Lactein Condensed Buttermilk is to the big, successful poultry raisers — they know that Lactein saves that 50 per cent of chicks that die the first three weeks of their life — they know how Lactein builds healthy, husky chicks — they know how it gives them the right start and develops the chick into a profit producing machine.

LACTEIN

Condensed Buttermilk

is pure, clean buttermilk pasteurized and processed, with the LACTIC ACID developed to the highest degree of efficiency—it furnishes the delicate chick's system with all the needed elements of tonic and food—keeps its system thoroughly cleansed—rids the chick of bowel trouble—wards off disease—and is a preventive of White Diarrhoea.

LACTEIN Condensed BUTTERMILK is the investment of Chick and Poultry food that turns loss into profit. It is a proven food and tonic—used by the largest poultry raisers in the world.

GET MORE EGGS.

"Lady Victory"

1918 Champion laid 304 eggs in 365 days. Highest official record of any living hen. She laid 25 eggs in Jan., 27 in Feb., 29 in March.

***Milkoline* will help make your hens lay more eggs.**

Feeding Milkoline will make you more money —reduce mortality of your flock— keep flock healthy and less liable to disease.

Increase Poultry Profits Any poultry raiser can easily double his profits by doubling his egg production. Feeding **Milkoline** with other feed greatly assists assimilation, keeps digestive organs vigorous and is a wonderful appetizer, tonic and bowel regulator. **Milkoline** contains nutritive elements vital to egg production and not found in grain rations.

13,000 More Eggs

Jas. E. Keyes, Petaluma, Calif., says: "After feeding **Milkoline** for eighteen months to 2,500 hens, I find that worms cannot exist in poultry where **Milkoline** is used. I reduced mortality with laying hens 10 per cent. I increased the egg production of my flock **thirteen thousand eggs** in one year. Feeding **Milkoline** to laying hens keeps them in splendid health thereby preventing disease and derangements of all kinds."

Milkoline

has a base of modified buttermilk with essential fats and acids added. **Milkoline** comes in condensed form. Will not mould, rot or sour. Keeps indefinitely in any climate. **Milkoline** is simply **"Good Buttermilk Made Better for Feeding."** Flies don't bother it.

Lowers Feeding Cost

Many feeders say **Milkoline** lowers feeding cost one-third, because their hens assimilate all feed they eat. Our liberal **Guaranteed 30 Day Trial Offer** enables you to try **Milkoline** at our risk—to prove that it will make you mighty good money.

Prevents Disease

Milkoline is not featured as a cure for anything or a preventative, but due to the acidity in the buttermilk it is a germ destroyer and helps keep poultry healthy, which is the best preventative against disease. **Milkoline** is invaluable as a life saver for baby chicks.

PRICES

These prices are F.O.B. Kansas City or the address of our nearest dealer. Dealers in all parts of the United States.

5 Gal. Keg	$7.50
10 Gal. Keg	12.50
15 Gal. Keg	16.50
32 Gal. Barrel	32.00
55 Gal. Barrel	49.50

Prices on smaller package given in booklet. Buy in barrel lots—it saves you money.

Only 2c a Gallon

For feeding mix one part of **Milkoline** to 60 parts of water (small feeding 5 tablespoons to gallon of water). Feed either with water or mash feed. **Milkoline** keeps their appetite keen and its action is highly essential to normal egg production. When fed as directed **Milkoline costs only 2c a gallon** or less. Trauhaft & Newman, Lankershim, Calif., say: "We would not go back feeding straight buttermilk at any price."

Guaranteed Trial Offer

Milkoline has been producing so many amazing results and we are so certain of what it will do for you that we will ship you 1 Gallon for $2.25, **express prepaid.** Take 30 days — feed half to your poultry. If not entirely satisfied simply return unused portion and we will refund every cent you paid us. No charge for portion you have used. **Milkoline** is legally guaranteed to be satisfactory. You are always the judge. We suggest ordering larger quantity — you get the benefit of lower price — you risk nothing — you must be satisfied or we refund every cent you paid us. **Make this test now.** The sooner you begin using **Milkoline** the quicker you will be making money.

Duroc Hogs and Shropshire Sheep. Pure bred stock for sale at all times. J. J. Prendergast, Redlands.

TOYON FARMS CONSIGNMENT TO THE NATIONAL GUARANTEE SALE

Two good Holsteins leave the state next June when Toyon Farm Association ship Moxee Johanna Korndyke Piebe and Princess Jonge Buckeye to the National Sale at St. Paul. Nothing but the best can make the long trip to this Eastern classic. These two cows certainly belong in this category.

Moxee Johanna Korndyke Piebe is a three year old daughter of Cascade Fleta Johanna, the 30,000 pound cow who recently completed her remarkable test period. Her sire is Sir Korndyke Ormsby Piebe, a grandson of Sir Pietertje Ormsby Mercedes. The get of this famous old sire have repeatedly topped the Eastern sales. This cow's breeding should make her a popular subject in the bidding and she should bring a good price. She is in calf to Sir Pietertje Ormsby Mercedes 43rd and her calf thus carries a double cross to Sir Pietertje Ormsby Mercedes.

Princess Jonge Buckeye is the second entry for the sale. She has just completed her third test period, making 1,050 pounds of butter from 27,906 pounds of milk. Her records have all been good, so she carries her own guarantee. Her sire is Prince Hengerveld Buckeye 2d, a grandson of Prince Hengerveld Pietje, sire of two three-times 30 pound cows. The dam Highlands Jonge Pride 2d is a 26 pound cow. Princess Jonge Buckeye is safe in calf to Sir Aaggie Mead, one of the best young bulls in the world.

SALE OF HOLSTEIN BULLS

The Stanislaus County Holstein Breeders are featuring a sale, probably the first of its kind on the coast, a sale of bulls, mostly young though ready for service. It is to be held at Modesto, Thursday, May 27. One of the most promising of these is a son of Sir Johanna De Kol Rag Apple; another is the son of a 30 pound bull, El Prado Wayne Colantha; another is a double grandson of the $50,000 King Segis Pontiac Alcartra. Other offerings are of great merit. Secretary E. M. Morrow of Modesto is mailing the catalogs.

PREVENT FIRES

"Help Prevent Forest Fires" is the slogan which will appear on all mail passing through Uncle Sam's post-offices at Sacramento, San Diego and Los Angeles.

"We hope, by the use of post office cancellation dies, as well as by other means, to bring home to the people of California their individual responsibility in the matter of forest fires," says District Forester Redington.

"Campers in the national forests of this state last year were responsible for over 30 per cent of our fires," he continued, "and yet those very campers are loudest in their denunciation of the annual destruction of our forests by fire. If they would only learn to be careful, to build a small fire and never to leave it until they had put it out with water and then covered it with earth, they could go back each year to their favorite camp grounds. As it is, many of the most beautiful of mountain camping spots are being destroyed by fire each year."

"Help Prevent Forest Fires" should be the first thought and the last of every mountain camper this year.

SALT THE FLEAS

A great many inquiries are reaching the bureau of entomology, United States department of agriculture, for methods of controlling fleas. The work of the department has shown, fortunately, that the best means of controlling fleas in most instances is very simple. Fleas usually originate in the basement of the house, or in some covered place such as woodsheds and stables, to which hogs, dogs, or other such animals have access. The remedy is to give the basement, shed, or other breeding place a thorough cleaning, burn the litter, and then sprinkle the floor or ground in the building or shed with common salt. The salt should be sprinkled thickly enough almost to cover the ground and should then be wet down with water, the specialists say. It should not be wet sufficiently to cause it to run, however. If there are about the place any houses, cribs, or the like built on piles so that hogs and other animals can go under them, salt should be applied there. Generally speaking, it is fairly easy to determine where the fleas originate, and it is usually such a place as can be reached by the salt treatment. It may be necessary to repeat the operation two or three times at about three day intervals.

CONTROL AMERICAN FOULBROOD

American foulbrood is a disease of the brood of bees which is causing great losses to American beekeepers. It has existed almost since bees were were first brought to North America.

It is important that the beekeeper should know whether American foulbrood or European foulbrood is in his apiary, for the two do not respond to the same treatment, according to Farmers' Bulletin 1084, "Control of American Foulbrood," recently issued by the United States department of agriculture.

In American foulbrood control it is necessary that all combs, honey and other materials from the inside of the hive be taken from the bees and that a chance be given them to establish themselves again on new combs. Several methods are given in this bulletin, but the underlying principle is the same in all cases.

No measures which the beekeeper may take will put his bees in such condition that they will not contract this disease, but by guarding them from infection he may save himself much worry and financial loss.

The facts about the disease on which the treatment is based are discussed in this bulletin and the treatment is described in full. The bulletin will be sent free on request.

RASTUS UP TO DATE

Rastus: "Ah've named ma old cow United States."

Sam: "Whaffo do you did dat?"

Rastus: "She done gone dry."

SOME "HA'NTS"

Sweet She: "Some of these old songs haunt me."

Sour He: "Is it because you murdered them so long ago?"

CLEMENCEAU

By James J. Montague

At fifty-two or fifty-three,
When your old dad and mine
Contentedly sat down to watch
Their suns (not sons) decline.
A gentleman named Clemenceau,
Who dwelt somewhere in France,
Was saying, "In a year or so
Perhaps I'll get my chance!"

At sixty-two, or thereabout,
When, reader, you and I
Without a shadow of a douht
Will feel not quite so spry,
This husky, time-defying chap,
As lively as a pup,
With all his intellect on tap,
Was making France sit up.

At seventy (when we'll be glad
(If we are still around),
This indestructible old lad
Was hale and hard and sound.
At seventy-six, still going good,
The same old thoroughbred
Again got on the job and stood
The kaiser on his head.

And now, arrived at seventy-eight,
He sighs in calm content
When beckoned by the hand of fate
To run for president.
Here's to that lusty heart and brain!
Long may they live and thrive.
Who knows what heights they may attain
When he is ninety-five?

MORE BEAN RECIPES

Bean Soup

1 pint small or large white beans, 1 quart of milk, 1 small onion, 4 tablespoons chopped parsley, butter size of hens' egg.

Beans should be soaked over night and boiled until the skins slip, adding a piece of salt pork when cooking. Rub through a sieve. Fry the onion slowly in butter. Heat the milk in double boiler. Put in butter and onion; add the strained beans, salt and pepper. Let stand, keeping them hot, for two hours. When serving add chopped parsley, stir in and serve at once. This will serve four persons.

Using this same foundation, add half as much strained, well cooked potatoes, a few carrots, and the result is Potage Nirermaise.

Buttered Beans

1 pound large white or kidney beans, 1 tablespoon salt, 5 tablespoons butter, ½ teaspoon pepper.

Wash the beans, cover with water and let them stand over night. It will then be comparatively easy to press the beans out of their cellulous casings. Then cover the beans with a quart of water, bring slowly to a boil, drain, rinse with cold water, again cover with water and simmer for about one and one-half hours. Be careful that the mixture does not burn. Watch constantly and stir often, especially during the last half hour. Add more water as needed during the cooking. When the simmering is finished, put the beans in a baking dish, season with salt, pepper and all but one tablespoon of the butter, adding just water enough to make them the consistency of very thin mashed potatoes. Bake for an hour in a slow oven. Twenty minutes before taking them out dot the remainder of the butter over the top. Serve hot or cold.

Jellied Beans

1 cup cold beans, 2 tablespoons gelatine, salt and paprika, 1 bay leaf, 1 pint tomato juice, 1/3 cup cold water, 1 tablespoon minced onion.

Make a plain tomato jelly by dissolving gelatine in cold water and pouring over this the hot tomato juice in which the seasoning ingredients have been cooked. Add to this mixture one cup cold boiled beans. Pour mixture into molds and allow them to chill. Serve with boiled or oil dressing.

Bean Muffins

2 eggs well beaten, 1 cup cold boiled bean pulp, ½ cup milk, 1/3 cup melted fat, 1 teaspoon salt, 2 cups flour, 2 teaspoons baking powder.

Combine above in order given. Bake muffins in greased muffin pan for 20 or 25 minutes.

Tomato Sauce for Bean Loaf

Stew tomatoes, strain and put the juice down to boil with a little of the mixture; add salt and paprika; thicken to consistency of drawn butter with a little flour.

AN IDEAL LIVING ROOM

A room in which we can spend happy, restful and inspiring hours. It is built on a generous plan with wide casement windows to bring in air and light, and straight hanging draperies drawn back to frame vistas of garden and orchard. The big tapestry covered Davenport welcomes to its comforting arms one or two or three—or maybe four—of the family or makes a comfy coach for tired Dad while Mother reads or sews in the low arm chair opposite. The reading lamp, the table with its books and flowers, the bookshelves beyond unite in creating a homey and beautiful corner.

Pieces of furniture like these are built to last a lifetime and more and only grow handsomer and better as the years go by. They are an investment which brings big returns in comfort and satisfaction as well as in actual financial saving.

THIS WEEK'S PATTERNS

The Cultivator is glad to give this week pattern of a corset cover which has been often requested. 2905 shows a cover with inconspicuous shoulder straps and cut wide and low under the arms to give the maximum protection and comfort. A hint as to the shoulder straps. If these are made of footing or of a good quality of net insertion, they will effectively conceal brassiere or vest strap underneath and render all practically unnoticeable. Straps of vest and brassiere may also well be replaced by similar insertion for wearing under sheer waists and summer dresses. Be sure to send size, name and address when ordering.

The summer gown 3231-3218 carries suggestion of old time rose gardens and shady porches and dainty slippered leisure. Be sure to note the dress requires two patterns, one for waist, one for skirt, each costing ten cents, 20 cents for both. Many of our patrons fail to get their patterns on time because they fail to note that two patterns make up some of the costumes and send only ten cents to pay for one. Be sure to read description of sizes and prices under each pattern number.

The Cultivator Patterns

BE SURE TO SEND SIZE

3230. Ladies Dress—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inchee bust measure. A 38 inch size will require 5¼ yards of 36 inch material. The width of the skirt at lower edge is 1⅝ yard. Price 10 cents.

Address

PATTERN DEPARTMENT
California Cultivator
Los Angeles

3230 looks as if it had just come from a specialty shop which tags amazingly big prices on perfectly simple looking gowns because they have the air of being just right and "exclusive." Simple as it is it has the great charm of perfect design in every detail. A bit of hand embroidery in your own pet color and design will make it distinctive.

The three beautiful new sleeves 3224 are included in the same pattern for ten cents and afford opportunity for changing last year's gowns. No. 1 has an insert, No, 3 a flaring end added, and No. 2 is cut short, so that all are helps to the "make-over" dressmaker.

HOUSEHOLD QUERIES

Spanish Herbs

We have had so many inquiries for address of dealer who can supply Spanish herds, used in recipe for pink beans given by Mrs. Torbert in the Cultivator of April 10, that we have been investigating and find that the names of the Spanish herbs used are oregano, a dried leaf of a plant of the lippia family, and comino (cumin). These may be purchased separately and combined according to taste. Mrs. Torbert recommends using a little more of the leafy herb (oregano) than of the seed (comino). For convenience of inquirers we repeat Mrs. Torbert's recipe for preparing pink beans:

One quart beans (dry), cook till half done or more; one large onion, one red pepper, one slice bacon, one-half cup salad oil or olive oil, pinch of black pepper, salt, one-half can tomatoes, one large pinch Spanish herbs (use a little more of the leafy herb than of the seed). Tie these two herbs together in cloth and add everything named except salt when beans are beginning to soften. Salt when about done.

We have on file in this office addresses of a firm in Stockton which carries the Spanish herbs and of two in Los Angeles, and if readers do not find them in their own locality we will be glad to send by letter on receipt of request.

Drying and Candying Figs

Please tell me how to dry figs, the kind we see in boxes with nuts on top. Are the black and white figs dried the same way? — Subscriber, Tracy.

Directions for drying figs are given on Page 854 of this issue. The black and white figs may be handled in the same way and are equally good. These are placed in the fancy gift boxes displayed in grocery and confectionery stores with a half nut meat pressed on top. Or, thinking possibly our subscriber may refer to candied figs, we give here directions for preparing in this way. These directions also answer for candying other fruits:

Use ripe, firm figs; puncture in several places with wooden toothpick. After preparing as above, the fruit is cooked gently from three to five minutes. Too much cooking will spoil the shape and texture. Too little will result in slow penetration of the sugar, dark color and toughness.

Make a syrup of 25 degrees Balling, about one part sugar to three of water. Heat syrup to boiling and pour over the cooked fruit placed in an earthenware pot while still hot. A Balling saccharometer is convenient when working on a large scale, but is not necessary for small quantities. Half the sugar in this first syrup may be replaced with Karo or other liquid glucose. This prevents the hardening of the finished fruit by crystallization and makes it more translucent.

Keep submerged in syrup. Remove the syrup every 24 hours, increase five degrees Balling by the addition of about one-quarter the amount of sugar used originally, boil, and pour back on the fruit. When the syrup reads 68 degrees Balling (as thick as honey) it is dense enough.

Leave in the last thick syrup until it has penetrated the fruit (three or four days) and then place on a wire screen to drain a few days until the outside of the fruit ceases to be sticky. The fruit will drain more quickly if placed in the sun or other warm place.

The finished fruit may be packed in candy or cardboard boxes lined with paraffin paper or in open jars. In airtight containers they may mold; some ventilation is necessary.

Those who want plans and ideas for making their homes more beautiful and comfortable, will enjoy every one of these FREE BOOKS.

The Coupon below—clipped and filled in and mailed to Barker Bros. will bring them to any home lover with our compliments.

Four walls make a house—but—it requires Furniture to make a Home, and well chosen Furniture to make a successful home.

A successful home is well planned—every item of Furniture is thought over and discussed by all the family. It grows in beauty and comfort because of wise planning. Its charm is maintained by constant attention.

To plan wisely is not always easy particularly for those who are far removed from easy access to big city stores. Barker Bros. for years have been helping home lovers by issuing Booklets, Magazines and Catalogs about the things that make home comfortable and more successful.

They Are FREE---The Coupon Below Will Bring Them

1918 No. 1 price was 28; fancy budded, 31½.

HAY

Alfalfa Growers of California, under date of May 19, say: Receipts of alfalfa hay this week still show no material increase. They are remarkably light for this time of year, especially as far as better grades are concerned, the arrivals of which are not sufficient to even satisfy the current demand, let alone stocking up for future use. Prices remain correspondingly firm.

As the season advances, it is becoming more and more evident that important changes in the line up of production and distribution of alfalfa hay in the state have taken place this year, which are apt to effect materially the supply available for shipment to the central consuming markets.

These factors are, principally the net decrease in acreage in favor of other crops, the shortage of water for irrigation purposes, change from producing hay for marketing to its use for dairying, and generally light yield in other sections so far this season. The result is that the first cutting usually more or less of a drug on the market on account of its inferior quality, has in almost every section been eagerly picked up by the consumer in the same districts it was raised, at prices ranging far above Los Angeles market, so a very small percentage of the first cutting remains unsold. The question thereupon is whether the remaining cuttings from this reduced acreage and a probably lighter yield will furnish sufficient hay to satisfy local demands, and also the shipping demand and what effect this situation will have on prices.

The situation is complicated by the fact that the states which usually make up a shortage in California by shipping into this state, seem to be worse off that we this year. The alfalfa growers in these states—Nevada, Idaho, Oregon and Utah—are all expecting to be short this year. The principal marketing acreage of Nevada figures on only one cutting this year on account of water shortage. Oregon is in the market, and is making bids at present in Northern California for alfalfa hay. One of them from a Portland concern, was $27.00 per ton, f. o. b. shipping point for Foxtail first cutting hay. A shortage in California and also in those other states would, of course, make a serious situation all around and its effect on prices can easily be conjectured.

San Francisco buyers have recently been making offers for second cuttings around $30 per ton, f. o. b. shipping point.

The Eastern market for feeding stuffs of all kinds remains extremely firm. No. 1 timothy hay sold this week in Chicago at $50 per ton; standard timothy at $48 per ton. Bran in Minneapolis (the principal producing market of this commodity) sold at $60 per ton. All of these are unheard of prices.

Southern California conditions are improving daily. In regard to the condition of hay received, the demand, and price:

Choice Alfalfa, 38.00 per ton.
No. 1 Dairy Alfalfa, 34.00 per ton.
Standard Dairy, 30.00 per ton.
Stock Alfalfa, 27.50 per ton.

GRAIN AND FEEDS

Layers: 6-crown, flat pack, 20s, per box, 4.05; 6-crown, flat, 10s, per box, 2.20; 6-crown flat pack, 5s, per box, 1.20; 4-crown, flat pack, 20s, per box, 3.20; 4-crown, flat pack, 10s, per box, 1.75; 4-crown, flat pack, 5s, per box, 1.00; 3-crown tray pack, 20s, per box, 3.10; 3-crown, flat pack, 20s, per box, $2.95; 3-crown, flat pack, 10s, per box, 1.60; 3-crown, flat pack, 5s, per box, 95; clusters, 20-1s, cartons, 3.45; clusters, 12-2s, cartons, 3.80; clusters, 4-5s, cartons, 4.50; vineyard run, 100s, 13.00.

RICE

The domestic market is unchanged. Mills are receiving very little paddy, due to the railroad strike. Spot stocks are somewhat depleted. Fancy California Japan, prompt, is quoted at 10.75, June at 10.85, July at 11.00 and choice 25 cents less.

BEANS

Jobbing prices at San Francisco, per cental: Small white, 5.75@6.00; large white, 6.20@6.35; cranberry, 6.00@6.50; red Mexican, 8.50@8.75; pink, 6.40@6.50; California Bayo, 9.50@9.75; blackeye, 7.25@7.50; red kidney, 13.00@13.25; lima, 10.25@10.50; Garvanza, 9.00@9.50; Kotenashis (in bond), old crop, 5.25; new crop, 5.75.

Dried Peas: California, 5.25@5.50 cental.

HOPS

1919 crop, 1.00 per lb. Prices to growers for 1920 crop, 80 per lb.

LEE-KOE REG

TEA, COFFEE & BEVERAGE CO.

316 West Fifth Street, Los Angeles, Cal.

HONEY

Demand and movement good, supplies light. Prices, cash to producers: light amber alfalfa, 14@15. Beeswax—demand and movement moderate, at 39@40.

GRAIN

Wheat: The prices are based upon Federal grades and standards at the terminals in San Francisco bay and Los Angeles and are as follows per bushel of 60 pounds:

Hard White—	Per Bus.	Per Cen
No. 1	$2.20	$3.63 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.13	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51½
Club and Sonora—		
No. 1	$2.16	$3.60
No. 2	2.13	3.58
No. 3	2.00	3.48 1-3

The above are minimum prices.

For sacked grain add 4½ cents per bushel to the above prices. Deduction of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.

Oats: Red feed, 3.15@3.30.

Corn: California yellow, 3.50@3.65 per cental; Egyptian white, 3.80@4.00; milo maize, 3.35@3.45.

Barley: No. 1 feed, 3.30@3.40.

HAY

Under date of May 15 Scott-Magner says:

Receipts past week 708 tons. Even this small tonnage is not delivered as it arrives because of difficulties in switching. These crippled conditions have upset the hay business badly and prices quoted can only be considered nominal because the trading is so light and the interruption in service so serious that extra prices are paid when goods are obtainable and are really no indication of any stable market conditions here. Practically nothing has come in from outside states and the bulk of receipts is of the clean-ups in lots of old hay and the beginning of the new alfalfa. It is yet too early to form opinion as to the quantity or volume of the new hay crop although many wild guesses are being made at the present time. It has been many years since conditions such as exist have been known in San Francisco or in the state hay market. Dealers and consumers are, therefore, naturally backward in setting figures for trading or in making any substantial offer. Buyers are paying what prices are asked at the present time to supply their immediate need but none are prepared to purchase in any quantity at anywhere near the present range of prices. We quote today wholesale prices in carload lots (old crop) as appear from dealers' transfers upon the hay market in San Francisco) for prices to consumers charges of cartage, commission and handling expenses must be made according to conditions):

Fancy wheat hay (light 5 wire bales)	38.00@41.00
No. 1 Wheat and Wheat and Oat hay	35.00@38.00
No. 2 Wheat and Wheat and Oat hay	32.00@35.00
Choice Tame Oat hay	37.00@40.00
Wild Oat hay	Nominal
Other Tame Oat hay	33.00@37.00
Barley hay	Nominal
Alfalfa hay new	Nominal
Alfalfa hay, old	30.00@32.00
Stock hay	29.00@32.00
Oregon Cheat and Oat hay	29.00@32.00
No. 1 Barley straw, bale	70@1.00

Citrus Markets

Los Angeles, May 19, 1920.

Orange shippers are getting a fairly satisfactory supply of cars and have been able to send heavy shipments of oranges to Eastern markets which are now paying good prices. New York especially has been absorbing heavy receipts of Navels. Best quality fruit has been running over six dollars. A very satisfactory market is developing on Valencias, prices running from 3.50 to well over 6.00 for top quality.

Lemons: In spite of large receipts of foreigns the lemon market is holding up satisfactorily. Reports are that there are now on dock and afloat 275,000 boxes of foreigns.

Shipments

Shipments of oranges to date from Southern California since November 1, 1919: Oranges, 18,481 cars; lemons, 3,754; total, 22,235. To same date last season: Oranges, 20,957; lemons, 5,126; total, 26,083. From Central California to date this season: Oranges, 5,147; lemons, 287; total, 5,434. To same date, last season; Oranges, 3,007; lemons, 251; total, 3,258. Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

HIGH LIGHTS ON HOLSTEIN SALES

(Continued from Page 858.)

a very choice selection of females and topped it off with one of the greatest bargains in the way of a young bull that has gone through a sale this year. This youngster, King Netherland Skylark Mead, is a son of King Mead of Riverside, out of a 27 pound dam with close to 600 pounds butter in one year as a two year old, second dam a 28 pound cow with 780 pounds butter in one year as a four year old.

W. J. Higdon, Tulare, appeared as a buyer of tops in the Leeman & Kilgore dispersal. He secured two daughters of King Mead of Riverside, a two year old and a yearling, at $1,350 and $1,100 respectively, also two good daughters of Segis Pontiac De Kol Burke.

E. Peterposten, Hughson, was busy early in the Leeman & Kilgore dispersal and made a number of corking good buys before the sale had progressed to the higher prices.

Burr Farm, Los Angeles, has without question been the star buyer of top stuff this spring, starting off with 20 head in the Guaranty Sale at an average of over $700. This was followed through the succeeding sales by unusually careful selections among the higher levels, and brought to a climax with the purchase of King Korndyke Pontiac 20th at the record price of $12,000 in the W. J. Higdon sale. With the outstanding herd of females now on Burr Farm, headed by two such bulls as King Korndyke Pontiac 20th and Sir Veeman Korndyke Pontiac, this establishment takes its place among the leading American breeding plants, and the broad gauge policies shaping the development of this herd are destined to carry it far toward the top of Holstein breeding achievement.

ASSOCIATION TO SEND REPRESENTATIVE TO CALEDONIA SHORTHORN SALE

Edward Cebrian, manager of the Caledonia Farms, West Sacramento, has received word from Frank W. Harding, secretary of the American Shorthorn Breeders Association, that the association expects to send a representative to the Caledonia sale to be held next week. The representative will be glad to advise with breeders and to assist new men in the selection of foundation material from the 70 head of cows that will be sold. Few sales have attracted more interest than is developing over the coming event, much of the interest being due to the fact that nearly all of the offering carries the service of one or another of the famous Caledonia herd bulls, Imp. Caledonia, Gainford Matchless and Pine Grove King. This sale will afford the first opportunity for Western breeders to secure the blood of the first two bulls, and owing to the high esteem in which they are held it is probable that breeders throughout the West will be present.

The development of the registered Shorthorn industry in California has been very active during the past two years and during the last year more valuable bulls have been introduced into California herds than ever before. Heretofore it has been necessary for the leading breeders to go to Eastern herds when in need of herd bulls, but from now forward, with such bulls as are owned by the Caledonia Farms available, the annual pilgrimage East will not be necessary.

The coming sale will be one of the largest ever held in the West, 70 head of cows having been catalogued and at least 35 will sell with calves at foot. Most of the cows are daughters of well known sires.

The sale will be managed by C. L. Hughes of the California Breeders Sales and Pedigree Company and Col Ben A. Rhoades of Los Angeles will be the auctioneer.

COULDN'T BE OTHERWISE

Grouch: "This coffee is like mud."

Waiter: "Sorry, sir. It was just ground before the water was put on it."

DAIRY AUCTION

OAKWOOD STOCK FARM

Known as the Old Johnson Place

Four miles west and two miles north of Manteca

Thursday, May 27th

224 Head Cows, Heifers and Calves

Mostly all Holsteins

All this stock sired by bulls with reputations.

There are in this herd 135 heifers, from four months to three years old; about 50 heavy with calf and a number that are springers. 54 milk cows, 45 fresh in two months; 35 calves, a few fine bull calves; two fine work mares six years old, weight over fifteen hundred pounds each. Five unbroken colts.

The owner has the reputation for having everything of the best. All will be sold. Stock in fine condition. Sale rain or shine. Free lunch.

J. Flack, Cashier — John S. Ladd, Clerk

Frank Reichmuth, Owner

Gall, Helper and Gall, Auctioneers

For further information, see Gall & Gall, 333 East Market St., Stockton, Calif., or telephone Jack Helper, Manteca, Calif.

DISPERSAL

50 Young Registered Holsteins

30 Heifers — 20 Bulls

State Fair Grounds, Sacramento

Saturday, May 29

This is a complete dispersal of the remaining stock owned by Henderson Company, all young things under milking age.

THE HEIFERS are mostly granddaughters of King of the Pontiacs, being sired by King Pontiac Segis Inka. They are a beautiful lot and many have high record dams.

THE BULLS are mostly sons of King of the Black and Whites, out of choice dams, and they are a most attractive lot of youngsters.

Arden Dairy, El Monte, California.

For Sale—One No. 16 Ross Ensilage Cutter, on truck. 36 feet of pipe. Used one filling.
Arden Dairy, El Monte, California.

What's going on inside?

THE mysterious process by which feed is converted into eggs—and eggs *into money*—is no mystery at all to the poultryman who uses SURELAY. You know that nature provides each laying hen with just so many eggs in embryo. After that it's up to the hen—and to you!

If you let Mrs. Hen follow her own lazy inclination in the matter, she may take six or seven years to produce her quota of eggs. Not much profit in that—is there? So, its up to you to see that she produces her full supply of eggs in *two or three years.*

That's why she must be *fed into action.* But, the elements of an egg are derived from so many sources that no single food will answer the purpose. Hence the need of a uniform, balanced feed like SURELAY. For, it contains at least a dozen ingredients blended and mixed more skillfully than can possibly be done by hand. It is made so good, so tasty, that every time Mrs. Hen takes a peck of SURELAY she is eating a little of everything that goes to make up an egg.

The poultryman who consistently uses SURELAY never has to worry about what's going on inside. He knows that all's well with the hen because all's well with the feed. SURELAY contains no harmful stimulants, no questionable "scraps," no adulterated substances. It is a clean, prime feed that has stood the test of time.

And SURELAY is always the same—always uniform! Our daily laboratory tests make sure of that! No guess-work! You know that "what's on the sack is in the sack—and that's what makes the eggs."

If you want to get down into the vitals of this feeding question—if you want to see why SURELAY has won the favor of millions of hens and the faith of thousands of poultrymen—send for our booklet, "Makes Hens Happy." Simply cut out the coupon and mail today—it's free!

All Together, Please---"HELP PREVENT FIRE"

We do not know how great an interest David, the Psalmist, took in fire prevention in forest reserves in the Holy Land, but from the history of that once wonderfully rich land, its agricultural history, we mean, it appears that David might well have sung more songs which would have inspired greater protection of the sides of Lebanon and especially of the headwaters of the Jordan. However, it is possible that he realized to a faint degree the destruction which was being visited upon the land, for he sang: "My sorrow was stirred and my heart was hot within me and while I was musing the fire burned," and it continued to burn for many years after David passed. Three thousand years have not entirely corrected the situation which existed in David's time for today scenes such as depicted above cause serious meditation—perhaps not enough of fierce fighting of fires—and comment on the indifference of a lot of our fellow humans who should join in a campaign to prevent such scenes. Governor Stevens has appealed to us to devote much of the time during the present week to meditation on fire prevention. He says,

"Fire annually devastates large forest areas, lays waste many thousands of dollars worth of pasture, hay, grain and other crops, destroys rural, town and city improvements, thus adding greatly to the economic burden of the people of California."

Eleven states have joined California in observing this week as fire prevention week. Forest service, both state and national, fire prevention bureaus, chambers of commerce, clubs and farming bureaus are uniting and memorizing the slogan, "Help prevent fires."

California's Homiest Homes---What Makes Them

Cultivator Subscribers Tell What Makes a House a Home. Are We Doing and Living Our Best? If So, Some Old Home Influence of Childhood Days is Responsible

PRAYER FOR A LITTLE HOME

God send us a little home
To come back to when we roam.
Low walls, and fluted tiles,
Wide windows, a view for miles.
Red firelight and deep chairs—
Small white beds upstairs—
Great talks in little nooks,
Dim colors, rows of books,
One picture on each wall,
Not many things at all.
God send us a little ground,
Tall trees standing 'round,
Homely flowers in brown sod,
Overhead, thy stars, O God.
God bless, when winds blow,
Our home and all we know.
—L. L. in London Spectator.

"WHAT IS THE HOMIEST THING?"

By C. M. Bloom, Escondido

To me nothing in the house is so homey as the fireplace. It is a thing every member of the household enjoys, even the cat and dog. It is such a part of the home that in some languages it is the word commonly used for home, as "hogar" in the Spanish.

The home is for all, and the homiest thing is necessarily that which all members of the family enjoy. The library should be enjoyed by all; but is it? An easy chair may be furnished for father and mother; but does every member of the household have an easy chair? The piano should be enjoyed by all even when played by those who have very little knowledge of music; but it is a well known fact that there are people who suffer agony when listening to any kind of music. It may be they are not normal, but the house should be made homey even for the abnormal. And for those who are capable of enjoying the library or the piano it seems to me their enthusiasm must be considerably cooled on a winter's eve without a glowing fire in the fireplace.

What a joy it is to the tired farmer or the fagged merchant or the weary any other man or woman breadwinner to return in the evening to the home where the logs are piled in the fireplace and the fire is crackling.

And there is one other who visits the home. It is true he comes but once a year; but he must enjoy dropping in where it is made so easy for him. He comes very late. The little folks have vainly struggled to keep awake to welcome him, but about midnight when slumber envelops all and the fire is almost dead, the fireplace is still there and invites the visitor to enter, and as he drops down quietly and fills the row of stockings, even Santa Claus must think the fireplace is the homiest thing in the house.

"WHAT IS THE HOMIEST THING?"

Mrs. Leola T. Park, Riverside

Books are the most attractive feature in any home and add most to the pleasure of each individual person.

The "Old Arm Chair" in front of the open fireplace is a foretaste of that home that is perfect and complete, but with nothing to read it would lose its charm. Unconsciously when we enter a house the books and magazines are the distinguishing feature, and we estimate the life there through the authors that influence the daily life of the people.

My country home was made more attractive by a square piano, but it sinks into insignificance when I think of the hours spent with Dickens and Scott and Burns. Yes, and Mrs. D. E. N. Southworth and Mrs. Wetherel and others.

From Mother Goose to Macaulay's histories books wield the influence that is "homiest" and best. Their very presence is an inspiration, and nothing broadens and elevates individual character like daily contact with the best authors.

The chill of depression came over me a few days since when I entered a modern "up-to-date" bungalow and there was not a book in evidence. It was simply an expensive house where people stayed and gave no impression of the home life in "Cotter's Saturday Night," nor of the feeling that came when we entered an old fashioned domicile where well thumbed books were piled on the tables and window seats.

THE REAL HOME

By Edgar W. Cooley

Somewhere, before the dawn of civilization, a man and a woman sought a safe place for a little child. It may have been a cave, a crevice amid the rocks, a tangle of grass in a jungle, or a dark recess in the forest. It may have been furnished only with matted leaves or the skins of animals, but it was a place where the family could find comfort and companionship; a refuge in which the children could grow and develop —the one spot to which they laid absolute claim of ownership, over which the mother watched with tender care; for which the father fought and would have died. It was the world's first home.

During the millions of years since then, worlds have been destroyed, continents have disappeared, nations have been overthrown. But the home has survived.

Many millions of men, women and children inhabit the earth. The children outnumber the adults by the ratio of three to one, and the home and the school shape the destiny of boys and girls.

The real home is not simply a place to stay. It is a place the children will always remember; a place to which they will love to return, in which they will rejoice to live. Because it belongs to and is a part of the family, it is a real home.

The rented dwelling, the apartment house, the flat, can never be a true home. It can never center within itself the affections of a generation. It can never impart that stimulus which the pride of ownership inspires. More serious than all else, it cannot cultivate, to its fullest maturity, the love of the parents for their children.

The home is the institution for which and by which all other institutions exist. It was the birthplace of liberty. It is the shrine of patriotism and the abiding place of love and peace and true and lasting friendship.

OUR HOMIEST THING

By Mrs. Ella Williams, Fullerton

Our house had been built with an open upper porch. At first we had thought it a splendid idea to have a place to spend our warm summer afternoons, for it had been built on the east side of the house. We had also thought it an ideal place to take our cots and gaze at the stars and have sweet dreams at night. But in this also were we disappointed. By the time the morning sun beat down on the enclosure all morning and the Santa Ana winds paid their unwelcome calls and spread their carpets of dust on the floor, we gave up all thought of afternoon rest there, and the festive mosquito caused us to change our minds in regard to star gazing or sweet sleep and seek retreat behind screened doors and windows. But we were unwilling to give up that space. We wanted it and needed it, so we called in our good friend, the carpenter, and told him our troubles. After he had made some figures which seemed to agree with the contents of our pocketbook we told him to go ahead and try and outwit our annoyances. After he had finished his work the painter was called in and painted it a beautiful white. Now it was roofed, screened and painted. Curtains on large rods separated the porch into sleeping compartments. Rugs were placed on the floor and the sewing machine found a corner, a delightful little sewing room in itself. There was room and plenty for the beds, and this we find is the homiest thing in our whole house, and winter and summer, year after year, it is in use, a constant delight. Here our nights are spent in peaceful sleep out where the perfume of the roses and orange blossoms mingle and bring pleasant dreams and better health to all the household.

THE HOMIEST THING

By R. M. Hiatt, Ciboba, Arizona

As to what is the homiest thing, will say I think away down in the heart of every person there rests a fond remembrance of the old fireplace with its high dog irons, the crane that the hominy pot hung upon, the mantel or shelf above where the old wooden clock ticked off the time to you, while grandpa and grandma sat in the corners smoking their pipes, the old Dutch oven steaming with corn bread. Talk about your pianos and organs and phonographs, but O, give me an old easy chair with a soft sheepskin and the old fireplace and a good pipe of home grown tobacco and a cup of hard cider, and the smell of the corn bread and hominy and I am a millionaire. I could go on at a great length, but this is enough to bring any person's mind back to the days of the good old fireplace, and to say this is true and far ahead of any comforts of today.

THE HOMIEST THING

By "Mother," Hollister

When I first read your question, "What is the homiest thing in your home?" instantly I thought of my old easy chair. True, we have our little Ford, which seems almost a part of us, as my husband uses it in business constantly and for pleasure on many happy occasions. We have our electric washer and ironer, which makes a housekeeper's life 100 per cent more worth living, and our telephone which we have come to take very much for granted. We have a beautiful apricot orchard just coming into bearing in which my husband says our future is bound up—and altogether a very comfortable and promising though very humble country home.

But my old armchair! I have heard so much in poetry and song about "mother's old armchair," and I wonder if my babies will remember mine with that tender sentiment. Certainly they will hardly be able to remember mother in her hours of rest without it. We furnished our home very humbly, several pieces of the meager furniture being picked up at second hand stores, and I thought this chair quite a find. It is only a simple low wooden rocker with curved arms, and sister said when she saw it—I was buying it in anticipation of our first baby—"It will never do, for you will always be bumping the baby's head on those arms." But I soon became expert in avoiding that accident, and oh, the rapturous hours I have spent in that chair nursing my firstborn, easing his little pains, feasting my eyes on his unfolding beauties, and later consoling him in his childish troubles and telling him stories. Then three years later the whole program was repeated with little

(Continued on Page 893.)

THE CONTEST WINNERS

Never was such a problem put up to the Household Department as deciding on the prize winners in the contest for articles written on "The Homiest Thing." The reason will be plain to all who read in this and coming week's Cultivators what seem to the writers the homiest things in their homes. They have written from their hearts of the beautiful and sincere things in their lives that express the spirit of home. To many the fireplace has seemed the very embodiment of the home spirit; to others the library; to others some musical instrument; to others the garden or living porch. And the literary merit of the articles is equal to the sincerity of the thoughts expressed. So there's the problem: How is it possible to decide whose is best and whose is second best? The only solution we could find was to divide the prize money evenly among three of the articles which seemed typical of the best. Then, of course, to each one published goes one year's subscription to the Cultivator, so that all are, we feel, winners of real prizes.

The cash prizes go to "Mother," Hollister, Mrs. S. F. Korf, Napa, and Mrs. M. B., Lancaster.

Agricultural News Notes of the Pacific Coast

Northern California

Alameda County clalms most efficient fire equipment and patrol.

Petaluma is shipping great numbers of day old chicks by parcel post.

The Mendocino County farm bureau recently shipped 100 head of fat hogs from Ukiah.

Sonoma County farm bureau wool pool is making shipment of four cars Sonoma grown wool.

Oriental beans are still coming in to San Francisco, 3,500 sacks being received during March.

Cattlemen recently met at Montague, Siskiyou County, and planned auction sales of fat stock.

Glenn County Swine Growers Association is now fully organized. F. W. Leavitt of Willows is president.

A $25,000 stock company has been organized to promote and carry through the Sonoma County fair.

J. F. Watt is the new secretary of Reclamation District 2047, the largest in the state, comprising over 300,000 acres.

The Placer County Realty Board is in arms because of a Japanese having been granted a real estate agent's license.

The state commission of housing and immigration is making special study of the housing situation in Northern California.

Placer County farm bureau is registering high school boys and others who are willing to pick cherries or aid in other harvesting operations.

A committee, of which Judge Peter J. Shields is the head, has been organized to secure large appropriation for the university farm at Davis.

Agricultural employers recently held in San Francisco a conference with welfare commission and discussed minimum wage for farm workers.

Horticultural Commissioner Harry Stabler of Sutter County reports 2,607 acres of new orchards and vineyards planted in that county this season.

Agreement has been reached between rice growers and warehousemen on a basis of $2 per ton. The storage period for paddy rice shall be September 1 to August 31.

Amongst other supplies secured by the marketing bureau of Glenn County for members of the farm bureau are auto tires, arsenate of lead, alfalfa seed and all kinds of spray materials.

The Honcut irrigation district in Butte and Yuba Counties has obtained suitable storage reservoir and damsite which will increase storage area 800 acres and supply 43,000 acre-feet to the irrigation district.

The Livermore Stockmen's Protective Association has endorsed the state association and is urging individual members to become members of the larger organization. At the recent annual meeting J. McGlinchey was made president and J. J. Callaghan secretary.

Grape Growers Association of California has filed articles of incorporation. The incorporating directors are: C. E. Humbert of Cloverdale; C. L. Crawford, Ukiah; E. A. Flanagan, Napa; Frank T. Swett, Martinez; Andrew Johnson, Elk Grove; Albert Haentze, San Jose, and E. M. Sheehan, San Francisco.

Central California

Santa Cruz is becoming a liberal shipper of cheese and butter..

Paso Robles, San Luis Obispo County, wishes a creamery and a cannery.

Stanislaus County wool growers are planning formation of a marketing pool.

A local of the Farmers Union is to be established at Denair, Stanislaus County.

Merced County is planning new county fair grounds, race course, aviation field and the required fair buildings.

Linden, San Joaquin County, is appealing for a cannery for an outlet for large quantity of peaches and other fruits.

Barley buyers are offering around three cents per pound for new crop barley.

Dairymen of Kings County recently received $375,000 in cream checks to cover a period of 30 days.

Dr. Whitten of the University of California has held several pruning demonstrations in central counties.

The board of trade at Exeter, Tulare County, has been holding meetings at which farmers have discussed citrus June drop control.

Stanislaus County supervisors are being petitioned to organize Stanislaus Irrigation district which will include about 18,000 acres.

Kern County reports prospects for much larger apricot crop than usual. Cannery at Bakersfield will handle approximately 15,000 tons.

Farm bureau centers in Merced County have been taking votes on the picture bride practice of the Japanese. They are unanimously against it.

Nestle's Food people have purchased the Alpine Evaporated Milk Company's plants, located near Hollister, San Benito County, and Gonzales, Monterey County.

Central California olive growers are discussing methods of advertising or of giving correct information to Eastern consumers as to the healthfulness of olives.

The California Cattlemen's Association is making a special canvass of livestock men of Inyo County. The farm bureau is aiding in the organizing of stockmen.

At a recent fat hog sale at Turlock 15 cents was the highest bid received for a specially choice lot. There was only one bidder present; other offerings were withdrawn.

San Joaquin Valley points are restricting the sale of gas to pleasure cars to three gallons at a time, and no sale to those whose tanks contain reasonable amount of gasoline.

Inyo County farmers are taking steps to secure a farm adviser and a bureau has been organized at Bishop. R. W. Sears is president and A. A. Birely of Bishop is secretary.

The Farmers Union is making a drive for new members amongst Turlock, Stanislaus County, farmers. Turlock already has the largest membership of any section of the state.

Wine grape growers of the San Joaquin Valley are concerned regarding disposition of the government toward the shipment and disposal of wine grapes. At present high prices are being offered for dried wine grapes and "black" raisins.

Southern California

Riverside County farm bureau observed county clean-up day.

Much of last year's bean land is being put into sugar beets.

Imperial County farm bureau meettings will feature poultry demonstrations.

Carpinteria, Santa Barbara County, recently held its seventh annual flower show.

Imperial Valley irrigators have finally received permission to erect wier at Hanlon's heading.

Riverside farm bureau is holding poultry institute under direction of Prof. Dougherty this week.

The California Avocado Association has announced its next convention to be held at Santa Ana, October 9, 1920.

County Horticultural Commissioner Waite of Imperial County has 20 cantaloupe inspectors ready for the shipping season.

C. E. Millspaugh has become head of the California Honey Producers Exchange. The output of the exchange will be large.

Calipatria, northern Imperial County, has finished replanting its cotton crop, made necessary by high winds a few weeks ago.

Prof. Coit's class in citriculture from the state university will soon take a trip through the Southern California citrus orchards.

Farmers Alliance men from the South are urging organization of Farmers Alliances in cotton growing sections of California.

A Pomona orange grower has discovered a seedling orange of exceptionally high quality which may be reproduced in large numbers.

San Fernando Valley walnut growers are organizing a branch of the California Walnut Growers Association. Warehouse will be erected at once.

"Heaviest hay crop in years" is reported from almost every Southern California section. The showers of last week did considerable damage to the hay crop.

The directors of the Palo Verde levee district have passed resolutions with intent to prevent irrigators from using waters from drainage canal for irrigation purposes.

Santa Susana, Ventura County, made a test planting of 150 acres of cabbage but finds the first crop has not matured satisfactorily. The experiment will be discontinued.

Apple growers of Yucaipa and Oak Glen sections of San Bernardino County are giving more careful attention to spraying for codling moth. They expect to ship worm free fruit this season.

Poultrymen of Van Nuys recently received bids for poultry manure, the highest of which was 12 cents per cubic foot for Number One. The San Fernando Valley ships many cars of poultry manure to citrus sections.

The Elsinore farm bureau center is initiating a movement to secure reenactment of the poll tax law, excepting that "all males between the ages of 21 and 60 shall pay $5, excepting all who are property owners and now paying in excess of $5 in personal property or real estate."

The Coast and General

Arizona cotton is three weeks late than usual.

Oil has been found in the vicinity o Fallon, Nevada.

Farmers Chautauqua meets at Spokane, June 24, 25.

The Washington State Grange meet in annual session at Aberdeen, Jun 1-4.

Vancouver, British Columbia, is paying ten cents per pound for straberries.

The first cotton blossoms of t season were brought into Phoeni May 11.

Loganberry growers in Marion Cou ty, Oregon, have rejected offers of 1 cents per pound.

The Whatcom County Beekeeper Association will meet at Ferndal Washington, June 8.

The new lumber mill at Cooley, A zona, in Navajo County, is turning ou 200,000 feet of lumber a day.

Loganberry growers near Salem, Oregon, are contracting to deliver nea 5,000 tons at 10 cents per pound.

The number of automobile license in the state of Arizona is 28,584 up t the first of May. Of these, 11,800 ar in Maricopa County.

Spokane dairy market complains b cause of shortage of dairy suppli which is holding up both butter an eggs. Eggs are now quoted at $13 2 per case.

A series of cotton lectures is bei planned to be held in different parts o the Salt River Valley under the au pices of the Arizona American-Egyp tion Cotton Growers Association.

A firm of New York potato deale has attacked the constitutionality the Lever food control act. The co cern had been charged with profiteering in potatoes and will carry the c to the supreme court.

It is reported that cotton mills Japan are paying an average dividen of 50.20 per cent for the first half the year's business. About half their cotton supply comes from Ind and most of the rest from China

According to the latest estimates the U. S. department of agricultur bureau of crop estimates, the acrea of long staple cotton in the Salt Riv Valley is 185,000. It is probable th the planting of alfalfa has been duced from 85,000 acres last year about 40,000 acres this year.

A number of boys of the agricultur department of the Phoenix union hi school are to engage in a hog raisi project. The financing of the proje is arranged through one of the lo banks and some Poland China pi were obtained from a local breede Records of the cost of production w be kept and the pigs will be sho at the fair here, the winner will r ceive due recognition.

Mrs. M. Armer, the angora goat queen of America, is making a surv of the Angora goat industry in Ar zona with a view to uniting the grow ers in an effort to sell mohair to b ter advantage. It has recently bee suggested that mohair might be used to advantage in the manufacture of automobile tire fabric. At the present time the market price of mohair is considerably less than that of long staple cotton.

Field Lecture on Soils

By Ernest Braunton

PROF. J. W. NELSON of the state college of agriculture gave a field lecture on soils in the lemon orchard of E. F. Underhill, near Glendora, May 14, under the direction of the Los Angeles County farm bureau. Aside from being a vigorous speaker, Prof. Nelson is also a vigorous wielder of the shovel and dug holes in rocky soil for the further entertainment of his audience.

At the close of the performance Mr. and Mrs. Underhill provided an ample lunch under a spreading live oak in midfield. Under this tree is a permanent cobblestone fireplace and stove; tables, benches, etc., built especially to provide comfort and cheer for farmers' meetings. Some of the chief points of Prof. Nelson's speech are herein recorded.

"Agriculture is the present and future base of the prosperity of Los Angeles and other counties of the South. The oil product is a factor, but the former much heralded tourist crop now awakens little interest in the farmer. I state this much to call your attention to the fact that agriculture is nearly our only wealth producing industry and must be protected and fostered or we shall fall into the errors common to other new agricultural sections, some of which are indeed alarming. The crop production in vast stretches of this country heretofore fertile are each year decreasing and the lands may yet revert to the primeval plains.

Mismanagement of Soils

"I have traveled much in that stretch of country that depends for water upon rainfall alone, the Dakotas, Kansas and on to the Mexican line. In Kansas it has been found that the organic matter in the average soil has decreased from its virgin state about 30 per cent, and the crop yields have fallen off to a like extent. Potash and some other plant foods are there in plenty, but unavailable, locked up, while crops are starving. Sufficient soil moisture and organic content is the double bitted key that will unlock the stored wealth. Kansas is making frantic endeavors to correct the evil, and unless she succeeds in the next 50 years the lands will go back to the wild, for even now the organic matter is gone and the rainfall is limited.

"We are approaching the same conditions. We have been pulling on the resources of the soil, in some parts, for 50 years. The tendency of American agriculture has ever been to depiete soils of plant food. The remedy is introduction of organic matter and control of soil moisture. We too have plenty of potash, but it is locked up. Pure oxygen and pure water entering the soil gives us but the same conditions as above the soil, good for animal life but death to plant life. These elements have no power, unaided, to liberate foods in the soil. Analyses show that atmospheres where plants thrive would not retain life in man for five minutes. Decomposition must be accomplished and the foods liberated.

"We have in California soils and climatic environment suitable for every crop. Find this out—experiment; specialize. Some sections now growing citrus crops will give them up; other cultivated sections will turn to citrus. Our soils need classification, and for the first time the United States bureau of soils and the state college of agriculture are cooperating in this work. A soil survey and study of soils to the depth of at least three and one-half feet has been made over 85 per cent of California. A crop map is also now being prepared that charts every ranch of two and a half or more acres, from San Bernardino to the sea.

Farmer's First Duty

"The first duty of every farmer is to consult his soil to determine what crop is best for him to grow. In the past we have been too much dependent upon others. Merchants and those in other lines do not ask outsiders what to do; why should farmers? Find out for yourselves. Study nature; she will serve as a guide. Each year in California $1,000,000 in fertilizers is wasted for lack of intelligent use. Tens of thousands are spent, unintelligently for soil inoculation, not always needed, and again, not always given where needed. Purchase on the basis of local instead of general soil needs. Trained men from the state university, also your farm advisers, are seeking to help all to help themselves. They will show you how to do it—how you should do it yourselves. In the past there has been too much secrecy. Farmers have experimented and have kept the results of such experiments to themselves, whether successes or failures. They are now organizing for the common good of all. That is where the farm bureau steps in.

"Soil is the factor we are dealing with here today. This was brought down from the mountains to where we stand by streams, into great alluvial fans. A few years ago these sandy, rocky soils were thought to be worthless. But trees root at least one foot deeper in these than in heavier soils. Openness gives perfect drainage; some heavier soils hold too much water and heavy subsoils are a menace, as roots soon suffer after heavy irrigation, especially if followed by hot weather. Heavy irrigations on heavy soils have killed many citrus orchards. Undulating hard subsoils form check dams for excess water and roots are poisoned. Light soils need more feeding but you can afford to do it. One ton of organic matter added will increase the water holding capacity six or eight tons. More potash and nitrogen are needed, the latter to build up tree energy to sustain the coming crop. Organic matter is most needed and supplement this with commercial fertilizers. Experiment to see just what is needed.

The Soil Sponge

"The soil sponge is composed of organic matter of all kinds and absorbs and holds water as the sponge proper. Where it is present ideal conditions for plant life prevail. Color tells the amount of organic matter in a soil. In black soils calcium carbonate or lime has converted organic matter into humus. In many soils of lighter color lack of lime has left them lighter because of lack of conversion of organic matter. Foods are easily carried out of soils low in organic matter. Try to imitate nature through use of organic matter, water and lime. Clean culture is a destructive process; we must have cover crops or barnyard manure or orchards will soon become vineyards.

"I lately met a man in San Bernardino who buys manure in all the Western states just east of the Rockies. Most of it goes to the potato fields of Maine. If it pays to ship it from Montana to Maine it will pay well to ship it from Montana to California. Farmers should cooperate through the farm bureau to buy and hold all barnyard manure in the Western states. Save the liquids too, for in them lies 60 per cent or more of the total value. The great Middle West doesn't badly need its manure at present, so get it, for the time will come when they will find they need it and will hold it.

Cover Crops

"Many cover crops are burnt out by summer tillage. Double crop if you can. I know an orchard where the yield was going down each year; mottle leaf was very bad. For seven years the orchard has not been plowed. Both winter and summer cover crops have been grown and disked into the surface soil. After seven years of this the surface soil is a perfect mulch, the mottle leaf is cured and the trees are perfect. He has also applied 20 tons of lime to the acre, doubtless too much, but his soil is fine. His nearest neighbor grew but a winter cover crop and one summer lost his full crop through drop.

"Tests have proven that where the surface temperature was 130 to 150 degrees under bare tillage, a few feet away under a cover crop the temperature ranged from ten to 20 degrees lower, just right for best bacterial action. One orchardist found water percolated 20 inches in 48 hours. After several years double cropping the figures were reversed; it now percolates 48 inches in 20 hours. At first one-third to one-half more water was needed than now for either crop. Now but little more than the same amount is necessary for both crops. Every farmer should get a soil auger and test down at least four feet. Don't leave a strip of four feet in the row where no water is applied. This leaves 15 per cent or more of your soil out of action during the active season. Inside dead wood is a result. When rains come 100 per cent of the roots function and this often results in disastrous premature blooming.

"Do not test the soil by kicking a hole with your foot and guessing it needs water. Do not wait until the trees show need of it; it is then too late. The tree gets a severe shock from lack of water. Then a heavy irrigation is given, with another shock, for the tree is out of condition to immediately use the water. If this occurs once a month during the summer and the trees require five days each time to readjust from the two shocks, nearly a month, perhaps more, is lost in the normal functioning of each tree. Consult the soil, not the tree. Use the soil auger in heavy soil, the shovel in light or rocky soil. A little practice will enable anyone to judge of the water content of a soil. Keep moisture content permanent but do not overirrigate; rather underirrigate. Investigate for lateral as well as for depth percolation. Dig between the rows and in the rows, close to the trees, as well as in the center of the squares."

The Awful Cost of Carelessness

LOSSES from fires in the United States last year, totaled something over fifty millions of dollars. This does not include the losses from forest and field fires, which indirectly might perhaps amount to as much more to irrigators and others. Besides this financial loss, there was a loss of life, estimated by some to be possibly as great as 15,000 human beings.

New York was the heaviest loser, with approximately thirty-six millions of dollars. Following in order come New Jersey, Pennsylvania, Illinois, and, next, California. The National Board of Fire Underwriters has made careful investigation and finds that nearly thirteen millions of this loss was due to defective flues; well up towards half a million to fireworks, firecrackers, etc.; something over four millions to open lights or lamps, candles, etc.; gasoline, coal oil, etc., are responsible for about seven millions; rubbish barrels, for nearly another million; sparks lighting on roofs, about seven millions; defective plumbing, another million; stoves and furnaces, thirteen millions more; electrical flatirons and other electrical appliances, the enormous total of twenty-one millions. Criminally set or incendiary fires get off comparatively easy, with only three millions. Lightning is responsible for nearly another ten millions. Amongst the greatest culprits in the careless setting of fires are matches, and carelessly thrown cigarettes and cigar stubs. Nearly twenty millions of dollars are required to cover this great loss. If figures could be secured as to California's losses we believe the percentage would show a still greater charge to be made to this form of carelessness in this state.

The California state board of forestry has issued Circular No. 7, "Grain, Pasture and Hay Fires in California During 1919." Its first statement is:

"The destruction by fire of grain, hay and pasture in the valleys of California during the season of 1919 exceeds that of any year for which records are available. The high loss was largely due to the following reasons:

"Failure to clear roadsides of inflammable material.

"Lack of precaution in safeguarding grain and hay fields by plowing furrows and cutting hay strips.

"Careless burning of grass and stubble.

Carelessness with matches and burning tobacco, particularly on the part of the traveling public.

"Failure to safeguard tractors and trucks with safe spark arresters.

"Strong winds from 30 to 35 miles per hour that fanned any sparks of fire dropped in grain fields or on adjoining roads.

"Lack of organization and proper fire fighting equipment."

Castle Peak Fire Lookout

Interior view of lookout observatory, showing top of table, sliding map-board with map, peep-sight with alidade, invented on District Two. Photo taken in Holy Cross National Forest, Colorado.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Look at the cover illustration and think of a whole mountain afire. It may be sufficient to remind of the time last fall when not only one mountain, but many of them, were a mass of fire from top to bottom. It was a wonderful scene, but one for which we do not care to pay the full cost. We are paying it, however, and will be for years to come.

All together, please, HELP PREVENT FIRES!

FLOWERS FOR PATRIOTS

"Worthy patriots, dear to God and famous to all ages," are worthy of flowers on their graves today, and from one side of the country to the other flowers will be heaped upon them. And let the flowers be from our own gardens. As we heard it expressed the other day: "'Boughten' flowers are not for Memorial Day." When we are offering flowers of our own growing, we are offering of our own lives. Let us grow our own offerings.

LIBERTYS STILL DOWN

Another possible reason why Liberty Bonds are in such disfavor at this moment is given in the following from the federal reserve bank of the twelfth district: "The secretary of the treasury is offering approximately a $100,000,000 issue of treasury certificates of indebtedness, carrying five and a half per cent interest, etc."

Naturally the banker and larger handlers of the finances of the country invest quickly in such paper, which carries a high rate of interest and matures within a very few months. Naturally this attractive investment has driven Liberty Bonds into the market and we, the common people, are getting a chance to buy them at wonderfully attractive prices. It is a long time before some of them mature, but we believe the government will yet correct its way and these bonds will return—and not many years, possibly months, hence, to par or a higher value.

HOUSE OR HOME?

Two were talking of their homes. One told of its conveniences, the cosy corner, inspiring pictures, musical instruments, books. The other spoke little of the house, in fact, remarked: "I have no house, but a wonderful little home." From the description, perhaps it would not be amongst the Nob Hill residences shown to tourists to prove the progressiveness of the community, yet withal, well-kept vines, a neat lawn and an exterior which is not forbidding. Presumably it contained the homiest of things which are referred to on the third page of this issue and in the household department. The household department has been asking Cultivator readers to tell of those things which enter into the hominess and add to the happiness of all of us. And the request has brought some little classics which make clear some of the home scenes in California.

VALUE OF THRIFT

Speaking of the necessity for thrift, its value in sustaining the credit of our government by helping to hold up the price of bonds, and in other ways, a former member of the federal shipping board suggests that "Thrift and savings make the only citizenship. When the violent Red gets a little account in the savings bank, he turns a delicate pink." To this it has been suggested that he might add: "When the Red is thrifty enough to acquire a home of his own, he becomes almost white."

There would be vastly less of strikes, of disturbances, of discontent, if the habit of thrift could be so increased that we might all become home owners. Too many of us are still tenants, though we believe that California's high citizenship proves that we are of the greatest of home owners.

FREE CABBAGE

The quickness with which the results of a year's labor, and the little surplus which was expected, become a loss, even a disaster, is shown by a little note on the market page of the Los Angeles Times of last Tuesday. It referred to the slump in cabbage because of the freight tie-up due to the strike in the midst of the cabbage season, and to the further fact that cabbages were practically being given away by the growers, and added: "Theoretically one cent per pound was to be charged at the roadside, but actually the visitors helped themselves. The unfortunate growers looked on or assisted in the distribution of a crop the loss of which means in some instances the abandonment of the effort to make a living by farming."

These ruined farmers, compelled to give up their little homes, will wait many years before speaking very kindly of the class of agitators which is supporting the labor strike.

BOY SCOUTS

Next week will be Boy Scout Week. The program begins on Sunday, when talks will be made in all the churches of the land on the boy scout as a helpful factor in every community. The remainder of the week, up to and including June 6, will be given to field days, lessons in tent pitching, fire building and protection, wall scaling, signalling, and demonstrations of various kinds, even to camp cookery. Boy scouts are naturally active at all times, but they were especially so during the war period, being employed as gleaners in War Savings Stamp, Red Cross and even Liberty Bond campaigns. They are helpers in good health and clean-up campaigns, and are generally laying the foundation for a bigger and better and finer citizenship—"physically strong, mentally awake, morally straight."

Here's to the boy scouts, and this is a good week in which we may all prove ourselves to be good scouts and limber up and encourage the boys.

FIRE PREVENTION

All the West is talking fire prevention this week. Note the word and its meaning: It is prevention and has nothing to do with the putting out of fires once started. Of course, it goes without saying that the various county volunteer fire departments are organized for the purpose of extinguishing fires, but better than all is the putting out of these fires before they are ever started. This means that the camper, the auto tourist with roadside fire, the hunter with his gun wads, the rubbish burner or bonfire maker, the smoker, with his matches and stubs—all of us—shall take every precaution to prevent the hundreds of millions of losses, or at least as great a portion of them as is in our power. Of course, some of these fires have been set with criminal intent, but by far the greatest proportion of the losses is an indictment of American carelessness. Three hundred and fifty millions of cash loss and fifteen thousand human lives are given up annually because of carelessness.

CARRY INSURANCE

Some property holders seem to consider that fire protection consists in keeping the endangered property covered by insurance. From the individual standpoint the destruction by fire of a thousand dollars worth of property covered with eight or nine hundred dollars insurance means but slight loss; from a national standpoint a fire means total destruction of resources. Nevertheless, the wise individual insures.

"How?" That's a question which we will answer, as we have similar questions thousands of times before—"Cooperate."

The Pacific Coast is sending annually millions of its capital to great Eastern financial institutions in order to secure a fire protection which can be carried at home, and by "at home" we mean the local home community. There are something over a score of cooperating county or local insurance concerns in California. Not every one is reaching highest success in piling up reserve funds, but every one is giving a safe and economical protection. The largest has a reserve of only some $60,000 or $70,000. Some of them have no reserve whatever, other than the cooperative spirit of the members, that is, practically no reserve fund is retained in the treasury, but in case of loss assessment is made sufficient only to cover the one fire. We believe the cooperators who would secure greatest success for these organizations would be wise to follow the example of those companies which are creating a reserve fund. However, we will admit the principal factor in the success of these organizations is the true cooperative spirit.

USE OUR CREDIT

The National Stockman Farmer remarked:

"The fact that agricultural and livestock notes formed only one-fiftieth of one per cent of the paper rediscounted with the federal reserve bank of Cleveland last year indicates that agriculture is pretty well able to finance itself in this territory or that those who follow it do not use their credit and credit institutions as do other business men. No doubt farmers need more credit than they get, also they can get much more than they do. Farmers do not use their banks as they might, a result perhaps of a habit the banks have helped to form, for there was a time when farmers' deposits were welcome and their notes not wanted. Whatever may be the reasons for past events and tendencies the future should be different. Farmers should do as all other business men do, establish their bank credit and use it."

Then it enlarges upon the advantage and increased business made possible by this greater use of credit. Many a farmer suffers from lack of capital, but the question is, "Can he afford to secure this greater capital at the rate of interest which agriculture is compelled to pay?" He suffers a handicap of some two or three per cent higher rate of interest than is charged to industrial or commercial interests. It is not good business for him to pay that high rate of interest and endeavor to get by with farming operations. It is not only not best; it is not possible.

BE MIXERS

Director Hecke of the state department of agriculture thinks we farmers ought to mix more with the urbanites. He says:

"Recently a most valuable idea was followed out when the movement was brought into play in the Sacramento Rotary Club by which 'farmer business' shook hands with his urban brother, 'city business.' And when we come to analyze the situation critically we wonder why it was not done long ago. Farmers from counties surrounding Sacramento City visited with the Sacramento Rotary Club at luncheon, and the Rotarians in turn visited with the farmers at the university farm at Davis.

"The farmer of today is emerging from the reconstruction with a first class title to a first class place in the economy of affairs. Whereas in the past he was so busy with the work of providing food and clothing for others that he had little time for "deep reading" and permitted those with less work and more time to frame up the issues for him to sign, from now on he is going to be heard from on the questions which vitally affect him and which, through his farmer business of producing, vitally affect everyone else."

Well, it may be we should mix more and get in touch with the big idea of the big town. The urbanite doesn't mean to be, but there have been occasions when it appeared that he was altogether too patronizing. But it may be that if we could get closer together we would realize we haven't been as far apart at any time as we have imagined.

J. M. COOK'S PATENT
Automatic Ridger and Blocker

Operated by Tractor Driver. Saves 50 per cent on Labor. Ridges and Blocks at same operation. Is indestructible. Has all Necessary Adjustments for Different Soils. Leaves Side Ditches Clear, and puts up any size of block QUICK and ACCURATE.

STANDARDIZATION WORK IN THE NORTH

For the following facts concerning standardization work in and around San Francisco we are indebted to S. V. Christierson, standardization inspector of the state department of agriculture:

"Standardization work in the northern part of the state has during the spring of 1920 been confined to a very large extent to inspection of apples being repacked and coming out of storage in San Francisco and in Watsonville. Efforts have been made to place these apples on the market in as good a condition as is possible after a period of from three to five months in storage. Excellent work has been done on the markets of San Francisco by Horticultural Inspector Wm. J. Burke, under the supervision of Dudley Moulton, horticultural commissioner of San Francisco County. This is also true of the markets in Oakland which are being handled by Deputy Horticultural Commissioner D. P. T. Macdonald, under the supervision of Commissioner Fred Seulberger. Although they are necessarily limited in their activities as they have no assistants, and are handling the markets alone, the markets of both San Francisco and Oakland compare very favorably with the excellent condition found on the Los Angeles markets.

"During the months of January and February the district apple inspector for the northern part of the state, W. I. Newcomb, was located in San Francisco, pursuant to a policy which placed him there early last fall to check up as far as possible on the apple shipments arriving daily on the San Francisco markets.

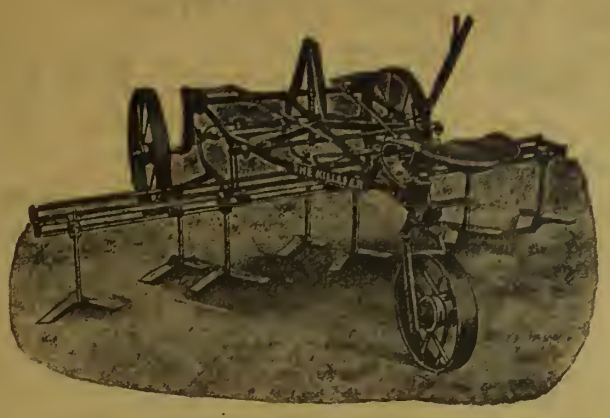
"These remarks on the activities along the line of standardization would not be complete should no mention be made of the strawberry situation in the northern part of the state at this time. The Central California Berry Growers have adopted a raised bottom basket and are not packing their berries, in other words they are being shipped into the market in the same manner as they are coming into the Los Angeles market at the present time, that is, loose without facing or topping. This practice has not met with universal favor as the consumer in the northern markets is accustomed to the smooth finished appearance of the faced basket. However, we have reason to believe that this year's work will be an education to the consumer who is now finding himself in the position of a man who pays for what he gets and is pleased when, on carrying his berries home, he finds the same quality and condition and frequently size, in the center and bottom of the basket as he finds on the top.

"I should hesitate to complete these statements without a word of praise for the excellent work that Mr. Ryan has done in standardization work in the Los Angeles markets. Mr. Ryan is indeed to be congratulated on his vigorous campaign to protect the consumers in obtaining a square deal and is a firm believer in the motto of the office of standardization, which means to the consumer an honest pack, a sound product, and full value, and to the producer an assured market, increased demand, and satisfied customers?

NITROGEN NODULES

In going over a young lemon orchard on sandy, rocky soil near Glendora it was noticed that a few Melilotus Indica were scattered over the field. The occasional one close to the trees was tall and vigorous, of dark color, those between the rows were in every way inferior. Several in each class, or position, were pulled up, for the soil was a loose gravel. Those far away from the trees had no nodules on the roots; those close under the trees were loaded with them. The problem was of easy solution. The owner stated he had several times fertilized beneath the trees, but not over the soil in general. No proper media for bacterial action was present except under the trees. In the "hungry" gravel there was nothing present to ferment. After the first cover crop has been turned under on such soil, bacterial action will become very marked and subsequent cover crops will show vigorous growth and the roots be found well supplied with nitrogen nodules.—E. B.

FOUR ROW BEAN CULTIVATOR



Killefer Efficiency

One man with two good size horses or small tractor, can cultivate four rows of beans with this cultivator. This, like most of our implements, has been developed at the request of ranchers, for a strong, simply controlled cultivator, capable of doing their work better than would be possible with a lighter made tool.

The frame is made of one piece high carbon steel with no joints to work loose or sag and holds the wheels always true and in line with balance of the cultivator. The double frame bar gives ample clearance between the standards and eliminates to a great extent, the tendency to clog in trashy ground. This frame bar has a double lifting device which holds it rigidly on both sides; the steering device is easily operated and very accurate.

The cultivator is equipped with K. Q. sweeps of our own design, which will do better work and wear longer than the equipment usually furnished with other makes of bean cultivators. Standards can be set to cultivate rows of any width from 20 to 36 inches.

All repair parts are carried in stock so there will be no long waiting in case of a break down. We make this cultivator in two weights, four row regular and four row extra heavy. We also make a two row cultivator.

GAS TRACTOR SHORT COURSE JUNE 1-11

"It all depends upon the operator," are the words of tractor manufacturers, salesmen and service men, when speaking of the success or failure of their machine.

Making better operators is the main purpose of the gas tractor short course which is to be held from June 1 to 11 at the university farm at Davis.

This course will also interest those who are considering the purchase of a tractor or who wish to get up to date on tractor construction. Each student will learn certain definite things at this course, such as how to locate and remedy motor troubles, how to adjust carburctors, time magnetos, babbitt and scrape bearings, repair radiators and judge good features of tractor construction, etc.

The enrollment is limited to 180, so if you plan to come, send in your application now to the Dean, University Farm School, Davis. The fee for the course is $1. Board and room may be secured at the university farm dormitories and cafeteria, and should not exceed $20 for the course.

Write for further information if interested.

YEAR BOOK, U. S. D. A.

The Year Book of the department of agriculture for 1919 is now available. We believe that when this book is ordered direct from department of agriculture or rather from the Public Printer, Washington, D. C., that a remittance of $1 is required, but if subscribers to the California Cultivator will write to their congressman or one of the state senators it may be secured without cost. The Year Book contains report of the secretary of agriculture. However, this only covers some 50 pages. There are special reports on Contagious Animal Diseases, Tile Drainage, Atmospheric Nitrogen for Fertilizers, Farm Practices in Growing Wheat, Three Centuries of Growing Tobacco, Hog Cholera Control, Marketing and Purchasing Demonstrations in the South, Electric Light and Power in the Farm Home, Common Sense in Poultry Keeping, What the Farmer Should Expect From the Seedsman, Fight Against the Pink Bollworm, Trapping on the Farm, The Horse Power Problem on the Farm and many other special articles, together with tabulated statistics. The California representatives may be addressed in Washington as follows: Senators, James D. Phelan, Hiram W. Johnson. Representatives, District No. 1, Clarence F. Lea; 2, John E. Raker; 3, Charles F. Curry, 4, Julius Kahn; 5, John I. Nolan; 6, John A. Elston; 7, H. E. Barbour; 8, Hugh S. Hersman; 9, Charles H. Randall; 10, Henry Z. Osborne; 11, William Kettner.

WALNUT SOIL DEMONSTRATION

Under the auspices of the Los Angeles County farm bureau a lecture on soils and demonstrations through borings were held in the orchard of B. F. Maxon, West Covina, May 14. The chief speaker was Dr. L. D. Batchelor of the Riverside experiment station. D. C. Wylie, manager field department of the California Walnut Growers Association presided at the auger, assisted by many willing ranchers. The chief points of Dr. Batchelor's address are here given.

"The walnut grower must know that he is wetting his soil for at least eight feet in depth. During July the soil must be full of moisture or nuts will not fill. In August if soil is dry 'stick-tights' or tight husks will result. Autumn finds some soils so dry that leaves do not properly mature before dropping and winter die-back results. Winter's rains often come just in time to save the trees but still not in sufficient volume to wet deep enough.

"The standard of the crop is set by June 1 so that early moisture is most important. It is then decided by the tree how many number one, number two, or culls it will yield. The penetration of rains should be closely studied by each orchardist as soil texture differs much, in some localities even within a few hundred feet. It is conceded that in ordinary soils an inch to an inch and a half of rain is required to wet down one foot, therefore the necessary eight feet for walnuts requires eight to 12 inches of rain if soil is dry. In soils given 15 acre-inches in March a test shows plenty of moisture at six feet and probably no further supply is needed until July.

"There is a disadvantage in many localities in using the basin method of irrigation. This is especially true where soil is light and winds are strong. Owing to the heavy top many trees blow over under these conditions. A zone of dry soil next the tree is needed for stability and protection against either strong prevailing breezes or occasional high winds. Orchardists should make many borings in an orchard to determine if both depth and lateral percolation are the same in all parts. More water may be needed in some parts than in others."

Borings were then made in three widely separated parts of the orchard to the depth of ten feet. In each case the moisture content was satisfactory and the soil similar in texture throughout though the surface soil was darker in color by reason of humus content. The last irrigation was given in December. This condition was declared unusual and indicative of the highest type of walnut lands. At the close of Dr. Batchelor's talk Prof. Nelson spoke briefly on soil problems on much the same general lines as reported elsewhere from the citrus orchard, but with more especial application to walnut soils.—E. B.

ERADICATION OF CITRUS WHITEFLY

Harry S. Smith, entomologist in charge of the office of pest control, California department of agriculture writes:

"For a number of years one of the citrus feeding species of whiteflies has existed on the Stockdale Ranch near Bakersfield. An attempt was made by the old state horticultural commission to eradicate the pest on this ranch, but without success. Viewing the occurrence of this insect at Bakersfield as a menace to the citrus industry in Southern California, another attempt at eradication has just been completed through the cooperation of the county horticultural commissioner of Kern County and the office of pest control. Kent S. Knowlton, the county horticultural commissioner at Bakersfield, and Mr. Branigan of this office have given the work their personal supervision and it has been painstakingly carried on. Approximately $750 was spent by the county and the Stockdale Ranch. It is hoped that this will mark the end of the infestation, but the work will be followed up with frequent careful inspections."

NEW STRAWBERRY PEST BREAKS OUT IN CALIFORNIA

What is probably the most serious pest of strawberries in the United States has recently appeared in California. D. P. T. MacDonald, deputy horticultural commissioner of Alameda County, last week called the attention of the office of pest control to the serious damage being done to strawberry plants at Mt. Eden, near Hayward, Alameda County, by a root infesting grub. Examination showed it to be one of the strawberry root weevils of which there are several species. This has later been determined by Dr Van Dyke as otiorhynchus rugifrons.

The pest works on the roots of the plants, killing it outright and generally the destruction is complete in the area where it is found, no plants being left in a healthy condition. The adult is wingless so that the distribution is slow, excepting where the plants or soil are moved or where irrigation water is permitted to run through the infested portion of the patch.

The strawberry root weevil is a serious menace to the future of the strawberry industry in California, and an effort will be made to eradicate it unless it is found to be so widely distributed that such an attempt will prove impractical. County commissioners can aid greatly in determining what should be done by instructing their inspectors to look for the pest in their districts.

This weevil undoubtedly came in on strawberry plants from the Northwest four years ago, the particular plants in the infested area having been purchased in Oregon.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Rose Rust

We have a large rose bush completely covered with rust and it is dying. What shall we do with it?—Subscriber, Puente.

A bush so badly affected and dying should be dug up and burned so its spores will not affect other foliage. Spraying with Bordeaux mixture will usually control this rust. As it spreads slowly watch your bushes and pick off and burn all affected foliage; then spray.

Tomato Profits

How many tons of tomatoes can be produced on an acre? What is the cost of picking a ton? What are the canneries offering per ton? How late may one plant?—Subscriber, Lemoore.

The range of production is from five to 25 tons an acre, dependent upon soil and season, not so much upon culture, as with ordinary care under good natural conditions crops are generally good. Three years ago the cost of picking was $2 a ton, but it has been steadily climbing until this season the cost will range from $4 to $4.50. Canneries in the south are paying $20 per ton and this price generally prevails for good fruit. Some sales in other parts of the state are reported as low as $15 to $18, but it is thought this was for poor stock. The planting season for winter crop ranges from May 1 to August.

Katydids, Aphids, Scales

Please tell me what is on the enclosed apple twigs. I have sprayed them with arsenate of lead, but it has done no good.—Subscriber, Van Nuys.

The twig with large scales in two straight rows is infested with katydid eggs. This and other twigs also have on them San Jose scale and woolly aphis. The latter is hard to eliminate but not hard to control if trees are sprayed each spring when dormant. A thorough spraying next spring with lime-sulphur, ten per cent solution, will fairly clean your trees. Nothing should be done at present.

High Rentals

Why should Imperial Valley land, as stated on page 781 in the May 8 issue, bring an annual rental of $45 per acre? The lands but a few years ago commanded at government prices $1 per acre; water was conveyed to the land at a cost of five or ten days work per acre or not over $30 cash, leveling, placing levees, ditches, etc., say not to exceed $135, total cost $166.—J. R., Bloomington.

The rental of some of California's agricultural lands has risen so high that it is impossible for the average farmer to raise average crops and pay the rent. There are special crops under special conditions where $45 per acre is perhaps reasonable, but these special conditions are allowed to influence the prices charged for other lands not so favorably situated. The result is ruin for many a man who has not used special judgment in taking lands at such prices, which with his inexperience has caused complete failure. But to answer more directly our inquirer as to whose fault it is and to call attention to this unjust situation, we may say that we believe rentals have been affected more by the Japanese than by any other one factor. They have been able with their intensive efforts and self denial to produce some great crops, they live on a plane an American could not possibly touch and "get by" under these enormous rentals. This has compelled the American renter to pay an equal price. In other words it comes back to "supply and demand."

Chick Feed

Here are two poultry foods, one of which was sample from which I made purchase, the other is from the sack of goods which was really delivered, and on feeding chicks with this food had several hundred die the first day. Does it contain poison or what was the cause of the chicks death?—Subscriber.

It is impossible on such meager information to give cause of the death of the chicks. An analysis of the feeds would be necessary and if there is reasonably good evidence that the feed was poisonous the University of California through its chemical laboratory could give the best information. However, the feeds were referred to Professor Dougherty, chief of the poultry division, and he answers as follows: "We have examined the two samples of feed carefully, and while there is undoubtedly a difference in these two samples it is not possible for us to make an analysis. This work will have to be done by the pure food and drugs laboratory, provided that there is good ground for the belief that the food sent by the dealer to the poultryman contains poisonous materials. I would earnestly question this and believe the trouble has been produced primarily by the method of feeding and perhaps by the fact that the mash used is a laying mash and contains certain feeds which, while satisfactory for adult stock, are too indigestible for young stock. We do not believe at present that a mixture containing coconut meal or cottonseed meal should be fed to baby chicks."

Spraying Citrus

Is there a law to compel a man to spray his citrus trees that are covered with scale? Trees are next to clean grove.—Subscriber, Buena Park.

Yes, the law is very stringent in the matter of horticultural pests. In case neighboring trees are infested the matter should be reported to your county horticultural commissioner—in your case, Earl Morris, Santa Ana.

Nematodes

As new subscribers we are very much interested in nematodes. Is it a disease or what is commonly known as wireworm? What is the remedy?—Subscriber, Bellflower.

The nematodes are often called eelworms in potatoes. Wireworms are much larger and entirely different. As to remedy there seems to be none within economic bounds. However, one must observe the greatest caution in choosing seed potatoes so as not to carry the pest into the soil. Hence the only treatment is prevention.

Corn Ear Worm

Is there any satisfactory method of controlling corn ear worm? — Subscriber.

Very satisfactory results have been had from use of dry arsenate of lead. The more common method of using is to place in small bag of coarse muslin which is shaken over the tips of the ears as the silk begins forming. Do not use too freely as a light sprinkling seems sufficient. Repeat after a few days.

THE BLACK BLOW FLY

At this season of the year it behooves the stock raisers of California to devote serious attention to the combating of blow flies. One species of this pest has already made its appearance; namely, the black blow fly. This insect is of medium size and uniformly bluish black in color, except the eyes, which present a reddish tinge.

The favorite breeding place of this insect is in the putrefactive tissues of dead animals. In the living animal the fly prefers to deposit its eggs on soiled healthy areas and suppurative sores. Heavily wooled sheep are the ones most commonly attacked by the maggots of this fly. The eggs are deposited on the rump of unshorn ewes following lambing and around the horns of bucks when the horns have become injured at the base. The maggots first attack the wool of the ewes, but gradually penetrate to the skin and then under it and may eventually kill the animal. In the buck the seat of infestation gives the maggots easy access to the ear, and oftentimes the animal thus attacked becomes useless.

To prevent the multitudinous breeding of these flies carcasses should be buried deeply or burned soon after death. Wounds infested by the maggots may be treated by pouring into the wound a small quantity of chloroform and then covering it with pine tar.

Plant Quarantine Board Meets at Salt Lake City

Use of the quarantine, not as a drastic remedy to be applied after a destructive crop pest has gained a foothold, but rather as the "ounce of prevention" which is "better than the pound of cure," is the idea underlying the formation of the Western Plant Quarantine Board, which held its second annual convention in Salt Lake City, May 11-13. The board was organized at Riverside last year. Harold R. Hagan, Utah crop and pest inspector, is secretary of the board, which held its meetings in the Utah state capitol.

G. H. Hecke, director of the California department of agriculture, chairman of the board, expressed the thought given above in describing its purpose. To J. Rawlins of Draper, chairman of the Utah crop and pest commission, however, Mr. Hecke gave credit for sounding the keynote of the meeting, which was that quarantine work will never reach its full efficiency until it is taken out of politics. Mr. Rawlins said that it takes years to develop a good plant quarantine inspector, and that when one is developed he should be kept on the job and be paid a salary sufficiently attractive for him to remain in public service.

Governor Bamberger made the address of welcome after roll call had shown 14 delegates from the 11 Western states represented on the board. Mr. Hecke then made his annual address in which he called attention to the objects of the board, the work it has accomplished and that which remains for it to do.

Mr. Hagan made a brief report on Utah's quarantine work for the past year, showing that Utah shippers had broken the regulations of other states five times, so far as called to the attention of his office, and three times had shippers into his state broken similar regulations.

Frederick Maskew, chief deputy quarantine officer of the California state department of agriculture, read a paper on terminal inspection of plants shipped by mail, the paper having been prepared by Lee A. Strong of California, who was unable to be present. The paper told of cooperation between California and the post-office department, and urged the adoption of similar measures in other states.

Andrew Kimball of Arizona reported at considerable length and brought up the subject of the pink bollworm and the boll weevil as a menace to California and Arizona, the only large district remaining that can grow the best cotton and is free from these pests. Mr. Kimball was appointed chairman of a committee on cotton seed and cotton, with Arnulfo Liera of Lower California, Mexico, and Frederick Maskew of California as the other members. W. H. Wicks of Idaho reported briefly on quarantine work in that state. O. A. Pratt of the federal service, who has been assigned to Lower California, told of the quarantine work there, and said that that state of Mexico is adopting as strict quarantine rules as any state in the United States.

PRACTICAL EDUCATION IN TRAVEL CLASS

Dr. J. Eliot Coit announces his citriculture class of the University of California in its traveling course will be in Los Angeles County during the next few days.

This course covers the fruit growing industries of the entire state and lasts for six wees. It is participated in by advanced students in agriculture in the university, who travel in automobiles and study the practical side of fruit growing in this way.

The class will spend Saturday, May 29, in the study of the wholesale terminal market, Los Angeles, and the cold storage plant in connection therewith. On Monday, May 31, they will visit the farm adviser's office, chamber of commerce, horticultural interests at the Huntington Estate, Pasadena; state insectary at Alhambra; and on Tuesday, June 1, they will study the purification and use of sewage water for irrigation at the Pasadena city farm, the North Whittier Heights lemon and avocado plantings, certain nurseries at Whittier; Leffingwell Ranch; and the Whedon avocado orchard at Yorba Linda. On Wednesday, June 2, they will visit the California Fruit Growers Exchange.

There are 16 students in the class, 12 men and four women, about half of whom are Californians, the rest being students who have come here from foreign countries, including England China, Argentine, Australia, India and Brazil.

CLAREMONT HORTICULTURAL CLUB

This club will hold its last meeting of the club year at Pomona College Claremont, Saturday, May 29. The annual election of officers and business meeting will occupy the forenoon. In the afternoon at 1:30 the public program will begin with the last of Prof. R. S. Vaile's talks on Fertilizers and Their Conservation. Dr J. G. Biller will speak on Citrus Blast Mrs. J. C. Hazzard will occupy the "Woman's Hour" and Senator Joseph A. Rominger of Long Beach will close with Important Legislation Needed.

BUT BETTER THEN THAN NEVER

Browne: It is never too late to mend.

Towne: But that is no reason why a fellow should wait until he's dead broke.

One man who has been looking around for "cut" prices says he hasn't been able to find one that was even scratched.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Who Pays Baling?

Landiord under written agreement with the tenant agrees to furnish horses, harness, tools, machinery and all seeds. The tenant takes care of the grain and does all the work for one-half of the crops. There is nothing in the agreement as to who is to pay for the threshing and furnishing of sacks for the grain or who is to pay for the baling of the hay and furnishing the wire for baling. Who pays for these items?—Subscriber.

Sufficient is not stated in respect to the contract to determine just what are the rights of the parties. Such a contract between two parties may amount to a lease of the land; such a lease may, according to the terms, vest title to the crops themselves in the tenant or may vest title in the landlord with a llen. The contract may be such that a tenancy in common is created in the crops or it may be construed that the tenant is merely working for an agreed percentage. Each one of these methods of construing the contract would of course have a great influence upon the answer to this question, as such contract creates the relationship. The landlord might be required to furnish all things if he is the owner of the crops. If the tenancy in common is created they might be required to equally bear the expenses, or if the tenant owns the crops, he might be required to bear all expenses. However, another matter enters into this which may be sufficient to give the answer which you request. As a general rule to be applied here, it is shown that the partles who made the contract were both cognizant of the general usage prevailing in a certain community in respect to such matters as the above; they were presumed to have been made in accordance with reference thereto, and such general custom or usage will be read into and made a part of the contract, thus in the case of Corey versus Struve, 16 Cal. App. 318, a case of lease for the growing of sugar beets. There being no clause in the lease in reference to the disposition of the tops, it was held that the general custom prevailing in that locality, that the landlord receive the tops and that such tops were plowed under for fertilizer, would be read into the lease, and made a part thereof, so in this instance, if there is a custom which has been prevailing in your locality in respect to the matter in question which is known to both you and the tenant, it would undoubtedly prevail and be read into the lease as a part thereof, in the absence of a definite agreement contained in the lease itself. If you desire more explicit answer send down the lease itself.

Property in Wife's Name

The title to a ranch is vested in the wife, although the property was acquired subsequent to marriage by joint earnings. Can the wife sell or will the property without consulting the husband? Is his signature to the deed necessary to make it a valid instrument?—Subscriber.

The property being community property, the husband should join in the signature on the deed, and on the assumption that it is community property, upon the wife's death the whole of the property would go to the husband. The fact that the title to the property is in the wife's name raises a presumption of law that it is her separate property, but this presumption can be overcome by evidence in a proper proceeding. This presumption that it is her separate property is however conclusive in favor of purchaser or encumbrancer in good faith and for a valuable consideration.

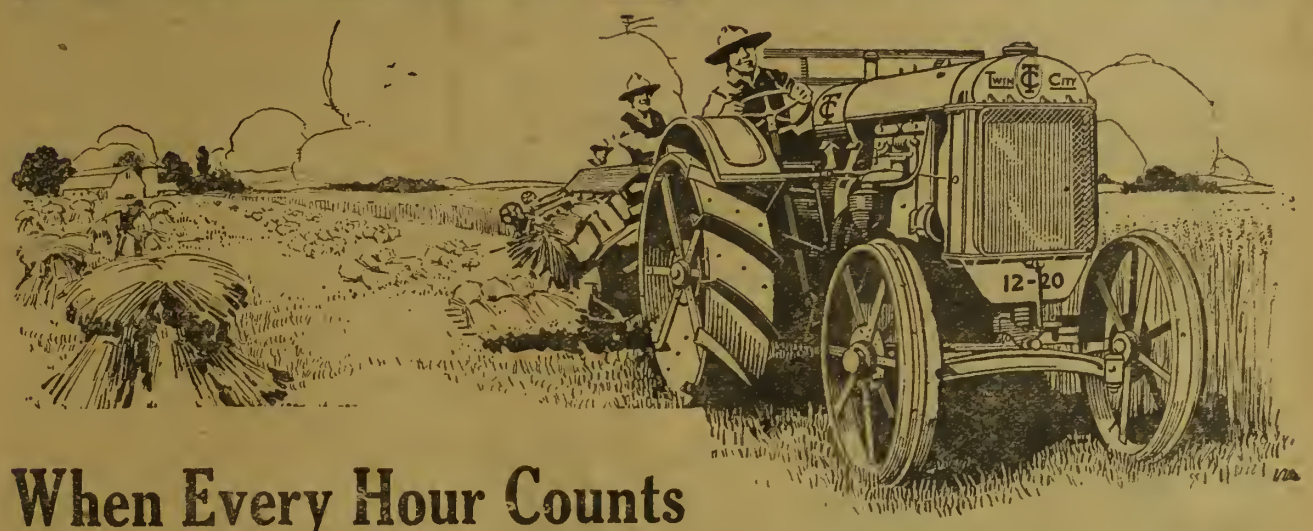
Pipe Line

In 1913 a nelghbor gave me verbal permission to lay a four inch pipe line through his land. Lately I understand that he wishes to make me remove the pipe. Can he do so?—Subscriber, Puente.

The term "verbal agreement" is too indefinite to admit of an answer to such a question. The permission might be a mere license upon which, of course, no claim of right could be based. It is essential in order to establish a prescriptive right that the user be actual, open, notorious and not clandestine; that it be claimed in hostility to the owner of the land and as of right and exclusive of any right of the owner of the land; that it be continuous and uninterrupted for five years prior to the commencement of the action, that is to say, that the water is used through the pipe whenever needed for irrigation purposes. It is sufficient that it be used during the cropping season; and in case the easement should be assessed for taxation separate from the land, that taxes have been paid thereon. This is a matter, however, for the owner of the servient estate to show. If you have acquired a right by prescription you are not required to remove the pipe line. If it is only under a license, then you have not and may be required to remove the pipe line.

TWIN CITY

12-20 Kerosene Tractor with 16-valve engine



When Every Hour Counts

You know there will be no delays in haying, harvesting, threshing, or any tractor work on the farm, when you have the Twin City 12-20. You can clean up all these jobs at the right time—in quick time—and be ready for your fall plowing.

For there are no uncertainties about the Twin City. The best that tractor science has produced is built into this tractor. Its 16-valve (valve-in-head) engine delivers full power because it exhausts *all* burnt gases, leaving a clean cylinder for each new charge. This means more power from the fuel—more power applied to the work—real fuel economy you can see.

With the Twin City's great surplus power you have the rugged strength and light weight which only the finest special alloy heat-treated steels can give. It is built to do the work, not to meet a price. This means dependability year in and year out.

Removable cylinder walls for uniform cooling and quick and easy replacements—crankshaft counterbalanced and drilled for force feed lubrication—all transmission gears of special alloy steel drop forged and heat treated, completely enclosed and running continuously in bath of oil—Hyatt roller bearings throughout.

There is a Twin City of horse power to meet the needs of every size farm: 12-20, 16-30, 25-45, 60-90. All-Steel Twin City Threshers have several exclusive grain saving features: 22-42, 28-48, 36-60. Write for details.

Making Contacts in Marketing Purebred Livestock

By L. B. Burk

THE United States department of agriculture through its bureau of markets has been investigating the various systems and methods of marketing pure bred livestock now in use, with a view to effecting a system of communication among breeders, farmers, county agents, state agents, and state and national livestock associations, which will enable breeders to dispose of their surplus more easily and assist buyers in locating the desired stock close at home.

Breeders of pure bred livestock have felt for a long time that there is a need for a closer acquaintanceship with the livestock farmer who does not breed pure bred animals. The breeder with only a few animals especially, often has difficulty in disposing of his surplus profitably, and the man who never before has purchased pure bred animals frequently needs information relative to the location, value and quality of the animals desired. Such information is of especial importance if it helps him in finding what he wants near at home. Although in many instances the animals offered by the small breeder may lack condition and are inferior, the principal reason for his inability to sell is the fact that he is not a well known breeder, he is not acquainted with the usual methods of selling purebred livestock, and he has not been able to realize the value of advertising.

Since a substantial growing industry depends largely upon the success of a large number of small breeders, it is of vital importance that a reasonable profit from the beginning be realized or they will become dissatisfied and quit the business.

The principal difficulty lies in the inability of the uninformed purchaser to get definite, accurate information regarding the kind of animals to buy and where they can be located most easily. The importance of starting with the right kind is so vital to the success of the business and there is so much misinformation that the purchaser needs advice from a disinterested party in whom he places confidence.

The bureau of markets in cooperation with the various state agricultural colleges, county agents, and local livestock associations, is inaugurating a plan which will assist buyers very materially in obtaining easily the information desired regarding purebred animals. The plan is based upon the cooperation of the breeders within a county or community. The farm bureau or county agent's office is the headquarters for the local cooperative association and usually the county agent is the secretary.

Although many different ways of getting results are employed by the various local associations the principal object in the plan of the bureau of markets is for the association to supply definite detailed information regarding the various herds in the county to those who desire it. This enables the buyer and seller to get together easily in order that a sale may be made, and when this is done the association considers it has accomplished its purpose. It is obvious if the secretary is to direct buyers he must be well acquainted with the breeders and the herds in order to furnish the necessary information readily. Naturally the first step is to make a survey and determine the number of breeding animals in each herd, the number of each sex, the age and quality, and the kind of sire heading the herd, together with the exact location and the approximate number of animals offered for sale each season, this being the information needed. As soon as this information is completed it is filed in a form readily accessible to anyone. By this method fairly complete files may be maintained by collecting such data twice each year and when direct inquiries are made more definite information may be obtained by telephone. The information is then plotted on maps which are placed in conspicuous places where everyone will have an opportunity to see them. In a surprisingly short time every farmer in the county knows where all of the breeders within the county are located. In some states the county agent obtains a list of the number of animals for sale each month and this list is published by the state field agent in marketing and distributed within the state. In counties where this plan has been most successful county agents claim to have done as much as $9,000 worth of pure bred livestock sale business each month.

Where the demand is not great enough to absorb the supply within a county the members of a community use two methods for disposing of the surplus. One is to conduct a consignment sale and sell the animals at auction. The other is to advertise extensively as a pure bred livestock center or county. Both methods have given excellent results. Some communities, however, have made the mistake of selling all of their best animals privately and consigning the culls or less desirable animals to the sale. Such sales are frequently a great disappointment and great care should be taken to offer nothing but high class animals at auction because visitors are sure to judge the quality of a man's herd by the animals he consigns to the sale.

As soon as the survey is completed in a county a copy of the tabulated data is sent to the state field agent in marketing where the data from all of the counties are kept. The object is to enable him to handle inquiries within the state and to furnish buyers the necessary information which is sent in by the various county agents. It enables him to direct men in adjoining counties and those who desire carlots of certain breeds to certain groups of counties which have a very large number of animals.

The state field agents of the bureau of markets, cooperating with the animal husbandry men of the college, work out plans for assisting buyers both within and outside the state in locating the animals needed. They often help county agents find animals for club members, make definite arrangements and plan trips for out-of-state buyers in order that they see the maximum number of animals at the least expense. They also cooperate with breed associations in conducting local auction sales.

Just recently the field agent in marketing and the animal husbandry specialists in Nebraska attracted buyers from Texas who bought 300 pure bred hogs in one lot from four adjoining counties. The fact that these men were assured that they would be shown a thousand high class registered breeding hogs per day in five adjoining counties was one of the strong arguments which caused them to cross some of the other leading livestock states and buy their hogs in Nebraska. The Texas men were extremely well pleased with the service rendered and the breeders were pleased to get the opportunity to make such sale. As the plan becomes well established so that the county agents know where the various herds are located and the kind that are for sale, the foreign buyers will find the services of these county agents of great value in locating the kind of animals they want.

The state field agents in marketing of whom there are 28, transmit a condensed report to the Washington office of the bureau of markets, where it is kept on file for use in directing foreign buyers and buyers in various sections of the United States to districts most accessible to them.

In a recent communication it was learned that a certain party in Central Florida made inquiry for a carload of Herefords in Central Montana approximately 2,500 miles away. It later developed that he could have obtained animals at a very reasonable price, sired by an international grand champion bull, within 150 miles of his home. Had this man bought animals in Montana he would have had an enormous freight bill to pay, the long trip would have been extremely hard on the cattle and it would have been necessary for them to become accustomed to the change in climate and altitude before they would have done well, and it is quite likely the initial cost on the farms would have been the same for the same quality of a

lmals. Although thls is a striking example of the need of the servlce described herein there are hundreds of less striklng but slmilar cases every year ln different sectlons of the United States.

During the past year many breeders have expressed a desire to enter the foreign field, but very few American breeders have been foreign traders ln the past and a large amount of information is necessary before shipments and proper contracts can be made whlch will assure success in the undertaking.

In vlew of this fact the Unlted States department of agrlculture has taken steps to assist ln developlng foreign trade ln pure bred livestock. An attractively illustrated booklet prlnted in both Spanish and Portuguese, showing the types and location of our Amerlcan breeds, together witn the guarantees offered by the United States government against disease, was publlshed and distributed in South America. Detailed personal investigations of conditions in South American countrles and Europe have been made during the past year by representatives of the bureau of markets and now, from time to time, there are buyers from those countrles coming to Washington and requesting assistance. On this account it is necessary that the Washington office of the bureau know what organizations are prepared to handle foreign trade and what state or states can offer most desirable stock, shipping facilities, and detailed service. It is qulte apparent that buyers from South Amerlca need dlrect assistance and it also is lmportant that such assistance be efficient and given promptly without charge. All matters must be handled by partles in whom the seller, as well as the buyer, has confidence. The seller must also appreclate the value of future trade and not place a prohibitive prlce on hls animals if he expects to make a sale.

Business methods in the United States are quite different from those in South Amerlca and all assistance given South American buyers will be greatly appreclated because it will help to reduce the cost of importing animals into thelr country. This, of course, is an important matter since the buyer naturally will purchase his stock from countrles where he can buy the cheapest, other condltions belng equal. Since many of the governments of the South Amerlcan countries subsldize the importation of livestock the breeders and farmers naturally expect the United States government to glve assistance when they come to thls country to buy.

The country livestock association which keeps definite, complete and up-to-date information on file, and makes this fact known to the state field agents ln marketlng and the Washington office of the bureau of markets, will render a much needed service to its members, the livestock industry as a whole, and to foreign buyers who come to this country for pure bred animals to improve their herds.

A Bad Situation

By A. L. Spellmeyer

MORE than 80 millions are invested in California beef cattle and 200 millions in land, a total of almost 300 millions.

It would be well for the people of this great cattle state to wake up and find out that one of its greatest industrles is today being seriously injured. The cattlemen are losing so much money they refuse to stock up and hard winter prospects discourage portions of the state, even though they wlsh to fill to normal numbers.

The cattle association advises withholding of beef. Ten cent steer beef means loss for many, ruin for some; 11 cent beef means breaking even for the majority.; 12 cent beef would mean restocking, fair profits and encouragement of an industry vital to the state and its soil and economic prosperity.

Although prices to cattle producers have dropped ln the last two months from 13 cents to ten and the effort is to drlve it lower, does anyone know of any decrease to consumers? Cattle price declines approximate 25 per cent—and the industry was not profitable before such declines. $36 per head decline on a 1,200 pound steer which should dress 60 per cent, or 720 pounds of beef, means about five cents decline, or some 25 per cent on carcass prices. Where does this money taken from producers go? Surely consumers don't get it and retailers still pay high carcass prices.

Foolish indeed is it to cater or play to public demand for lower living costs by lnjuring an industry so that it cannot operate. For the public and for the certainty of the future it is far better to see vital production secure a living profit, so that future plenty and consequent lower prices may be assured. It assures nothing to wreck the cattle business merely to have the public say the packers are holdlng prices down, and the packers are pointing to their wonderful efforts to lower llving costs in the country, which efforts have been totally at the expense of producers and future cattle production.

A decline of 700,000 beef last year seems small, but remember all the surplus of accumulation from war cold storage, etc., was practically absorbed. Next year cattle will show larger decreases. At present the situation is not dangerous, but it will take five years to bulld the nation's herds to our slaughter needs if we start now, and before that five years the increasing shortage will be a serious matter.

Locally in this state it has stopped all cattle activity, all restocking—and owing to the past three drouthy years supply is already under normal. Cattlemen should wake up. Let them write the association, finance a market committee to meet the issues, follow the beef bought at ten cents or less through to the consumer and make the finding public. Cattle didn't come down in other countrles, and cattle never did rise with other commodities or expense. Lower prices to producers merely mean a loss they cannot stand. If the cow men will get together they can stop the latest gouge. Write the Secretary California Cattlemen's Association, 222 Sharon Building, San Francisco, you cattlemen, and join the association if you don't belong already. We can do what walnut and orange men do.

SANTA BARBARA CATTLEMEN AND FARMERS COOPERATING IN FIRE PREVENTION

Eugene S. Kellogg, secretary of the Santa Barbara County branch of the California Cattlemen's Association, writes that his association and the farm bureau are cooperating in the matter of fire prevention.

The two organizations, cooperating, are installing fire fighting apparatus in each locality in the county for the coming season. This apparatus will consist of 14 two-wheeled trailers, each trailer equipped with six National Standard chemical fire extinguishers, 60 recharges, six three-gallon fire buckets, six shovels and five five-gallon milk cans.

The farm centers in each locality will act as custodians of the apparatus, arranging for fire fighting crews which will familiarize themselves with the operation of the extinguishers and be ready to act on short notice in case of fire.

Bumper crops of grain in the county this year, together with abundant feed on the range, make this equipment essential. To further guard against the possibility of the spread of camp fires along the highway, definite camping sites are now being located at convenient distances along the highway, which will be provided with water and adequately protected by fire breaks. An ordinance will be passed prohibiting persons from building fires along highways at other than the regularly designated camping sites.

KINDRED FEELING.

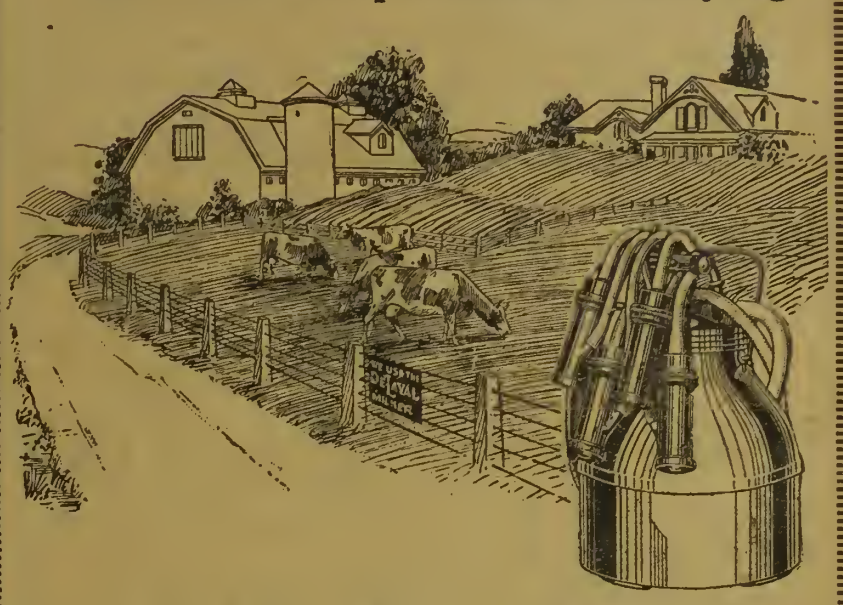
"You say you want no government whatever?" said Mr. Rafferty.

"None whatever," rejoined Mr. Dolan.

"I hope you get your wish for a minute or two, Then I can handle you any way I feel without a chance of your calling a policeman."—Washington Star.

The De Laval Milker

—the road to profitable dairying



A De Laval Milker is a short-cut to profitable dairying, because it makes possible the production of more milk at less cost.

One man with the De Laval Milker can do the work of three hand milkers, and the work is easy and pleasant. Besides, the saving in labor, the gentle and regular process of De Laval milking and the alternate action, cause the cows to give down their milk quickly and freely, which usually means increased production.

The quality of the milk is the highest, because the De Laval Milker is simple and sanitary in construction, and easy to wash and keep clean. It is used on many farms producing certified milk.

The De Laval Milker is a distinctly different type of machine. Its simplicity and durability are insurance against annoying and expensive delays, and repair costs.

The De Laval Company's well-known reputation for service is an additional insurance of lasting satisfaction to users of De Laval Milkers.

Write to nearest De Laval office for Milker Catalog, mentioning number of cows milked

California's Entries in National Sale Honored at Sacramento

CALIFORNIA Holsteins were accorded new distinction last Saturday when the consignment from this state to the National Sale to be held at St. Paul, June 3, 4 and 5, was assemhled in Sacramento. The occasion was taken advantage of by the Rotary Club of the capitol city to stage a parade in honor of the event.

The consignment, headed by the celebrated young son of Tilly Alcartra and Carnation King Sylvia, was loaded on gayly decorated trucks and taken to the steps of the state capitol huilding, where it was greeted by the Sacramento Rotary Club and a large number of spectators. George H. Hecke, state director of agriculture and a member of the club, made an address in which he paid high tribute to the work of the California livestock breeders. Hecke declared he was certain that the time was at hand when a new era in California agriculture was getting under way and that the fame of this state, first as a source of gold, then as a great wheat producing section and later as the world's greatest fruit state, was about to be eclipsed as the home of the world's greatest livestock. And such development was hoth logical and desirable, for in the end a successful system of agriculture depends upon livestock—and the better the livestock in any community, the greater the prosperity of that community. At the close of his remarks, he placed a wreath of green around the neck of the "world's greatest calf," the battery of camera men got into action, and the parade, led by a band, followed a course through the principal streets of Sacramento.

The consignment, which is easily the most valuable and important ever sent from California. consists of 11 head, three hulls and eight females, that are entered in the sale mentioned, which is the classic event of Holstein history.

A. W. Morris and Sons, Woodland, consign the young bull from Tilly Altartra. While less than three months old, this youngster is probably the most talked of calf that the breed has yet produced. Combining as he does the blood of two of the greatest cows in the world, and having for his sire Carnation King Sylvia that sold as calf for $106,000, he is expected to prove the sensation of the sale, and there are many who expect him to top the price paid for his sire. This firm has also sent East the young bull King Korndyke Pontiac Acme, a son of King Korndyke Pontiac 20th, the hull recently sold at auction by W. J. Higdon of Tulare to Burr Farm, Los Angeles, for the Coast record of $12,000. The dam of this youngster is the wonderful young cow Miss Aaggie Acme Burke, with a junior two year old record of 1,034 pounds of butter from 24,388.8 pounds of milk, a world's record for milk. From the same herd and out of Aralia De Kol Acme, a daughter of Sir Aaggie De Kol Mead and out of Aralia De Kol Pontiac Mead, with a record of 932 pounds of butter as a two year old. The seven nearest dams of Miss Aralia De Kol Acme held the world's record average of 1,118.7 pounds butter. The fourth member of the Morris lot is Miss Aralia De Kol Mead, also a daughter of Sir Aaggie De Kol Mead. Her dam is Aralia De Kol Mead 2d, 851 pounds butter as junior two year old, the second highest in the state.

W. J. Higdon contributes the wonderful young cow, Ruby Pierterje of Forest Hill 2d, whose record of 39.74 pounds butter in seven days was the largest reported last year, and whose 30 day record of 162.5 pounds of butter is the highest ever made on the Pacific Coast.

Toyon Farms Association, Los Altos, sent the three year old cow Moxee Johanna Korndyke Piebe, a daughter of Sir Korndyke Ormsby Piebe and out of the 30,000 pound cow Cascade Fleta Johanna; also Princess Jonge Buckeye, with an unreported record for 365 days of 1,051.43 pounds of butter from 27,906.17 pounds of milk.

Bridgford Company, Patterson, contribute the bull King Prilly Segis Pontiac, a son of the noted sire and show bull King Segis Aicartra Prilly, and out of Spring Farm Pontiac Maid 2d, senior champion at the 1919 California state fair and with seven day record as a senior four year old of 35.66 pounds butter. From the same herd has been sent Boweda Alcartra Prilly. This heifer, sired by the Bridgford herd hull, is from the noted 37 pound cow Boweda, that was sold in the 1919 Guaranty Sale for $2,400. The third lot from this herd is the heifer, Rose De Kol Alcartra Abbekerk, sired by King Segis Alcartra Abbekerk. She is from a 30.54 pound four year old.

The J. S. Gibson Company, Williams, will be represented by Roma Princess Alcartra, a granddaughter of Tilly Alcartra. She was sired hy Prince Alcartra Korndyke, and is out of Roma Princess Korndyke. This cow has a 305 day record of 775.3 pounds butter from 17,781.17 pounds milk and a 30 day record of 30.39 pounds.

A very few select Berkshires have recently been installed at the D. J. Bastanchury ranch at La Habra. These are from the noted N. H. Gentry herd at Sedalia, Missouri, and include the young boar Baron Premier 157 and four young sows, all the get of the great Baron Premier.

At Hollow Hill Farm, Colton, is now to be seen one of the young aristocrats of the Guernsey breed, the hull calf whose dam is Imp. Brittleware Mistletoe, with record of 751.4 pounds fat as a four year old. Sire of calf is Effie's King of Hollow Hill.

July, Ortega-Underhill-Rancho, Santa Barbara.
July, Conejo Ranch, Newbury Park.

Poland Chinas

August 21, Merced County Poland China Breeders' Association, Merced.
September 27, Hugh C. Shinn, A. J Elliott and Alex D. McCarty, Tulare.

Diamond Bar is already a name to conjure with in California Duroc circles. The one big fact to be noted at the ranch today is the 125 hrood sow whose spring litters aggregate no less than 1,000 pigs. The selection of these high class hrood sows has required the most exact knowledge and skill As swine superintendent Walter Gatton has made good in securing brood sows that are genuine producers and bred along ultra popular blood lines The Ace of Pathfinders heads the list of sires as one of the top-notch sires of the hreed. Four other recognized great boars of the breed are likewise doing effective service at the ranch. while a number of spring litters are accredited to leading sires of the Corn Belt. Individual merit with the ahility to reproduce is to be the slogan at this hreeding headquarters Fred Lewis, the owner, is doing more than one man's share to hring California into her own as a leading hog growing state of the Union.

The Duroc-Jersey breeders of Glenn County met at the city hall, Willows, May 18, and formed the Glenn County Duroc-Jersey Breeders Association The following officers were elected President, F. H. Hurni, Orland; vice president, C. N. Slocum, Willows; secretary-treasurer, C. D. Bright, Glenn; directors—B. Hollingshead, Orland; S. N. Slocum, Willows; D. F. Small, Willows; J. E. Bogue, Glenn; E. D Conolley, Willows. It was unanimously agreed to give the pig club our full support and offer prizes for the best pigs. A futurity show will be put on at the Glenn County fair in Octoher —C. D. Bright, secretary-treasurer

---

A. E. Harvey of the Fairbanks Ranch, Redlands (Hampshires), has taken a unique stand in the conduct of his hreeding operations His prime requisite in all breeding stock is the very limit of bone and stretch, consistent with quick and easy feeding quality. The great sire Harvey's Choice illustrates this theory. He is a regular 1,000-pounder in show form, and the pigs are like the sire. It should be remembered that the Fairbanks Ranch is the home of many of the greatest show and hrood sows on the Pacific Coast. The younger herd boar, Chong, reserve grand champion at Los Angeles Livestock Show, is accredited with many fine litters of the spring farrow.

One of the great producing Holstein cows of Southern California is Baron Anahelle Lillith, owned at the Jas. J. Jeffries ranch at Burhank. She has done better than 38 pounds in seven days and is now developing into a fine prospect for a long distance record.

Big Profits

If You Will

Raise Guinea Pigs

In order to supply our ever increasing demand for cavies (guinea pigs) for use in hospitals, laboratories, etc., we have opened a California branch. Few industries offer such profit at such slight Investment of money and time. Foundation stock can be purchased for only a few dollars and cost of raising is only about 5 cents per head. We agree in writing to purchase all the cavies you raise from stock purchased from us or their descendants and will pay $1.20 a pair for animals weighing over 8 ounces delivered. Even a few pens should pay you well. Send for booklet about breeding, care and money making opportunities raising cavies. You can get started raising cavies on an investment as low as $5.00.

To Sell To Us

250,000 NEEDED YEARLY

by laboratories and other institutions every year In all parts of the country. Many of these big orders, representing over a million and a half dollars expenditure each year, are waiting for supplies. Waiting for people to wake up to their opportunities and raise sufficient stock to meet their requirements, One institution alone in Pennsylvania requires on an average of 1,500 guinea pigs each week.

We have more orders than we can possibly fill, so we will furnish you breeding stock at small cost.

Guinea pigs are very prolific and at 6 weeks of age are ready for mating. They thrive in any climate and can be successfully raised in congested neighborhoods without annoyance of disagreeable odors, even when kept in large numbers.

This Has Nothing to Do With Vivisection

10 Guinea Pigs should earn $100 a year 500 Guinea Pigs should earn $5000 a year

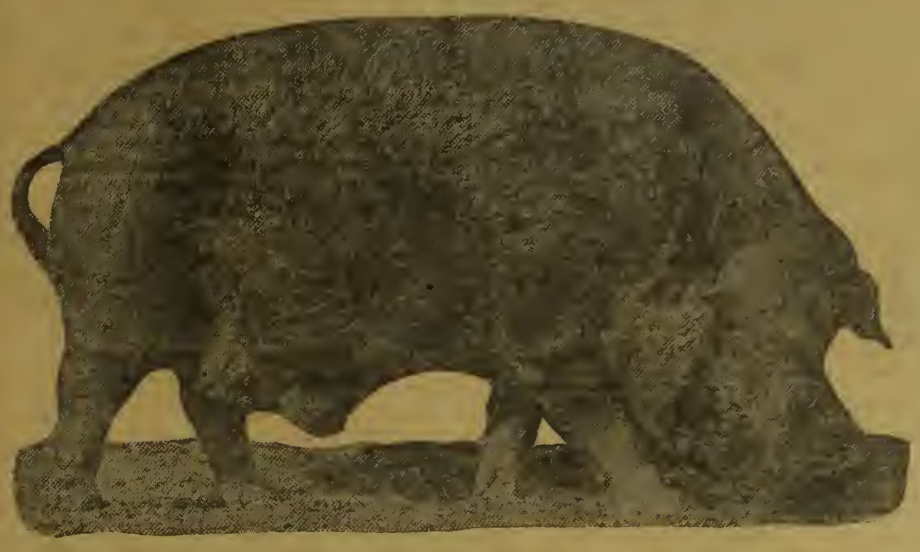
Home of the World's Greatest Durocs



Ace of Pathfinders

The Ace of Pathfinders headed the World's Grand Champion Duroc herd at the 1919 National Swine Show; also the first-prize get-of-sire herd. He was Grand Champion at the Los Angeles Livestock Show, and stood second to the world's champion boar at the National. He is by Pathfinder, out of Hiawatha, by Crimson Prince, and besides his show ring record he is considered one of the greatest sires of the breed, his pigs being the crowning achievement in Duroc breeding.

Other Great Sires Used

The Spring litters at Diamond Bar are also by such eminent sires as Great Sensation, Great Orion Sensation (world's grand champion), Royal Pathfinder (the $20,000 boar), Great Pathfinder, Great I Am, High Pathfinder, Top Orion, Mammoth Sensation Jr., Great Sensation 2nd, California Great Wonder and Orion Reformer.

Splendid Galaxy of Brood Sows

The dam of every pig we offer is either a prize winner herself or the daughter of prize winners, and every one has demonstrated her merits in the breeding herd as well as in the show ring. Our sows are largely of PATHFINDER, GREAT SENSATION, GREAT ORION and BIG BONE GIANT blood lines.

Pigs Must Have Good Mothers Of course you want pigs sired by a noted boar, but do not stop there. Be just as particular about the dam, especially if you are selecting a herd sire. There never was a great man in history who did not have a wonderful mother, nor was there ever a really great boar whose dam was not a very high class brood sow. The better the sow the better the offspring—don't forget that.

Winners and Producers We breed Durocs with a constant view to their ultimate end—the pork barrel. With us the supreme test of greatness is a sow's breeding ability, and if she cannot produce fast growing, easy feeding, profit-producing pigs we must consider her a failure—no matter what her pedigree or show ring record may be.

Can Supply All Needs

No matter whether you are looking for a foundation herd, new blood for an established herd, show animals, or simply boars to put money-making qualities into a grade herd, we can satisfy you. We have the biggest, stretchiest Spring pigs you ever saw—1,000 of them. They represent the utmost in Durocs, and are a great lot of prospects.

While quality is high, our prices are most reasonable. You can't resist them. We will give you the best hog value you ever saw, and our guarantee of satisfaction goes with every animal. Call or write. Correspondence cheerfully answered.

Let us start you on the road to greater prosperity with a few choice pigs. You need this breeding to insure your success. The dollar mark is stamped on every animal. Grow them out and they will make a fortune for you.

BERNSTEIN'S RANCH

Home of King's Big Ben, where he is siring those early developing big type Poland Chinas that are ready for the market at 6 mo. They have size, bone, quality and are from the easy feeding families.

W. Bernstein Hanford, Cal.

Record Crowd---Big Barbecue---Heifer Raffle

These were some of the highlights in the big HAMMOND & BRADLEY CLOSING OUT SALE of high-class dairy cows at the old Fredericks Ranch at Hynes, May 21st. The 77 cows offered were eagerly absorbed by buyers at an average of $145 per head. The young heifer was drawn by an "innocent bystander" under rules and regulations voted on by the crowd. She then went under the hammer at $65.

The New Hammond & Bradley Sales Yards will shortly be announced, meantime keep an eye on the gun for happenings all along the line.

For live wire action in the selling field write, wire or consult

When Writing Advertisers Mention California Cultivator

Tallowy Butter

Complaints are sometimes received at the office of dairy inspection of the state department of agriculture that butter from certain dealers is white and has a tallowy taste. Experiments have shown that this condition is no fault of the manufacturer in many cases. It does not represent an admixture of foreign fats, as has sometimes been hinted, but it is the effect of certain enzymes or ferments which are normally present in butter but whose functions have been diverted.

Placing sour cream in rusty utensils or tin plated copper vessels in which the copper has been exposed by wear results in the production of iron or copper lactate. These salts act as catalytic agents in the presence of certain enzymes and cause them to oxidize the natural pigment or coloring matter of the butter, thereby making it appear white. At the same time certain fat constituents of the butter are also affected and produce the flat flavor and peculiar odor by which such butter is characterized.

It has been further shown that raw cream butter is more prone to develop tallowiness than is butter made from pasteurized cream; also, the temperature at which the butter is stored is a factor—that kept at room temperature develops the condition rather quicker than that kept at a low icebox temperature. It is believed that the use of high temperatures for pasteurization, as high as 80 degrees Centigrade (176 degrees Fahrenheit), will, to a very great extent, destroy the enzymes that bring about the change. Milk cans and other utensils with which milk and cream come in contact should be re-tinned when the plating is worn off.

Sweet Clover Seed Not Injurious

That sweet clover seed screenings are not injurious when fed to stock in proper quantities is the conclusion justified by tests made by the bureau of animal industry, United States department of agriculture. While it is recognized that an unqualified general statement should not be based on a few experiments, the results obtained by a limited number of tests tend to prove there is no ground for the fear entertained by some, that sweet clover seed screenings with hay can be fed to sheep to good advantage though perhaps they do not form as desirable a grain feed as bran. The experiments suggest that a larger use might be made of these screenings as a stock feed.

One of the tests consisted in feeding two sheep with screenings composed largely of immature sweet clover seeds together with a small proportion of other seeds, fairly typical of screenings commonly used. Two other sheep in the same test were fed commercial screenings. The average daily ration per 100 pounds of live weight of sheep at the outset ranged from 1.06 to 1.79 pounds. This was the only feed given to the animals for a week, but the amount was gradually increased from day to day. All of the four sheep in this test lost weight, but this was attributed to the fact that at the beginning of the experiment the rations were insufficient to keep the animals in good condition, granting that sweet clover seed was a good feed. There were no other indications of any injurious effect from this ration.

To determine what bad effects, if any, might follow the use of sweet clover seed in addition to other feed, two sheep were given all the alfalfa hay they could eat and in addition nearly one pound daily of sweet clover screenings for each 100 pounds weight of each animal. One of these sheep increased from 101 to 103 pounds and the other from 100.75 to 109 pounds. Two other sheep were fed in practically the same manner except that instead of sweet clover seed screenings a small quantity of bran was substituted for hay. The weight gains of the two last mentioned animals were not quite so large as the other two, but this was attributed to the smallness of the bran ration.

Further to test the relative value of bran and sweet clover seed screenings as a grain ration, two sheep were given a ration of screenings daily and two others were given a ration amounting to three-fourths of a pound of bran daily. All four of these animals were kept in a pasture during the day and received their respective grain rations at night. All of the sheep remained in good health during the experiment. Those fed sweet clover seed screenings did well so far as this experiment was concerned, although the weights at the end of the test, which lasted approximately six weeks, seemed to indicate that the bran was the better feed.

THE HORSE STILL A USEFUL ANIMAL

As for the draft horse ever being completely eliminated by mechanical power, I am firmly of the opinion that tractors and trucks, useful as they are, important as they undoubtedly are, as factors in our industrial life and development; as essential as they confessedly are in the economic progress of the age in which we live, are no more destined to remove the draft horse from the realm of agricultural production than was the locomotive. It must not be forgotten that Stephenson's "Rocket" frightened for a time the farmers of England into the belief that the steam engine sounded the death knell of horse breeding in Great Britain; but time proved such fears to be absolutely groundless. The railways stimulated British farming operations because they brought about a much closer relationship between producer and consumer, and so with the gasoline and petroleum burning engines that have now come to help knit closer and closer the bonds between the fields, the factories and households of the nation. There is no finish fight on between mechanical and horse power in this year of Our Lord 1920, as some would have us believe. Each supplements the other. Both are necessary and desirable, and both will undoubtedly go forward to new and greater achievements as the country expands in population and production.—Alvin H. Sanders.

AS THE SCOTCH SEE US

The North British Agriculturist has a correspondent in California, a shepherd now on the Butte City Ranch He is John Brims. In a recent issue of the Agriculturist he commented upon California climate as compared with that of Scotland, upon the value of Troneyhill shepherd dogs, and gives to Scotch readers an idea of the method of docking lambs. He writes:

"We have a way of docking lambs at Butte City Ranch that is different from anything I ever saw in Scotland, and I am sure that many of my old friends will be glad to learn of it. Instead of cutting the tail off with a knife, we sear it off with a hot iron. The iron used is made like a wide-bladed, blunt chisel and has a long handle. It is heated in a small stove specially made for the purpose and in which wood is burned. The lamb's tail is pulled through a slot in a board to protect the rear part of the lamb from being scorched, and the tail taken off less than an inch long. Our sheep are registered Shropshires. The hot iron sears the stump, and if the job is not done too fast there is no bleeding at all.

"British breeders will do well to remember that we want the big, useful 'dual-purpose' kind of Shropshire in California."

SUDAN FOR PASTURE

Farmers who do not have silage to supplement the year's supply of feed should plant some crop for solling or pasture, accordlng to S. P. Clark, extension agronomist of the college of agriculture. Many questions are at this time being asked about Sudan grass and Mr. Clark makes the following suggestions:

"It is cheaper to raise young stock on pasture than any other method of feeding. Not only do cattle, hogs and horses thrive better on pasture than on dry feed, but it takes much less time and labor to have the stock harvest their own feed.

"Sudan grass is a crop that has proved itself to be a very satisfactory temporary pasture. Sudan grass in appearance is very similar to Johnson grass. In fact, persons who are not acquainted with the crops have difficulty in telling them apart. Sudan grass is an annual and has to be planted every year. It does not have the objectionable fleshy root stocks that Johnson grass has to carry it over from year to year. Sudan grass stools out quite readily and makes a fair sod, so will withstand the tramping of the animals.

"Sudan grass makes a rapid growth, being ready to cut for hay six weeks from seeding. The growth is renewed after every cutting from stools sent out from the crown and a cutting of hay can be secured every 30 days until frost.

"Because of its ability to renew growth in this manner Sudan grass makes a much better pasture than any of the sorghums. It is very palatable to dairy cows, producing milk of excellent quality and it requires very little grain to balance the ration.

"Sudan requires a firm, well prepared bed and it takes 15 to 20 pounds of seed to plant an acre."

KEEPING THE SILAGE CUTTER BUSY

On practically every farm it is necessary to watch the work carefully when the silo is being filled in order to keep the teams coming to the silage cutter in just the right order. If two teams arrive when only one can unload, one team must stand idle while the other is unloading, and this is an important loss of time.

To avoid this, R. T. Greely of Illinois arranges to have the corn binder cut part of the corn at the near end of the field and part at the far end. In that way it is possible to send some of the wagons to the far end and some to the near end. If the teams seem to be bunching up at the machine, he sends one or two of the empty wagons to the far end, so that they will not come back quite so soon. If there is a delay in getting to the machine, he sends the empty wagons to the near end.

He watches the corn binder, of course, so that it keeps enough cut ahead at each end to keep the work balanced. As a rule, however, it is not necessary to move the corn binder more than once or twice a day. When the binder goes from one end to the other it cuts a row of corn on the way. —System on the Farm.

MEETING OF CALIFORNIA HOLSTEIN-FRIESIAN ASSOCIATION

A regularly called meeting of California Holstein-Friesian Association was held at Tulare on the evening of May 4, at which a number of important matters came up for discussion and action, with something over 40 members present. $150 was voted as a contribution to the general prize fund of the coming California Dairy Cow Competition. After short discussion a resolution was adopted favoring the introduction of a bill at the coming session of the legislature to provide for the cooperation of California with the federal government in the work of eradicating bovine tuberculosis. This work will open the way for federal accredited herds in California. It was voted to hold the next Guaranty Sale at Tulare, provided the new $250,000 hotel at Tulare is completed by that time, the date to be set for some day in the latter part of March, 1921. The president was authorized to appoint a committee of two to arrange a Holstein futurity, based on production records. It was voted to expend the sum of $250 on a float to represent California Holsteins in the big parade to be held at St. Paul, Minnesota, on June 2 preceding the National Sale—C. L. Hughes, secretary.

ARE YOU PAYING FOR A SILO?

If you have a dozen head of cattle or more and do not have silage to feed them you are losing enough money each year to pay for a silo. Many dairymen who now have silos say they paid for themselves the first year by the saving in cost of feed, the increased flow of milk, and the improved condition of the livestock.

Here are ten good reasons why a silo should be on every farm where livestock is kept:

The silo preserves the palatability and succulence of green crops for winter feeding.

It conserves the entire crop.

The silo increases the livestock capacity of the farm.

Silage can be fed in summer when pastures are short.

Silage is relished by dairy and beef cattle and sheep.

It is digestible and aids in the digestion of other feeds fed with it.

Silage reduces the cost of production of milk, beef and mutton.

It will increase the milk flow.

Silage promotes the health of the herd.

The silo provides an economical method for the storage of roughage.—Idaho Experiment Station.

GRAIN FEEDING EXPERIMENT COMPLETED AT UNIVERSITY FARM

That the increase in production secured by heavy grain feeding of cows is not sufficient to pay for the increased cost of the grain ration is the conclusion drawn by F. W. Woll, professor of animal nutrition, from a feeding experiment with cows in the University of California dairy herd.

"The practice of feeding grain to dairy cows varies considerably among California dairymen," said Professor Woll, "some feeding about a pound of grain (concentrates) for every three pounds of milk produced, others only a pound for every five or six pounds of milk. Apparently the experiment now closed corroborates the result obtained in the former two trials, that the increase in production secured by heavy grain feeding is not sufficient to pay for the increased cost of the grain ration."

A bulletin is to be published shortly on the experiments with cows in the university herd.

SOY BEAN BY-PRODUCT VALUABLE SWINE FEED

Soy bean oil meal has been found to be a valuable supplemental feed to corn for swine feeding through tests at the Ohio experiment station. This oil meal is a by-product from Southern mills where the oil has been extracted from soy beans for commercial use.

As a supplement to corn soy bean oil meal was found to be more valuable than linseed oil meal and gives excellent results when fed to pigs on forage in addition to the corn ration. Since these feeds as well as corn are low in ash, salt, ground limestone and ground rock phosphate were kept before the pigs in the tests at the Ohio station.

Pigs fed a ration of corn eight parts by weight and soy bean oil meal one part gained more rapidly and required less feed per unit of gain than those fed ground soy beans as a supplement to corn.

Ground soy beans as a supplement to corn were not entirely satisfactory, as when the pigs were given free choice they failed to eat enough to balance the corn. Their lack of palatableness is believed to be due to the oil content of the beans. When the oil is removed this disadvantage is overcome.

PITY THE POOR HORSE

Humane drivers try to protect horses from insects. Here is a recipe for an inexpensive wash that is very effective: Oil of bay berries, 5 parts; napthalene, 10 parts; ether, 16 parts; methylated spirit, 60 parts. These are common chemicals found at all well stocked drug stores, so there is no difficulty about getting the mixture whenever it is needed.

Answers to Poultry Queries

By Jean A. Koethen

Buttermilk for Chicks

We have recently become subscribers to the Cultivator and I have read therein references to buttermilk for little chicks, but nowhere do I find explained just how it is to be fed. Is it to take the place of water or feed and should they be allowed to drink all they want or only be fed a certain amount?—Mrs. F. N. O., Paso Robles.

Buttermilk is fed in a variety of ways. Some poultrymen put it before the chicks in fountains at the very first before they have had a drink of water, because they say the chicks will learn to drink it more readily than they would if they had water first. In such a case it does not take the place of water but is just given for a day before water is allowed. After this both water and buttermilk are given as long as the buttermilk is fed. Others feed a mash moistened with buttermilk after the first few days. At the Cornell station and some others the chicks are given this moist mash from the start. Buttermilk is so wholesome you can hardly make a mistake no matter how often you feed it nor how much. If you feed the moist mash make it crumbly wet, not sloppy, and feed just what the chicks will clear up in 20 minutes or half an hour.

Marketing Broilers

How old should White Leghorn cockerels be for crate feeding? What weight should they be to bring the best price when finished? What ration and in what amount should they be fed?—Reader, Santa Ana.

The age does not matter so long as the weight is right. Leghorn broilers are generally marketed at from 1¼ to two pounds weight, when they are known as "heavy broilers." If they are kept longer than this they put on weight very slowly. The price is the same whatever they weigh, one and one-half or two pounds. It is just a question of whether or not the additional weight will cost all you get for it. Crate feeding is not very largely practiced by Southern California poultrymen. For the most part the cockerels are kept in small yards until they are ready for market. When they are crate fed the feeding is commenced about two weeks before they are sent to market. If they are kept in such close confinement longer than this they are apt to go off their feed. Whether the cockerels are in crates or in small pens their fattening ration should consist of moist mash. The chief ingredient of this mash is corn meal. The mixture may consist of two parts corn meal to one of middlings and one of ground or rolled oats, or two parts corn meal to one of middlings, or equal parts corn meal, middlings and ground barley, but it should be moistened with sour milk and fed in a trough attached to the front of the crate three times daily. Feed all the birds will clean up in 20 to 30 minutes.

Rolled Oats for Turkeys

Should rolled oats be cooked for little turkeys?—Subscriber, Beaumont.

No, they should be fed dry, either alone or mixed with greens.

Green Cut Bone

Please tell me whether in your opinion the feeding of green cut bone would supply the place of beef scrap in a poultry ration?—Subscriber, Pittsburg.

If you can get green bone regularly and in sufficient quantity, and it is fresh and sweet, there is nothing better. Beef scrap is just a substitute for fresh meat. You would need to feed the green bone as often, I should think, as three times a week, and as much as the hens would eat at one meal, in order to have it take the place of meat in the mash.

Last Eggs Less Fertile?

Is it considered that the last eggs in a clutch are less fertile than those laid earlier?—Subscriber, Pittsburg.

Certainly not, unless the male bird has been removed from the pen. Eggs are fertile from four to six days after matings and remain so as long as the male is with the hens and from four to six days after he is taken away. If the last egg in a clutch is very small, as sometimes happens, it is not suitable for hatching for this reason, and not because it is infertile.

Weak Legs

Will you please tell me what causes leg weakness. Several of our pullets five months old are troubled with it and we are unable to cure them. We feed a laying mash, milo and wheat for scratch, bran mash at noon, and a variety of greens. One-third of the flock are now laying at five months of age. Would you consider that they had been forced?—Subscriber, Escondido,

No, five months is not too young for well bred pullets to lay, especially in the spring. Your ration is very good and not to blame, I feel sure, for the weak legs. Leg weakness in young chicks is usually attributed to too close confinement and consequent lack of exercise and is most quickly cured by putting the chicks on range or at least giving them more room for exercise. Weak legs in nearly full grown pullets have some other cause. I should examine the wheat very carefully. Moldy or musty or diseased or spoiled grain of any sort sometimes produces a disease one of the symptoms of which is great weakness. The birds stand and move with great difficulty, but the trouble is in their lungs and digestive organs, not in their legs.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

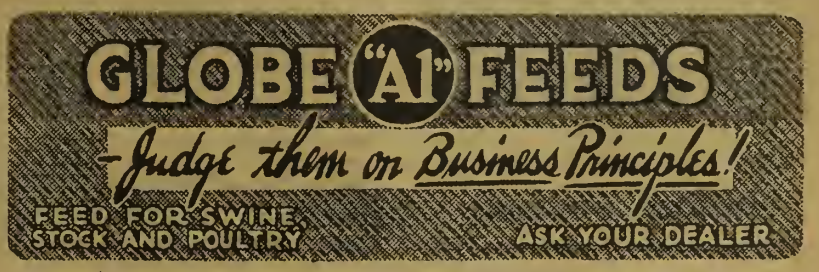
By Max Kortum, Manager

Report for week ending May 8: R. C. Gibson of Newhall took first place for the week with a production of just 80 per cent, or 56 eggs, for his ten hens. The whole flock averaged 66 per cent for the seven days. Up to date three pens have passed the 1,000 egg mark. These are as follows: D. B. Walls, 1,150; Enterprise Ranch, 1,065; B. F. Rose, 1,049; W. J. Neef of Santa Cruz should have been among these, but he had the misfortune of losing one of his good hens, which gave his count a setback of 48 points.

There seems to be a misunderstanding with some of the poultrymen as to how the count is affected when an alternate hen is put in place of a regular hen that dies. The record of a dead hen dies with her and only the eggs that the alternate has to her credit to date are substituted in place of the discarded record. Anyone with a little thought should see that this is the only way that this can be done, but I have been told that the belief of some is that the record of the alternate is added to that of the dead hen. Such a procedure would make a false record.

Following are high pens for the week: Gibson, 54 eggs; Bellows, 54; Gray, 53; Gibson, 52; Stalling, 52; Peck, 52; Barker, 52; Schlink, 51; Enterprise, 50; Pasquale, 50.

Ventura County reports 10,000 acres less in Lima beans than last season.



There's a Player Piano For Every Home

In every home that can afford a Piano there should be a Player of some kind—it will bring so much pleasure and relaxation.

A Player-Piano will help the children with their music—it will give the older folks a greater musical appreciation. And for dancing you can have the jazziest of music.

We offer an unusually large line of Player Pianos—we can easily suit every home and every purse. We carry the famous Aeolian Company line (the Pianola and marvelous Duo Art) offering a most varied line of Player instruments.

Prices cover a wide range, and we gladly arrange convenient payment terms.

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

Dealers in Steinway and Other Pianos, Pianola and Duo Art Pianos, Aeolian Player Pianos, Player Rolls, Etc.

THE DAY OF MEMORY

Bring the flowers, fair and sweet;
Follow close the marching feet
Of the veterans who go,
With their loyal hearts aglow
With the love of men for men,
To their comrades' graves again.

Bring the blossoms, sweet and fair;
Lay them down with love and care
Where the little banners wave
O'er each soldier's sacred grave;
Say a word of grace and prayer
For the hero buried there.

Listen while the chaplain reads
Office for the dead and deeds
Are recounted once again
Of the war stormed hill and plain;
Listen while is called the roll—
Death has taken heavy toll.

Bring the little ones to see
And to listen eagerly;
Dirge and volley, prayer and speech,
Deep into their hearts will reach;
They the rites must carry on
When the veterans all are gone.
—Emma A. Lente in Farm Journal.

MANDY'S MEMORIAL DAY

By John Clair Minot in Youth's Companion

MANDY'S mother took in washing and was as busy on Memorial Day as on other days; but for Mandy herself, after she had wiped and put away the breakfast dishes and carefully swept the kitchen of the little cabin where she and her mother lived, the day was her own to do with as she wished. There was no school, and her mother would not need her until night. So she tied her brightest ribbons to the ends of her kinky little braids and set off down the street to seek adventures.

Mandy often did errands for her mother, and she felt quite at home in any part of the city. She knew that on a holiday like this there would be many wonderful things to enjoy. Certainly there would be bands playing somewhere and men marching, and nothing could be finer than that. In a little while she had left behind the dingy part of the city where she lived, and found herself on a broad avenue that bordered a beautiful park. There the sidewalks were more crowded, and everyone seemed to be waiting for something. Mandy squirmed her way through the crowd until she reached the curbing, and there, in the very front row, she, too, waited.

She did not have to wait long. In a little while she heard music in the distance. It was the band that she had hoped for. It came nearer and nearer, but it was playing a solemn piece in very slow measure, instead of the lively airs that she liked. In front of the band big policemen marched and other men rode on horseback, and behind the band came a long line of soldiers. How she loved the uniforms and all the bright buttons and buckles and rifle barrels that flashed in the sunlight—and the flags that waved over the ranks!

When the flags went by, the men and the boys near Mandy took off their hats. Mandy wore no hat, or she would have felt like doing the same; but her bright eyes grew brighter, and she stood very stralght and saluted the flag with her hand, just as her teacher had taught the class to do during the flag exercises at school.

Next after the soldiers came a long line of automobiles. The first of them were filled with flowers, some in baskets and some fashioned into clusters and wreaths. Old men rode in the automobiles that followed—bent and gray haired men in blue suits, with little ribbons and bronze badges on their breasts, and with wide brimmed black hats on their heads. As they rode slowly past, the people on the sidewalks clapped their hands, and Mandy clapped hers as loud as she could.

Just then the band ceased playing and the procession stopped. Two of the old men stepped from one of the automobiles near Mandy. One of them bore a wreath and the other a cluster of roses. They crossed the avenue and went into the park, and there they placed the flowers on the base of a memorial to Abraham Lincoln. They stood there a moment with their hats in their hands and then walked slowly back through the crowd to their automobile. A young man on horseback, waiting near by, dashed down the avenue. A moment later the band began to play again and the procession moved on.

The crowd thinned out. Some followed the procession, some went in other directions. Mandy heard a man say that the procession was going to the Soldier's Monument in Union Square and then to the cemetery at Holly Hill. That was a long way off, and the band was already so far down the avenue that Mandy could hear it only faintly. The park, with its trees and flowers and its broad stretches of green grass, looked very inviting and she decided to stay there and play a while.

When she passed the Lincoln memorial she could not resist climbing upon the broad step at its base and smelling of the beautiful roses that the old men in blue suits had placed there. Suddenly an idea came to her. She would make a wreath of her own. Surely she ought to have some part in the Memorial Day that the teacher had told the class about only the day before.

In a few moments more she was busy making a wreath of the daisies that dotted the green slope beyond the Lincoln memorial. Other children were playing near by; but Mandy was used to playing alone, so she kept at her task when curiosity drew them to watch her. It was not easy to make a wreath of daisies and grass, even with the help of a twig that she broke from a bush, and Mandy wished very hard that she could use some of the flowers that grew in a bed beside the path; but she knew that she must not touch them. There was a sign that said so, right in the middle of the bed, but the daisies were free to anyone.

After a long time Mandy finished her wreath and carried it over to the monument. Then, just as she placed it beside the beautiful roses, something happened.

"Hello, Snowball!" called a heavy voice behind her. "What are you doing here?"

Mandy jumped so suddenly that she almost snapped the bright ribbons from the kinky braids. "My name's Mandy," she said, "and I've made a wreath for Mr. Lincoln."

"Oh, I see!" said the man, and he smiled in such a friendly fashion that Mandy was not a bit afraid. There was another man with him. Both of them were old men with white hair. On the breasts of their blue suits there were little ribbons and bronze badges and they wore wide brimmed black hats. Mandy knew in an instant that they were the two men who had placed the wreath and the roses there two or three hours before.

"And what do you know about Lincoln?" went on the man, still smiling down at Mandy.

"Oh, I know a lot about him!" answered Mandy promptly, with eyes shining. "He was a good man, and he saved the country in the great war, and he loved the colored people and—"

"Yes, yes, sure enough," said the man. "Lincoln was a good man and a great man, and he did indeed save the nation, and he loved all people North and South, black and white. I don't know of any place where it is more fitting for us to put flowers on Memorial Day than on a memorial to Abraham Lincoln."

And then the other man spoke for the first time. "Somehow I feel," he said, "that Mandy's little daisy wreath is more beautiful than the roses that we left here."

The two men looked hard at each other and nodded. Then they both patted Mandy's head and walked slowly back to the automobile that had been waiting for them.

Mandy watched them ride away, and then she started for her home in the dingy little alley. It was well past noon and she was hungry. As she hurried along the street she thought over what the men had said—the old men who had been soldiers in the war long, long ago, when Abraham Lincoln had saved the nation, and her heart thrilled with a proud feeling that she had really had a part in their Memorial Day, and that their Memorial Day was her Memorial Day.

COERCION

"Don't you think the world owes you a living?"

"Yes," replied Plodding Pete. But the world is a tough old creditor. I find I have to hand it a few wallops with a pick and shovel to convince it."

THIS WEEK'S PATTERNS

A lovely graceful design, 2916, to be developed in white or buff linen or a heavy plain material of similar kind. This style is best suited to a figure of above medium height and the long straight lines will help the rather stout figure.

A pretty checked gingham is shown beside it, 3236. The make-over possibilities of this pattern will at once appeal to the woman whose last year's gingham shrank. Underskirt, collar, vest and belt are of plain material, with flaring bell cuffs of the same.

A school dress, 3222, and a dress-up dress, 2888, with dainty frills of lace are shown for girls from six to 14.

A particularly good slip-on apron and house dress are pictured in 3010 and 3244.

A beautiful little play suit is shown in 3241 developed in striped Devonshire with cuffs, collar, belt and pocket tops of plain contrasting color. A blue with red stripe, trimmed in solid red would be particularly good, for dark blue and red seem to fit in very well with garden play. They don't really care if they do get smudgy and muddy. Then after a trip to the tub and ironing board back they come to their small owner fresh and bright as new. An edging of old fashioned heavy red rickrack finishes collar, cuffs, belt and pockets.

A dainty dress is 3236. The extra fulness in front will appeal to the mother of lusty active legged youngsters who jump and run and need plenty of room to do it in.

The hats shown in 3237 and 2888 are of the very best design.

Now is the time when stocks are being cleared from the shelves to make room for fall goods, and the careful buyer may often find real bargains. The talk of price cutting in ready mades we all hope will really mean something, but look twice at ready mades and don't buy if you can get better material and make it at home for less money. A look over these patterns makes one impatient to pull the sewing machine out of its corner and start it humming.

A hint: Look through your machine drawers or the box where you keep your thread, sewing machine needles, hooks, buttons, snaps, bias binding, braid, belting, etc., and the first time you go to town stock up with these necessities. Oftentimes one is delayed in finishing a much needed garment for lack of these little things.

THE HOMIEST THING

(Continued from Page 875.)

brother. And what blessed hours of rest the old chair has afforded me after the babies were asleep!

Now that they have reached the real live boy romping age, my old chair "plays many parts." It is a truck, a tractor, a locomotive, a bridge, a slide, or whatever the game happens to require, until rescued by mother and placed in dignified state back in its own place by the window. We are now looking forward to little Number Three, and as I sit in the old chair and joyously plan the little wardrobe and other needed things, I am more and more hampered by old H. C. L. Finally I tell myself: "Yes, we must save in every way we can, and though I should dearly love some new furniture and especially a new rocker, this old one will serve to bring up one more baby—and thankful I am to have it."

The homiest thing to me is my old armchair.

MY HOMIEST THING

By M. B., Lancaster

As I went about my work this morning with the Household Editor's question, "What is the homiest thing" in mind, I kept saying to myself, "What shall I call my homiest thing?" I know what it is myself but how shall I put it into words so that others will feel just what I mean. It would probably come under "library" in our editor's suggestion list, but I do not wish to call it so for to most of us library means a stately room, lined from floor to ceiling with beautifully bound books —most delightful but within the reach and memory of the very few. Shall I call it the written word? Hardly, for that excludes the illustrations, an important part of my idea. I think I shall name it the love of literature.

At once I take the homiest thing from the realm of the material to that of mental and spiritual, where, I believe, it belongs. It is just as much the homemaker's province to govern that realm; to provide the atmosphere in which her children shall develop, as it is her duty to see that they have proper food and clothing.

Our children may forget the color scheme of the living room, or whether the window hangings are silk or cotton, but they will always hold the memory of the homey spirit of comfort, rest and affection that fills the room like a benediction when the family gather about the fire in the evening to listen to the inspiring words of some good author.

The love of literature runs like a silver thread through the memory of my own childhood. I never pick up one of the novels of Dickens, Thackery or Hawthorne but I hear my sister's voice reading, and enjoy again the quiet humor and feel the thrill of suspense as the plot thickens. We had such good times at Christmas, but the sweetest memory is that of my father reading the beautiful story from Matthew.

We were a large family, each of strong individuality, but the love of reading formed ever a bond of sympathy. There is not one of that now so far separated group but can read aloud smoothly and pleasingly and not one but finds the truest recreation and inspiration in good books and magazines. Can a home give greater gifts to its members?

My own small son will, I know, have the big dictionary that went to school with mother among his earliest memories. From the page of precious stones he learned to distinguish and name colors, from that of wild flowers to love and watch for the prototype of the pictures, and from the page of flags he got the first idea of nations and their emblems. Those pages may be a little frayed but they have served a good purpose. There is too a little leather bound "Longfellow" that I am sure he will always cherish for from its pages he heard the "Song of Hiawatha" and repeated its musical phrases before he could pronounce the words plainly.

Friends of the Household, I believe we can give our children nothing more precious than a love of literature. I believe that nothing will do more to make the home a wonderful place of growth and inspiration than an atmosphere of communion with the best in the great world of letters. In a sense it does away with the limitations of time and space and makes of our children heirs in the wisdom of the ages and leads them to become citizens of the universe.

THE HOMEY THINGS

By Mrs. S. J. Korf, Napa.

The homey things of our home are undoubtedly our musical instruments. When our oldest daughter was in her early teens she never tired of the piano, and we never tired of listening to her playing. Often in the evening we would all join in some good songs, sometimes the Sunday school hymns, and during the war it was usually the war songs.

While our oldest son was in the navy he played the clarionet in the band, and when he would get home, what a good time the young folks would have with their music, practicing their new pieces together, and quite often some of the navy boys from Mare Island would come over and spend the evening with us (we lived at Vallejo during the war), and the evenings were always spent singing and playing the new songs.

And if the young folks did not happen to be using the piano, Papa would slip over to the piano and play some good old tune, such as "Pull for the Shore, Sailor, Pull for the Shore," or "When You and I Were Young, Maggie," or "Old Kentucky Home." And the neighbors would come in and such a chorus we would have.

So of all the home charms, there is nothing that we prize so highly as our musical instruments and pleasures in the home with them.

(More interesting letters will be published next week, describing "The Homiest Thing" in other households.)

Booklets---about Furniture and Home Furnishing---You Should Read!

Barker Bros. will send them to you FREE if you ask for them on the coupon below. Check on the coupon the ones you want, clip and attach the coupon to a piece of paper on which your name is plainly written and the Booklets you ask for will be sent promptly.

BEANS

300 cars limas sold by association at $10.43, f. o. b. Oxnard. See further comment Report on Lima Bean Market by Manager Churchill, of California Lima Bean Growers Association, on this page.

HAY

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	24.00@26.00
Barley	18.00@20.00
Alfalfa	23.00@27.00
Barley Straw	8.00@10.00

Alfalfa Growers of California, under date of May 26, say:

The principal feature on the alfalfa market is the serious shortage in market centers because practically no cars are to be had. The small supply now reaching the market is entirely due to auto trucking. This limited supply meets with keen demand, and market is materially stronger. Los Angeles prices as named this week:

Choice alfalfa	36.00@38.00
No. 1 Dairy	33.00@35.00
Standard Dairy	30.00@32.00
Stock Alfalfa	25.00@29.00

GRAIN AND FEEDS

Price bid local grain exch. cwt., May 25

Barley: 2.80@3.02½.
Corn: 3.86¼@3.90.
Milo: 2.80; Eastern, 2.75.
Eastern Kafir: No. 3, 2.85.

San Francisco Markets

San Francisco, May 25, 1920.

BUTTER

Quotations made daily by the San Francisco Wholesale Dairy Produce Exchange. These are the prices paid by retail grocers to wholesalers. The prices paid by the wholesalers to producers are eight per cent less.

Peppers: Fla., 40@50 large; 10@15 small.

Peas: lb., green, 3½@4½.

Itadish, 7@9 doz. bunches.

Make Fruit Picking Cheaper and Easier

Look at the illustration and study the construction of the **Short Turn Cross-reach Orchard and Vineyard Truck.** It will appeal to any one who has ever handled fruit at the trees or vines. Nothing could be more serviceable or easily handled in a California orchard or vineyard.

This truck is built light, but strong and serviceable. Instead of a coupling pole or reach, two ¾ inch rods or cross reaches connect the front and rear axles, making it possible with turn tables front and rear, to turn in just one-half the space necessary with a straight reach.

The rear wheels follow exactly the same track as the front wheels. It will turn in a four foot radius. Owner makes frame and bed to suit himself.

Everything about this truck is just as good as the cross reach feature. It is a low priced, labor saving device that should be owned by every orchardist and grape grower. Wheels 24 inches high, 5 in. grooved tires. Axles 49 inches long over all.

Dealers will find it in ready demand in fruit districts.

HOW to Kill SCALE and Control RED SPIDER During the Summer Months

What are you doing to stop the ravages of the Black Scale, Citricola Scale and Red Spider in your valuable Citrus grove?

These pests are well known to every citrus grower. They are numerous and all too plentiful. Scale hatches ALL THE YEAR. Soon after hatching it feeds on the tree, taking the vitality that is needed for crop and growth. Scale multiplies with great rapidity. After it feeds it attaches itself to the tree AND NOTHING TRIED SO FAR KILLS IT IN THIS STATE.

Fumigation which, applied for fifty minutes once a year will kill the newly hatched scale while being applied, but what about the unhatched scale? IT TAKES an INSECTICIDE applied after the rainy season, thoroughly covering all the tree and remaining on the tree, ready for any scale that touches it at any time, TO KEEP THE YOUNG SCALE KILLED.

THAT IS WHAT TIZIT SPRAY WILL DO. And it will do more. It controls Red Spider. And TIZIT stimulates the tree—cleans it—and helps it to function properly. You don't have to take our word for this—these things are attested by a great number of the CLEANIEST, BEST PAYING GROVES IN THE CITRUS DISTRICT.

LARGER CROPS, BETTER FRUIT, HEALTHIER TREES and a killing out of the scale—these are proven facts by demonstration one season after another where TIZIT SPRAY IS USED.

TIZIT SPRAY is made under the personal supervision of Mr. John Bacigalupi, who has had sole charge of its manufacture since 1914. The trade mark T-I-Z-I-T is registered. It is not an oil base spray and it contains nothing that can harm the tree. TIZIT is put up in 200 pound barrels and sells for only Twenty-five Cents per pound f. o. b. Los Angeles.

To use, mix in the proportion of five pounds of TIZIT to one hundred gallons of water. Spraying with TIZIT is an exceedingly cheap form of crop insurance.

Why not kill your Scale, control Red Spider and clean up fungus All Summer with TIZIT SPRAY when you can do it so easily, cheaply and surely. Examine your trees carefully now for spider and scale. If any are found it means a reduction of your crop and damage to your trees unless the pests are fought and eradicated. Feed them TIZIT and don't worry.

Write us and we will tell you of the grove nearest to you where you can see what TIZIT has done. Free pamphlet on request, ask for it.

Golden State Buds, 34.
1918 No. 1 price was 28; fancy budded. 31½.

RICE

The domestic market is unchanged, with very little activity. Fancy California Japan, prompt or June, 10.50; July 10.60. Choice is 25 cents less.

BEANS

California Bean Growers Association, San Francisco:
The bean market has shown considerable activity during the past two weeks, particularly for California Large and Small Whites and Pinks. For the past few days, however, owing to car shortage and railroad strike conditions which are still an important factor in the East, there has been a slight easing up in orders on account of the difficulty in securing transportation. The market is firm, with an upward tendency, the following prices being quoted at this date:

Large Whites	6.50@ 6.70
Small Whites	6.10@ 6.35
Mexican Reds	9.40@ 9.50
Red Kidneys	14.00@14.50
Bayos	10.40@10.60
Pinks	6.60@ 6.80
Cranberries	6.50@ 6.75

HOPS

1919 crop, 1.00@1.05 per lb. Prices to growers for 1920 crop, 75@80 per lb.

HONEY

Extracted, jobbing price: Water white, 22; per lb. for sage and 20 for white clover; light amber, 18; amber, 16; comb, 28@30 for water white; light amber, 26@28; amber, 25.

GRAIN

Wheat: The prices are based upon Federal grades and standards at the terminals in San Francisco bay and Los Angeles and are as follows per bushel of 60 pounds:

Hard White—	Per Bus.	Per Cen.
No. 1	$2.20	$3.63 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.13	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51½
Club and Sonora—		
No. 1	$2.16	$3.60
No. 2	2.13	3.58
No. 3	2.00	3.48 1-3

The above are minimum prices.
For sacked grain add 4½ cents per bushel to the above prices. Deduction of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.
Oats: Red feed, 3.40@3.50.
Corn: California yellow, 3.70@3.75 per cental; Egyptian white, 4.10@4.25; California milo maize, 3.45@3.50; Eastern milo maize, 3.15@3.25.
Barley: No. 1 feed, 3.40@3.50.

HAY

We quote today wholesale prices in carload lots (old crop) as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.)

Fancy wheat hay (light 5 wire bales)	38.00@41.00
No. 1 Wheat and Wheat and Oat hay	35.00@38.00

HONEY PRODUCERS

C. E. Millspaugh, one of the best known men in the bee industry has been appointed general manager of the Honey Producers' Cooperative Exchange. Mr. Millspaugh will bring to his work as general manager of the organization a strong influence for a spirit of unity.

The obtaining of markets has been accomplished by organizations having to do with citrus fruits, raisins, nuts and other products. The honey producers are now expected to secure similar strength of position. California produces annually a greater volume of honey than any other state in the Union.

Mr. Millspaugh has had 18 years experience with honey producers, and is recognized as a marketing authority.

Increased Yields of Alfalfa
Follow Applications of

With alfalfa selling around $35.00 per ton, every alfalfa grower is interested in producing a big crop at minimum expense. Numerous experiments by authorized Experiment Stations, County Farm Advisers and individuals have proven conclusively that yields of alfalfa are greatly increased by the use of Gypsum; in fact, the increase in yield is so great as to be almost unbelievable for the small expense and little trouble incurred.

The reason is perfectly simple. Alfalfa requires sulphur and sulphur is most easily and economically obtained in AGRI GYPSUM. Feed sulphur to alfalfa and the plants grow larger, more rapidly and of finer quality. There is abundant proof on record to convince the most pessimistic of this fact. Bulletin No. 163 of the Oregon experiment station containing results of various experiments, tells of greatly increased yields of alfalfa in the soils of California, Oregon and Idaho, **where sulphur was applied in some form.**

In the Palouse hills of Eastern Washington, H. H. Curtis, who owns a large dairy farm near Pullman, has more than doubled the total yield of alfalfa on his farm by the use of Gypsum.

Think what it would mean in dollars to YOU to double YOUR alfalfa yield at as little expense as did this well informed alfalfa grower.

Would you be interested in an investment of say $4 or $5 per acre for AGRI GYPSUM if you thought you might double the yield of your alfalfa crop?

The County Farm Adviser of Mendocino County, California, is reported to have secured increased yields of alfalfa ranging from 11 to 60 per cent, by the use of applications of sulphur. **AGRI GYPSUM** contains the sulphur your alfalfa needs. Put it on your alfalfa and turn a fair crop into a big one, a few dollars worth of **AGRI GYPSUM** into many dollars worth of hay. **AGRI GYPSUM** is made by the largest producer of Gypsum in the world—near at hand, affording minimum freight rates, and good business judgment suggests that you use it now.

Other crops that are greatly benefitted by the application of **AGRI GYPSUM** include beets, beans, peas, potatoes, cantaloupes, cotton, cabbage, cauliflower, vetch, melilotus, peanuts, barley, citrus fruits, deciduous fruits and milo.

AGRI GYPSUM Will Reclaim Alkali Soil

It is a matter of official record that alkali soils may be reclaimed and made to produce splendid valuable crops by the application of **AGRI GYPSUM.** If in doubt about this, write for proofs and our authority for statements made in our advertising.

Ask your dealer for **AGRI GYPSUM** and you will be sure of the product ground fine to do the most good with the least amount used.

If your dealer cannot supply you write

MAN BORN OF A WOMAN-HAS BUT A SHORT TIME TO LIVE.
LIFE IS LIKE A BUBBLE-WE MIGHT SAY A SIEVE,
HE SPENDS A LOT O TIME WITH EXPERIMENTS WE KNOW,
NOW HORSE SHOE TIRES WILL SAVE HIM, TIME MONEY AND DOUGH!
For a long hard run-use Horse Shoe Tires

You never get more out of your Tire than the Maker put in

STAND on a street corner some day and watch the motor cars go by. Every now and then you will see a motorist with two or three tires strapped on the back of his car, each tire of a different make.

A man afraid of his tires.

* * *

No matter how many precautions a man may take he will never get out of a tire *more* than the maker put into it.

If a tire is built to go a *limited number of miles* there is no reason why it should be expected to go any farther.

When it breaks down before it has gone the limit, there is no reason why an allowance should not be made to the buyer.

The car in the foreground has a wheel out of line.

Few motorists realize that a displacement of only one degree has the same effect on a tire as if it was dragged 92½ feet in every mile.

New tires have been known to be completely stripped of their treads in 100 miles of running under such conditions.

What intelligent buyers are looking for is *better tires*—not limited-mileage tires or conciliatory allowances.

And they are beginning to look behind tires to the *principles* on which they are built and sold.

* * *

Here is the principle which governs the production and sale of U. S. Tires: Build a tire as good as human skill can build it, and let *responsibility for quality* exceed every other consideration.

Seek out the new kind of tire dealer—the man who believes in quality and square dealing, who is putting the tire business on as sound a basis as any other retail business in his town.

Back of him stands every resource and facility of the United States Rubber Company—the oldest and largest rubber organization in the world.

U.S. Tires are built on a *quality* basis as fast as quality conditions will permit—*and no faster.*

And they are guaranteed free from defects in materials and workmanship for the life of the tire—*with no limitation of mileage.*

Turning Culls Into Gold

THE packers saved all but the squeal; the lemon growers are turning the culls of their orchards into citric acid. Touch your tongue to a crystal and you will see wherein the greater economy is shown by the California growers.

Up against the foothills east and south of Corona, back from the main highway where the tourist seldom ventures—and thereby misses a bit of wonderful California scenery—is placed a little factory, illustration of which appears here. We say "factory" though it is one of the side lines of a great lemon orchard. The El Cerrito Ranch grows some of California's finest lemons; it also grows those which are not of the finest and, jealous of its own reputation, determined that these, which are not the finest, should be withheld from the packing box and from the eastern consumer, at least in the form of lemons. The growing of lemons is too expensive to "dump them in the wash," hence they must be turned into a product more attractive and still command for the growing end of the orchard something of a profit because of their disposal.

The United States uses large quantities of citric acid. From it may be made cooling drinks, and it has an extended use in medicines, all of us being acquainted with citrate of magnesia and other attractive combinations. In the arts its larger and more general use is by the calico printer. For years we have saved of our wastes in marmalades, in jellies, in bottled juices and in citrate of lime, but this demand has been too limited, hence this citric acid factory.

It has a capacity of five tons of lemons per hour; it is running 24 hours per day. The lemons, if from outside of El Cerrito Ranch, come in flat cars, are handled with scoops on endless carrier to crusher and press and the juice drains away to large tanks, where, after a series of acidulating, neutralizing, separating, filtering, granulating, crystalizing, refining, and barreling, it is ready for shipping. A ton of lemons will yield approximately 50 pounds of citric acid, in addition, 15 pounds of lemon oil. This 15 pounds, however, will soon be greatly increased by improved equipment. An important side line of this industry is the use of the wastes. For instance, gypsum results from the process by adding sulphuric acid to the citrate of lime. This gypsum, almost an ultramarine blue, is now being used in the orchards of the El Cerrito Ranch.

The plant is under the superintendence of E. T. Brink, with Dr. Doell in charge of the laboratory.

Only the merest hint of the process or of the economic side of this plant, but we hope sufficient to attract more attention to the wastes which we should be saving.

Citric Acid Plant of the United Chemical Company on El Cerrito Rancho, Near Corona, Riverside County

THE FIRST cord tire made in America was a Goodrich.
Goodrich still makes the first cord tire in America—

A Few Sugar Saving Suggestions

By W. V. Cruess, Before Housewives League, San Francisco

THE first question to ask is "How much sugar do we need to satisfy the requirements of the body?" We consume on the average in America about 90 to 100 pounds of sugar per capita. This entire amount can be replaced completely with starchy foods. No sugar is absolutely necessary, but our appetites have been pampered by highly seasoned and sweet foods to such an extent that sugarless meals are decidedly unpleasant. Therefore, although theoretically we need no sugar to maintain ourselves at full efficiency, we practically must have at least a small amount of sugar to satisfy the cravings of our "sweet tooth."

Sugar is used in the body as a source of energy; in other words, as a "quick fuel," if used in small or moderate amounts. When eaten in excess it tends to ferment and cause digestive disturbances. The average person may eat safely not more than about four tablespoons of sugar per day, according to Professor Mary E. Robinson of Missouri University. Those who work hard at manual labor or athletes or others who indulge in violent exercise may eat a larger amount; children, less. There is a grave danger involved in giving children too much sugar, especially in the form of candy, in that this may lead to a dulling of the appetite for other foods, with a consequent improper balancing of the diet, leading to improper nutrition or retarded growth.

During the war we saved on sugar because it was a patriotic duty. No such patriotic urge now exists—practically all action now must be taken in the interests of our pocketbooks.

Saving in sugar can be accomplished in two general ways: First, by using less, and, second, by using suitable substitutes wherever possible. The following suggestions are based on one or both of these ways. They can be followed without hardship and are in some cases preferable to the more usual methods.

Canning Fruit

All fruit which is agreeable to eat fresh without sugar is also agreeable to eat when canned without sugar. This applies to most fruits when they are thoroughly ripe.

We do not eat a peach or an apricot with pleasure until it is perfectly ripe, juicy and sweet. If canned when it reaches this condition it is excellent without sugar and much superior to imperfectly ripe fruit canned with any amount of sugar. By allowing the fruit to become dead ripe before canning, it gains in flavor, texture and sweetness. Sugar is absolutely unnecessary for its preservation. It will keep equally well without.

It is difficult for canneries to make use of this principle, owing to difficulties of transporting and handling perfectly ripe fruit and to an acquired public taste which insists more on the preservation of the form of the fruit and the clearness of the liquid than on flavor or nutritive value. Where it is possible to take the fruit directly from the tree to the kitchen, as in many cases of home canning, it can be used dead ripe with great advantage even in normal times.

A few fruits, such as freestone peaches, are best canned as soon as possible after harvesting. Most fruits, such as apricots, pears, apples and berries, improve in flavor, texture and sweetness if stored a day or two, or in some cases longer, in a moderately cool, dry place before canning.

Canning Without Sugar

When fruit is canned in the ordinary way it is surrounded in the can with a liquid consisting of water, sugar and the juice of the fruit. The amount of sugar used depends on the acidity of the fruit and the taste of the consumer. It may, in many cases, be omitted in whole or in part, especially if care is taken in diminishing the amount of water used as much as possible. The following method is recommended:

The fruit is sorted, washed, peeled, pitted, or otherwise prepared as in ordinary home canning. It is then placed in a pot on the stove with a little water to prevent scorching. The amount of water added will vary with the fruit to be canned, firm fruits requiring more than berries or soft fruits. Heat slowly to boiling, stirring occasionally to present sticking and scorching. Allow to simmer until the fruit has sent out sufficient juice to cover it. For berries and very soft fruits the time of boiling will be about three to five minutes, and for firm fruits, about five to ten minutes. While the fruit is being prepared, heat jars, rubbers and covers in boiling water. A large dishpan is convenient for this purpose. Ladle the hot fruit through a funnel into the hot jars and add enough of the hot juice to cover the fruit and to fill the jars completely. Any juice that is left over may be used with the next lot of fresh fruit instead of water. Place the rubbers and caps on the jars in position but do not screw or clamp down tight. Leave the caps on the jars loose enough for the escape of steam during the sterilization process. Place the jars on a false wooden or wire screen

Concerning Our College of Agriculture

By R. P. Royce

CALIFORNIA faces an unfortunate condition as regards its agricultural college and it begins to appear that the time is at hand when some sort of a move must be considered looking toward placing that institution on a more efficient basis. As is known by all, the college of agriculture is a department of the University of California and has existed as such since its organization many years ago. The headquarters of the institution has always remained on the campus at Berkeley and until 1905 practically all of the activities of the college were centered at Berkeley. Always without adequate equipment, the old "cow college," as it was termed, managed to get along in some way or another. The California college of agriculture was not much different in the nineties from similar institutions in other states. It wasn't taken seriously, not much was expected of it and consequently its actual accomplishments were of minor importance. The same situation prevailed in other states to a large extent. However, when there came a general awakening to the possibilities of agricultural investigation and instruction, and the leading states began to develop their agricultural colleges, California faced this proposition: There was no available or suitable land adjacent to Berkeley—the hills were rather more picturesque than practical. And in the course of the rapid development of agricultural colleges, California was so handicapped that we fell almost hopelessly behind.

The type of instruction given the students was almost entirely lectures. There were no facilities for acquainting the students with the more practical side of the work—soil investigations, crop experiments, livestock management and the other important phases of the work were not possible. The institution turned out a "book farmer" par excellence.

That such a situation could not be permitted to continue for all time was certain. It was recognized that there must be some way to provide the necessary land, for surely the place to teach agriculture was and is on the land. Finally, in 1905, a change was made. A tract of land, now known as the university farm school, was organized. It is not too much to say that much of our real progress made in agricultural development dates from the establishment of the university farm.

It is not our intention to in any way question the accomplishments of the college of agriculture or the university farm school, but the points we wish to raise are these:

Has the most been made of the opportunities afforded by the university farm for the development of an efficient institution for agricultural instruction and investigation?

Is the University of California graduating men as well trained as are institutions of similar character in other states?

Is it advisable to consider a complete reorganization of the college of agriculture in order that the entire department can be headquartered at Davis rather than at Berkeley?

(Continued on Page 920.)

A LETTER FROM A GRADUATE OF U. C.

Editor California Cultivator: I have just finished reading an article (in California Cultivator, May 1, Page 730) written by R. P. Royce relative to the University Farm Picnic and also to the college of agriculture. As a graduate of the division of animal husbandry, college of agriculture, University of California, his comment on the work of that division in particular, was of interest.

Probably the general public interested in the work of the college of agriculture does not know under what tremendous difficulties the division of animal husbandry has been and is working. Without facilities to demonstrate to the student and stockmen the relation between stock and the farm or why livestock is essential to the best development and continued use of farm lands, with a constant diminishing staff of instructors, with a divided system of instruction and management, part of the university work being given at Berkeley and part at the university farm, Davis, the situation is discouraging, to say the least. To turn out efficient graduates in animal husbandry, men who can compete with graduates of similar institutions, is impossible under the existing conditions.

The prospective graduate of the college of agriculture in the animal husbandry division, under present conditions, does not have the opportunity of seeing or working with a live animal in connection with the animal husbandry work until the last half of the third year in the college. The next opportunity, and sad to say, the last opportunity for contact with the livestock, is the last half of the fourth year.

An illustration of the result of this system, or lack of practical training, is shown by the recent livestock judging contest held at the university farm. The University of California men numbered about half of the men entered in the contest. In the final judging of the stock the first four highest scores were won by university farm school men and not by the college men. In a recent lecture one of the animal husbandry professors stated that the ability to judge stock correctly was 75 per cent of the necessary qualification for a successful breeder of livestock.

The animal husbandry student of the college of agriculture under present conditions cannot expect to compete on the same plane with graduates of similar institutions of the Middle West. As Mr. Royce states, the college of agriculture, and especially the animal husbandry division, is facing a critical period. In justice to the taxpayers of the state, to the livestock interests and especially to the students themselves, the condition should be changed. This change means, for one thing, giving the student of animal husbandry more contact with animals, which means, four years at the farm.—W. P. Wing, U. C.'20.

Agricultural News Notes of the Pacific Coast

Northern California

University farm school will hold entry tetsts June 15.

One car of cherries from Lodi sold in Chicago for $7,388.50.

Airplane patrol of the Sequoia national forest began May 15.

San Francisco receives from 80,000 to 100,000 dozen eggs daily.

Foul brood is reported in many of the apiaries of Sutter County.

Sonoma County farm bureau will take charge of the coming county fair.

Del Norte County fishermen report: "Salmon are now running in the Klamath River."

Poultry feeding demonstrations are being conducted by Alameda County farm bureau.

Pear blight was the topic discussed at the recent meeting of pear growers of Lake County.

County horticultural commissioners are meeting in state convention in Sacramento this week.

San Francisco weather bureau reports cooler and more backward May weather than for years.

Sperry Flour Company has entered the rice growing industry and has made large plantings in Butte County.

Richvale and Gridley, Butte County, farmers stand to lose immense sums because of disputes over irrigation water.

Pumping plants, automobiles, trucks and other users of gasoline are inconvenienced by gas shortage over all the valley.

A number of agricultural students from the college of agriculture recently visited fruit producing sections of Butte County.

Recent meeting of grape growers in San Francisco resulted in unanimous decision to go ahead with grape growers organization.

Prof. Miles B. Kennedy, formerly with the University of Nevada, is now dairy chemist with the California department of agriculture.

Irrigators at Colfax, Placer County, report melting snows are sending down much more liberal supply of water than was anticipated.

Fruit Growers of California, Inc., has fixed prices for canning cherries: Royal Anns, 11½ cents; Tartarians and Republicans, nine cents.

The Glenn County farm bureau lumber department now has 40 men employed getting out timber, sawing about 10,000 feet of lumber daily.

Oroville canneries announce they will pack no peaches this season—decision due to high cost of sugar. Figs and grapes will be the principal fruit canned.

In the gas shortage which is very stringent in all sections of the Sacramento Valley, "Farmers First" is the motto which governs, especially where irrigation plants are involved.

Auburn, Placer County, recently sent a delegation in connection with Sacramento County Auto Trades Association to clear the snow from highways over the summit to open roads to Truckee.

Sonoma County farm bureau, under direction of Adviser Weinland, is laying out a big year's work along line of cooperation, extension of good roads and better general farming methods.

Central California

Monterey County farm bureau is conducting an employment office.

Farm bureau committee held a fat hog auction at Poplar, Tulare County, May 28.

Corralitos, Santa Cruz County, fruit growers are constructing a dehydrating plant.

Apricot growers report actual sales of canning fruit ranging from $70 to $110 per ton.

The capacity of the creamery at Oakdale, Stanislaus County, has been nearly doubled.

The University of California citriculture class visited Tulare County citrus groves last week.

While Kings River is now flowing about 1,800 second-feet, the water has not yet reached Tulare Lake.

Several towns in San Joaquin Valley have placed an absolute ban on all bonfires during water shortage.

Pajaro Valley apple growers are holding meetings and encouraging enthusiastic support for better inspection.

Lodi grape growers are already considering ways and means of overcoming the car shortage in shipping table grapes.

Top prices at fat hog auction held recently in Turlock were $15; in Le Grand, $15.35; Madera, $15.75; Fresno, $16.30.

Agents of the California Peach Growers, Inc., are busy signing up contracts with members for the coming peach crop.

San Jose reports: "The canning prospects for the season are growing brighter every day. Old pack moving off rapidly."

Tulare board of trade reports production of that county's livestock industry as nearly double the combined value of fruit and grain.

Tulare municipal water supply is being jeopardized by careless users; at times the pumps are unable to lift any water from the wells.

Stratford, Kings County, has appealed to the railroad commission for an order compelling the water company to serve their lands with waste water.

County Sealer of Weights and Measures Johnson of Fresno will aid dairymen in securing correct weights of cans of milk and cream from creameries and separating stations.

San Joaquiu Valley growers recently received checks aggregating four and a half million dollars through the Associated Raisin Company. This represents about $30 a ton on all ralsin grapes.

The forest reserve officials are making a canvass of cattle feeding lands in Inyo County with an idea of securing information as to who are entitled to summer pasture privileges on the reserve.

W. J. Higdon is heading a committee appointed to effect a new organization of the San Joaquin Milk Producers Association. Secretary Ayers will aid in conducting a new membership campaign.

The damage clause in the Associated Raisin Company contracts has been sustained in superior court decision. The damage clause for the coming season will call for two cent payment for failure to deliver.

Southern California

Navels are all shipped.

Riverside's total rainfall for the season is 11.55 inches.

Mill Creek road into Bear Valley, San Bernardino County, has been opened.

Every hay baling crew is busy putting up Southern California's biggest hay crop.

Yucaipa, San Bernardino County, reports almond crop as practically 50 per cent of normal.

Walnut growers at Puente, Los Angeles County, are erecting a $175,000 walnut packing plant.

Imperial County threshing machines were recently stopped for a whole day by a thunder shower.

California Lima Bean Growers Association reports Baby Limas all sold. Price now quoted is $10.71.

San Bernardino County farm bureau is promoting fight against heavy trucking on improved roadways.

Valencia oranges are running to exceptionally large sizes, but are of fine quality and commanding good prices.

The recent light rain in hay growing sections of Southern California is reported as doing practically no damage.

The Yucaipa Apple Growers Association has disbursed $14,000, practically the final payment on apple deliveries, 1919.

Los Angeles County farm bureau is buying soil augers for the use of members in the determination of subsoil conditions.

Brawley, Imperial County's, first full car of cantaloupes went out May 23. Last year's first car was sent out on May 26.

Lima bean growers of Ventura County are making almost daily shipments, and it is hoped the 1919 crop will soon be sent to market.

Several walnut orchards of Southern California are suffering because of winter killing, which is more serious this year than any preceding.

The Arlington farm center has changed its name to the Alvord farm bureau center. This because most of the members reside in the Alvord district.

Some of the burned ovor areas of the Sierra Madre are being reforested. The San Dimas center of the county farm bureau is aiding in planting young trees.

The Ventura County Fair Association invited all members of the association to meet at a barbecue, after which the matter of "greatest county fair ever" was discussed.

Hemet, Riverside County, stands very straight and says: "We have the best hay crop in California." Her apricot crop, however, is reported as less than 50 per cent of normal.

Milk producers of San Pasqual, Ramona and Escondido, San Diego County, recently met with the board of directors of the county association and discussed percontage of butterfat.

A total of eight cars of strawberries has been shipped this season from the Gardena-Moneta district. Owing to the car shortage, express shipments of berries have been unusually heavy. The second crop of berries commenced to come in about May 20 and from all reports will be heavier than the first crop.

The Coast and General

Spokane, Washington, is featuring a "Farmers' Chautauqua," June 24 and 25.

Lane County, Oregon, will hold its county fair at Eugene, September 21-24.

Fruit growers at Langley, Washington, unite in the ownership of a community sprayer.

The farm bureau of Island County, Washington purchased 1771 boxes of stumping powder during the winter season.

University of Arizona reports: "Farm bureau idea gaining strength rapidly among farmers and farm women."

Strawberries are reported as finding slow sale on Seattle, Washington, market High price of sugar is given as the reason.

One farm bureau in Washington purchased nearly 1,800 boxes of stumping powder for blasting, a saving of $3,000 to the farmers.

Farmers in the Walla Walla Valley of Washington report damage exceeding $15,000 annually because of depredations of beavers.

Planting of prune trees has been resumed in the Yakima Valley where several years ago orchards were pulled out because of low prices.

Wheat growers meeting in Kansas City "demand that agricultural courses be revised to educate actual farmers who will return to and work on the land."

State Horticultural Commissioner Dean of Washington has ruled that his inspectors may enter Yakima Indian reservation and continue cleaning up of orchard pests.

The Apple Growers Association of Hood River recently made a distribution of $225,000 on the 1919 apple crop, bringing the total funds distributed to May 1 to growers to $2,000,000.

Arizona cotton growers are uniting to secure a labor supply in time for harvesting this fall. It is estimated there will be needed at least 40,000 pickers to harvest the crop of 285,000 acres in Arizona.

Loganberry growers near Salem, Oregon, who contracted for a term of years to deliver berries at three cents per pound have been given relief by the courts and released from their contracts. The growers are now offered as high as 13 cents per pound.

About 150 milk and cream producers of territory about Spokane, Washington, recently met and took initial steps toward the formation of a dairymen's cooperative association. Another meeting will be held June 15 when it is hoped to formally outline the work.

To cope with the labor shortage in cotton fields of Arizona and California the employment service of the United States department of labor has organized a zone in those states on same lines as the twelfth federal reserve district. District headquarters is in San Francisco.

To determine the value of different commercial fertilizers and their action on various kinds of soil in several parts of Washington, demonstration plots have been started by a soil extension specialist of the state college in ten counties of the state Benton, Skagit, Whatcom, Yakima Snohomish, Kittitas, Lewis and Clarke

Echoes of the Avocado Convention

Extracts From the Addresses

IT is not possible to reproduce all the good things said and read at the fifth annual convention of the California Avocado Association, but the most important committee report was printed in the Cultivator of May 15, and propagation and handling of the young trees will be presented in full, a paper of vital interest to all who grow trees. But there are important and interesting statements from prominent members that cannot well be overlooked.

In his presidential address William H. Sallmon: "It is a satisfaction to be able to state that our affairs are in a sound condition and we are on a firm foundation. We do not have to face the specter of debt for more than 100 new members have been added during the year, making a gain of $500 in our net resources, and with all bills paid we have in the bank a comfortable balance of more than $1,500. . . . With a membership of 161 two years ago and 216 last year, it was felt that we might reasonably seek to attain the 300 mark this year. And it is a pleasure to record that we have done it. There are now enrolled 301 bona fide members, in addition to eight honorary members" (Dr. W. L. Hardin reports 42 also joined during the convention.—Ed.).

Avocados in Florida

From a paper sent by John B. Beach, West Palm Beach, Florida, we take the following excerpts regarding California varieties fruiting in that state from scions sent from local orchards:
